INDEX TO VOLUME 72

HOARD'S DAIRYMAN

From January 10, 1927 to December 25, 1927 — *W. D. Hoard & Sons Co., Fort Atkinson, Wis.*

A

Abortion—.... 46, 164, ... 349, 676, 802, 841
-Agglutination test for 1077
-cures and control.... 995
-Testing for 841
-work in Georgia 783
Acidophilus milk 445
Acid phosphate — Value 14
-vs. bone meal 781
Acres—per cow 758
-Putting vagrant, to work 925
Advertising with milk bottle sign 203
Afterbirth—Retained .. 676
Age—Imaginative 85
-Influence of, on fat percentage 507
Agglutination test 1077
Agricultural appropriation bill passed 76
Agriculture—Decentralization of industry... 368
-Fault with 968
-Frank, Dr., on ..376, 1100
-requires thought 1100
-Teaching, self-reliance 685
-2,000 years ago 233
Alaska Yukon Colantha 326
Alberta Dairy Pool 638
Alfalfa—Bought 964
-campaign in King Co., Washington 119
-culture pointers 315
-experience 1077
-facts—New 318
-fields of Nebraska ...1095
-for human food 248
-for poultry 161
-for sows 69, 1117
-hay—Brown..... 15, 613
-hay—Making.... 657, 801
-hay — Inspecting, for market 5
-hay vs. alfalfa meal 203, 781
-in Ontario 57
-meal for swine 911
-Method of curing ... 694
-Origin 57
-pasture for pigs..... 745
-pasture saves money.. 907
-project of W. E. Spreiter 479
-seed — Foreign, must be stained 569
-seed industry in Idaho 439
-seeding—Shotgun 801
-Top-dressing 696
-variety trials 1056
-weevil 1139
-Why, fails or succeeds 479
Alford, G. C.—Farm .. 529
American—Farm Bureau Federation meets ...1203
-Institute of Co-operation report 768
-J. C. C. meeting 659
Anderson, W.—Farm ..1186
Animal husbandry—Origin 846
Anthrax 420
Apples—Boiled 1161
-for cows 101
-pomace 67
-Preserving, (Mazelin way) 1015
-Storing 1101
-with pork 1162
Argentine dairy industry 851
Arizona's future 968
Arkansas dairy program 501
As the twig is bent ... 30
Atkeson, T. C., retires.. 76
Austrian field pea 131
Auto—Rules for operating human 668
-rules in Minnesota... 570
Autos in U. S..... 382
Average of herd—Computing 507
Ayrshire—Breeders' Association meeting... 654
-breeders of Canada meet 189
-cattle in the U. S.... 59
-champion— Vis Bountiful Lassie 72
-cow—World record .. 318
-Dehorned 487
-herd test 435
-producers — Best, for 1925 59
-records—Highest 59
-score card 99

B

Bacteria count— Reducing 743
Bailey, L. P., Co.—Farm 371
Bananas—Food value... 669
Bandelow, L.—Farm...1064
Banks—Federal Land .. 799
-Intermediate Credit 1135
Barfknecht, F. — Farm 1038
Barley— 902
-compared to corn for dairy cows 1037
-straw for cows 935
-vs. corn 137
-Wis. high protein.... 344
Barn — Calf, from piggery 1047
-sheets—Use of 92
Barns—Cost 1047
-How good dairy, are built 496
-Ventilating 497
Barrenness 295
Barrows vs. gilts 706
Beans—Cull, good feed 67, 258
Betsy Wylie—World's champion Ayrshire.. 318
Bird, E. S.—Records by 327
Birds—With, at Lake Ripley 403
Bissell, T.—Farm 1079
Bjork, C. 774
Black, J. D., goes East 1056
Bloat 458, 539
Blood-building foods ... 950
Boar—Feeding 890
Boer, W.—Farm 370
Boese, A. I., wins trip to Guernsey 192
Bohstedt, G., returns to Wisconsin 1178
Bone—Building (Ed.).. 446
Bone meal—for hens ..1022
-vs. acid phosphate .. 781
Book—Breeding and improvement of farm animals 24
-Butter industry 965
-Byways to health 396
-Care and handling of milk 331
-Chemistry in agri.... 688

-Hay standards 842
-Marketing farm animals 838
-Safeguarding children's nerves 396
-Soil management 1056
-Songs 741
-"The farm" 537
-Veterinary bacteriology 764
Books—Worth-while ... 807
Bordeau mixture 767
Bread—Grape nut 1067
Breakfast—Eat good ..1110
Breed—Choosing 8, 187
Breeding — Loading dice in 1192
-vs. feeding 994
Breeds—Comparing 1078
Brisket swelling 1118
Brooder—house-Building 417
-Size of 354
Brown, A. A., succeeds Lackie 869
Brown Swiss — breeders of America meet ...1104
-breeders of Minn. meet 213
-cattle in the U. S... 113
-Leading, producers in 1925 .....
-scale of points 113
-Ten high producing.. 113
-to Peru 37
Brunswick stew 668
Build on paper first.... 506
Bulbs—Planting 1011
Bull—Age to serve 483
-associations 1137
-Bleeding 914
-calves—Gets only 100
-Daughters of, best index to his value 193
-Exercise for 909
-Impotent 294
-Making, safe 330
-Pasturing herd 538
-Service charge for partnership 187
-yard of J. S. Charles 505
Bulletin—Better cows from better sires .. 278
-board—Kitchen 84
-Minn., on farm survey of Steele Co. 186
-on better calves with dry skimmilk 263
-on computing farm prices 601
-on farm lease in Wis. 445
-on viscosity, tension, and whipping properties of milk and cream 1141
-U. S., on dairy sire's daughters best index of his value 193
-Wis., on debates 452
-Wis. silo 11
Bulletins — farmers'-Send for 738
-of interest ..359, 589, 615, 660, 737, 860, ... 993, 1056
Bulls—Keeping, from killing trees 695
-Proven 766
-Sunshine for 341
Bull's part in reproduction 1073
Burns, R.—Letter by, in 1783 696
Burwell butter factory, Nebraska 383
Butter—Biblical 638
-consumption in Canada 136
-cooking substitutes to be taxed 513
-exhibits of N. D. C. arouse ire of oleo manufacturers 1150
-Good dairy 842
-improvement in Northwest 998
-marketing by Land O' Lakes 840
-More, needed by Land O' Lakes creameries 611
-price and surplus—A. D. Lynch on 562
-scores over coconut produce 3
-scoring contest at N. C. B. A. 66
-Standard of, sold in New York City 248
-substitute referendums 116
-thieves 656, 843
Butterfat prices in Ill.. 627
Buttermakers' certificate 260
Buttermakers — Licensing, in Ontario 728
Buttermilk—for pigs.... 38
-Pink 731
-powder made in Meeker Co., Minn. 326
Buy—How to, cheap... 612
By-products—Pasteurization of, in Granite state 186

C

Cabbage au Gratin 743
Cake—Red devil's food.. 668
-White fruit 1162
Calcium arsenate for alfalfa weevil 1139
Calf—cholera (white scours) 295
-club—Middlesex Co., Conn. 935
-clubs—La Porte Co...1021
-dysentery 1212
-Feeding 275, 390, 848, 1101
-How to fit dairy, for show ring 672
-marking scheme in New Zealand 465
-meal mixture 967
-pens—Dark 294
-Selecting, for club work 625
Calf's navel—Disinfect.. 890
California Cry. Ass'n... 16
Calumella 2,000 yrs. ago 233
Calves—born without skin and with goiter 163
-Calf meal gruel for.. 888
-Dry skimmilk for ... 263
-Feeding, on minimum of milk 1157
-Grain for 622
-How Mrs. A. Peterson feeds 433
-Late winter 514
-Letting young, run .. 591
-made good in Tillamook Co., Ore. 191
-Milk substitutes for.. 967
-Raising, on minimum of milk 394
-Shade for 689
-Skimmilk for 565
-Sunshine for 262, 696
Campbell, M. H., to Vt. 964
Can—How big is.....1047
Canada — dairy production 866
-ships cream to London 1005
-Thistle—Killing.. 731, 973
Canadian prices lower.. 185
Canary Posch Netherland 283
Capital for distribution 1140
Carcass—Disposal 1082
Carrots—Glazed 743
Cart—Hay rope 422
Cattle—crossing sign .. 457
-depreciation 15
-First, in America 188, 1104
-sold in Wisconsin.... 205
-Starving, in a land of plenty 330
-Tick eradication to be stopped in Florida.. 562
Celery club 146
Cereal study 902
Certified milk—and its competitors 473
-Thomson, J. C., on... 512
Challenge Cream and Butter Ass'n.... 16, 130
Cheese—and nut relish.. 579

-round-up 764
-threatens dairy industry (Hanke) 236
Corn—crib and granary 553
-crop—How, is used... 537
-Estimating value of, for silage 317
-for poultry 159
-germination—Vigor of 529
-Harvesting, for cow feed 851
-High testing seed, scarce 387
-Hogging down 809
-Husking, with hogs.. 890
-not enough for pigs 1176
-Raising cross bred seed 388
-Seed, drying plant of J. J. Newlin 388
-Seed, situation 867
-stalks poor feed 150
-substitutes for pigs .. 209
-Value of, for pigs in dung from cows ... 400
-vs. barley for cows ..1037
-What, for silage 744
-White 209
-White vs. yellow, for pigs 585
-Whole soft 67
Correction—on Annis of Walhalla 205
-on Iowa College team 1104
-on Meredith Farm .. 993
-on N. Y. T. B. law.. 998
Correspondence—course in dairying 33
-dairy course in N. D. 1104
Cottonseed meal—poisoning 420
-used as fertilizer 934
Cotton vs. dairy products 307
Courter, Mrs. J. C.—Farm 504
Cow—Acreage per 758
-calling contest 318
-choked 223
-Color of, does not indicate production .. 317
-Community, in S. C. 965
-Cost of keeping 1100
-Drying up 163, 222
-fails to breed 100
-guessing contest at Tex. A. & M. College 68
-Hog—Hen week in Georgia 441, 446
-holds up milk 1118
-leaks milk 637
-loses cud 349
-Making, earn her way 853
-milks hard 747
-mothers pigs 1137
-Self-sucking 223
-tester — Wisconsin's first 114
-tester experiences ... 607
-tester—Experiences of H. W. Hyde as 436
-testing in Illinois 1053
-testing in Ireland ... 196
-testing pays 92, 97, 653, 948
-went wrong in show ring 316
Cow testing association—Change name of, to dairy herd improvement asso. 840
-cows bring good prices 1209
-exhibit at Wis. S. F. 1144
-Ft. Atkinson 1096
-Getting, idea across.. 136
-Hamilton Co., Tenn... 259
-How to keep, alive... 617

-Tour—Washington.... 732
-Tuscola, ... 511
-What, did for H. Edwards 455
-What four years in a, meant to H. C. Vaske 448
-Why join 653
-Wise Co., Texas 408
Cow testing associations—in U. S. 450
-Swedish 1136
Cows—and heifers in U. S. Jan. 1, 1927... 248
-Ave. production of... 800
-Barren 1174
-Better, from better sires 278
-chewing wood — Minerals for 217
-Comparing thin and fat 996
-Do, need exercise (Ed.) 186
-Drying up 45
-eat subsoil 319
-Effect of condition of, on production 450
-Exposing, to storms.. 636
-Feeding dry 809
-Feeding, grain on pasture 391, 409
-Fetching 618
-for creamery 37
-For self-sucking 515
-grade—Registering .. 411
-Grooming 1191
-High, by breeds in C. T. A. 221
-in Denmark 1185
-in Labrador 964
-in U. S., 1840—1926 ..... 800, 927
-Knowing, as individuals 327
-More, from good sires 612
-Overheated 817
-Not more, but better 1046
-Price of record, vs. no records 376
-Treat, well 126
-Will selling poor, result in milk shortage 562
Cowpox 46, 100
Cream—and milk-Sampling 895
-assembling stations in North Carolina 930
-Caring for, in cold weather 25
-Does sour, test more? 577
-grading in Lincoln Co., Kans. 194
-grading in Ontario .. 378
-Holding whipping .. 447
-layer—Relation of, to test 652
-New plan to market, in North Carolina .. 930
-Sampling and testing 563
-screw—Does, regulate test? 320
-Standardizing 507
-station—Co-operative, on Minidoka project, Idaho 279
-To secure thick 1141
-Weight 192
-Whipping 767
Creameries—More, wanted in Land O' Lakes Creameries, Inc. ... 611
-What Ill., paid for fat 627
Creamery — Bloomington, robbed 656

HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

Volume 72, No. 1 Fort Atkinson, Wisconsin

Here's My *new* CUT PRICE CATALOG

FREE

YOU can SAVE a lot of Money this Year

if you will send for my new big CUT PRICE CATALOG. Don't buy a rod of fence, barb wire, gates, posts, roofing and paint until you get this money-saving book. I'VE CUT PRICES to the bone on my 150 styles of DOUBLE GALVANIZED Farm, Poultry and Lawn Fences — Farm, Drive and Walk Gates; on Corner Posts, Steel Fence Posts, and Gate Posts—Barb Wire, Smooth Wire, Grape Wire—Roofing and Paints. Catalog shows a bigger variety than you'll find in a dozen stores and at prices that save you fully one-third or more. Send for this catalog today — compare my quality and NEW CUT PRICES with what you have to pay elsewhere. You'll SAVE big MONEY.

Jim Brown PAYS the Freight

The new low prices in my catalog are *delivered* prices. I pay the freight right to your freight station. You know when you look in my catalog exactly what your goods are going to cost laid down at your freight station. You've no extras to pay. You'll find a big difference in price and a tremendous difference in ***quality*** — for instance — my fence is made of Basic Open Hearth Steel Wire and all ***double galvanized*** by the famous Brown process which puts on twice the usual amount of galvanizing. That's why it don't rust out—why it lasts two or three times longer than ordinary fence. My Gates have Carbon Steel one piece frames—last a lifetime. My Steel Posts are bigger, heavier and much stronger; my Barb Wire and Smooth Wire is the best ever; my Roofing is ***asphalt*** Roofing with ***wool felt*** base—not coal tar and paper; my ***WEARBEST paint*** with its big percentage of Pure White Lead and Pure Linseed Oil is all that its name implies. Just read these letters:

"The 140 rods of fence you shipped me seven years ago is as nice and bright today, with no sign of rust on it. I put up another make of fence about the same time I did yours, and it is very nearly ruined by rust. The Brown Fence is by far the best fence put up in this locality."
John Bruce, Cauthron, Ark.

"I received my roofing in good condition. I feel that I saved at least $1.00 on each roll by ordering from you and if I ever need any more roofing I sure will send you my order for I know I would get the worth of my money. I certainly will recommend your roofing to all my friends." *A. B. Ingram, Eton, Ga.*

"Yours is the heaviest paint I have ever used. It covers better and it goes farther. And my neighbors say it is the whitest paint they ever saw. You saved me $1.30 a gallon." *Harry Thomas, Athenia, N. J.*

Fill Out and MAIL COUPON NOW!

Everything made in the Brown factories is so unusually high quality that it always gives the best of satisfaction as expressed in the letters above. Besides you take no risk in buying from Jim Brown—my unqualified guarantee makes you safe. You have nothing to risk but lots to gain when you buy from Brown. I ship promptly from my 3 big factories at Cleveland, Ohio, Memphis, Tenn., and Adrian, Mich., also shipping points at Kansas City, Mo., and Davenport, Iowa. Fill out and mail coupon today and get my latest New Cut Price Money-Saving Book before you buy.—*Jim Brown.*

MILK STOOL PHILOSOPHY

J. J. SPRENGER, MINNESOTA

SOME time ago a farmer in an experimental way tried to light his house by wiring from a little dry cell battery, reasoning that if a battery could ring the doorbell, it could make a light, also. But he found that it takes more power to make a light than a noise and incidentally he learned one of life's great lessons. We should never talk because we think we have to say something, but because we have something to say. When we are unable to converse intelligently and do not have good sense enough to keep still, then we always discount ourselves. It always takes three things to say something: an occasion, a theme, and a life. However if we have furnished these things and are not heeded, then it is the one who might hear that discounts himself.

Occasions, however, are not made by ourselves but are from time to time offered to us, something like life's opportunities, making it a matter of judgment on our part to make our conversation timely or otherwise. But even tact and good judgment cannot take the place of profound thinking when it comes to making our conversation helpful. As a people, we are too busy to think.

At the beginning of another year we can well afford to stop and think. If we do, we will soon find out that thinking has its rewards, especially when it accompanies our work. Milking becomes a pleasure when we have something good to think about, and the same is true of other work. It is also true that work performed in such a way that it stimulates thinking, always is doubly remunerative.

The highest remuneration that work can offer is in building character. No work is really remunerative unless it helps to build character. In making comparisons of work's remunerations we find there is both a monetary and a character building reward and that as work varies, these rewards vary so that when the monetary reward increases, the character building reward so often decreases. On the other hand, the work which is so often poorly paid for in money brings a rich harvest in that it has built real men and women, and we need often to stop and think of that tireless, poorly paid little mother and the teachers of our youth and let their memory spur us on to see more in our daily work than simply the money that it brings.

"Let us then be up and doing
With a heart for any fate.
Still achieving, still pursuing,
"Learn to labor and to wait."

—LONGFELLOW.

Dairy Butter Scores a Win Over Coconut Produce

HOARD'S DAIRYMAN:—A new friend has been found for the dairy cow—one has been lost to the coconut butter producers of the South Sea Islands. Eskimo pie is the new dairy cow friend—the former friend of coconut butter producers.

Eskimo pie, as most Hoard's Dairyman readers probably know, is merely a little chunk of ice cream which has been coated with a chocolate preparation. In making this chocolate coating, it is the common practice to use coconut butter, but the active brains of C. A. Iverson, L. T. Anderegg, and W. D. Elliott, workers in the Dairy Department at Iowa State College, Ames, conceived the idea of using dairy butter in place of coconut butter. The idea worked. In fact, it worked so well that it may develop into something of great value to the dairymen of the nation.

To give some idea of the importance of this seemingly small item, the Iowa state dairy workers have calculated that if all of the coconut butter used in Ekimo pies were replaced with dairy butter and if the average person in the United States ate just one Eskimo pie each year (some people eat dozens annually), a market for 2,825,000 lbs. of dairy butter would be made. Actually, the market for dairy butter through this source would probably grow a great deal, for the new Eskimo pie has doubled in sales over the old one in Ames. This fact becomes the more notable when one considers that Eskimo pie sales have been dropping off in many parts of the country. In Ames they are taking on new life and this has been the case for several months now—ever since the new pie appeared.

"I do not believe that the demand we have had here for the new Eskimo pie is a mere fad," says Professor M. Mortenson, head of the Dairy Department at Iowa State College, "for this new product has real quality. It is more "tasty" than the old. People relish it more. Then, too, it is actually more nutritious and dairy butter is far more easily digested than coconut butter. If the use of dairy butter increases over the country in these chocolate coatings as we hope it shall, I feel that a fine new avenue of sale for dairy butter will be created."

To test out the preferences for the new and the old Eskimo pies, both were offered for sale in Ames after the new pie had been well introduced. Customers, without exception, chose the new pie and turned down the old. In fact, it was found impossible to sell the old pies after the new ones appeared. At some of the student functions at Iowa State College, as many as 1,000 of the new Eskimo pies have been sold in a single evening this fall.

The new Eskimo pie coating has one big advantage over the old from the consumer's standpoint—it will not shatter when eaten as will the one containing coconut butter. The old coating was brittle and would fall to pieces when one bit into the pie. The new coating made with dairy butter will not do this.

Not only is the use of dairy butter likely to make inroads on coconut butter in Eskimo pie manufacture, but dairy butter may also be used in the chocolate coating for candies and as a coating for the ice cream "lolly-pops," now sold in many quarters. The lolly-pops are merely ice cream on a stick which is dipped in a chocolate preparation.

In order that ice cream manufacturers and the public may become acquainted with the good qualities of the new Eskimo pie, the recipe for making the coating will be published soon in a circular or leaflet which will make it possible for manufacturers in all parts of the country to begin at once to sell the new product. If the Ames sales of the past few months are a fair indication, the new Eskimo pie will be a real friend to the dairymen.

Iowa. FRED E. FERGUSON.

"How is your new hired man?"

"Well," replied Farmer Tompkins, "he broke two hoe handles yesterday."

"Working so hard?"

"No leaning on 'em."

Longer PROTECTION -is yours in every pair!

WHEREVER there's mud or slush, you will find Goodrich Rubber Footwear giving its extra service and longer life.

Millions of feet are enjoying that snug, dry comfort which this footwear can bring to you.

And 65,000 dealers make it easy for you to get this protection.

Ask them for Goodrich "Hi-Press" Rubber Footwear—for every purpose and every member of the family.

The first thing to do in buying Zippers is to look at the flap and find the name.

An instant of caution—and months of satisfaction are yours.

Zippers are made only by Goodrich

The Best Then The Best NOW

Never in the history of centrifugal cream separators has there been a machine equal to the De Laval. Each model has, in its day, been far ahead of all other machines in skimming efficiency, ease of operation and superior durability.

The present model De Laval is the crowning achievement of all. It has the wonderful new "floating" bowl which runs smoother and easier, eliminating vibration and thus making it skim better and cleaner, run easier and last longer.

You will get a richer, smoother, higher-testing cream with this new De Laval—and more of it, too.

Trade Allowance

Old centrifugal cream separators of any age or make accepted as partial payment on new De Lavals. Sold on easy terms from

$6.60 to $14.30 Down the balance in 15 easy monthly payments

Skim Your Skim-Milk

Ask your De Laval Agent to bring out a new De Laval Separator and run the skim-milk from your old separator through it. The new De Laval skims so clean that if you are losing any butter-fat it will surely be recovered. Have any cream recovered in this manner weighed and tested at your creamery, and then you can tell exactly how much a new De Laval will save for you. Trade allowances made on old separators of any age or make.

ARE YOU BUYING HAY?

P. H. STEWART, Nebraska College of Agriculture

RECENTLY an Iowa dairyman, whom we shall call Bill Jones, found that he was going to be hort of winter feed and began look- g about to see where he could buy a ar or two of good alfalfa hay at a easonable price. He found upon in- uiry that the nearest place he could et alfalfa at a reasonable price was the Platte Valley in Central ebraska where hundreds of tons are hipped out annually. It was quite a ays from Jones' farm to this part of ebraska, and besides Jones was busy ith work at home and found it diffi- lt to get away for the 2 or 3 days' me which it would take to make the ip into the alfalfa hay producing lley and hunt up someone who had r sale the sort of hay he wanted.

About this time Mr. Jones heard at at some of the important alfalfa ipping points between Kearney and orth Platte, Nebraska, it was pos- ble to buy alfalfa hay subject to in- ection by a government licensed in- ector at the loading station. The e for such an inspection, he found, as $2.00 per car. This was much ss than it would cost to drive the ord over to the hay country to say othing about the cost for meals, otel, and the time it would take to ake the trip. Upon further inquiry e learned that the hay was being raded according to the new govern- ent hay grades.

What Mr. Jones wanted was good, afy, first-cutting alfalfa free of dust d mold. He was not particularly xious about the color of the hay so ng as it was leafy and good other- ise. Jones found that the sort of y he had in mind would grade under e federal standards, as discussed ter in this article, as U. S. No. 3 falfa," with perhaps the special no- tion of "leafiness good enough for . S. No. 1 alfalfa." He also found at due to the general market prefer- ce for hay with lots of color he uld buy this good, leafy but rather or color hay for considerably less an the cost of hay of equal quality t with better color. So. Mr. Jones nt an order for a car of "U. S. No. alfalfa" and asked that the local in- ector pass on it and furnish a cer- icate of inspection, which he did. r. Jones received his car of hay and und it loaded with uniform hay of e kind grading No. 3 alfalfa.

It is very likely that many other dai- men, feeders, and farmers who must y hay this fall and winter might ofitably buy hay at shipping points bject to local inspection. The saving time and travel expense and the as- rance of getting the kind of hay de- ed at a lower price per ton are the vantages of buying in this way.

Prospective hay buyers may be in- ested in knowing a little more as where shipping point inspection is ailable in Nebraska, who the in- ectors are and their reliability, and to the requisites for the various grades of alfalfa hay under the U. S. Standards. At the present time there are only two licensed inspectors available for shipping point inspections in Nebraska. These men are both located in Dawson County but could be available for Buffalo County inspections with the additional payment for mileage costs to the point of inspection. These inspectors are both experienced hay growers who attended a training course at Kansas City and after passing a strict examination were licensed to grade hay. They are under the jurisdiction of and continually checked up by the federal supervisors of hay grading. Hay graded by these local inspectors, should it go on to the Kansas City or other hay markets, would not need to be inspected there but would sell on the grade given at the shipping point. Local inspection is optional. Inspectors cannot grade hay in which they have any financial interest and the public is assured of impartial, efficient work.

Local inspection of alfalfa hay is now available at several important hay shipping points in Central Nebraska.

Dairymen, farmers, and feeders who normally purchased considerable alfalfa or prairie hay would do well to become familiar with the federal hay grades. These are given in a concise and easily understood way in the "Handbook of Official Hay Grades" available upon request from the U. S. Department of Agriculture, Washington, D. C.

Some hay growers have held that it is impossible to develop satisfactory hay grades which are definite and yet applicable to hay produced in various parts of the United States. A study of the present federal grades will show, however, that standards have been developed which are definite and easily understood yet which are elastic enough to cover all of the important classes and grades of hay that are likely to be produced in commercial quantities.

Alfalfa hay, for instance, is graded on the three factors—color, leafiness, and foreign material. U. S. No. 1 alfalfa must have 60 per cent or more of color, 40 per cent or more of leaves, and not more than 5 per cent foreign material such as weeds, old rakings, etc. The grade is determined by the lowest grading factor. For instance, a car of alfalfa hay might have 45 per cent of leaves and less than 5 per cent foreign material but with only 20 per cent color. Such hay would, so far as leafiness and foreign material are concerned, grade U. S. No. 1, but due to the low color it would grade as U. S. No. 3 alfalfa. The certificate in this case would carry the special notation "Leafiness good enough for No. 1." This would show that the hay was leafy and clean but low in color. Such hay would be typical of alfalfa stacked a little green which would come out of the stack low in color but high in leafiness. For average feeding purposes such hay would be very desirable. Since the market demands a good color for hay of the highest grade, such off-color, but leafy hay, can often be bought at a considerable discount, which makes it a good buy. Much of the first-cutting alfalfa falls in this class.

Hay growers, dealers, and consumers should find when the federal hay grades are generally known and adopted that hay marketing will be better standardized and more satisfactory.

Special provisions are made to take care of hay of special merit such as, for instance, fourth-cutting alfalfa with extra fine color and high leaf content. Hay which has more than 75 per cent of the natural green color in addition to its other grade notations is marked "High Green Color" which indicates that it is especially desirable on the market, having been well cured. If the leaves are clinging and the stems fine, it would also have the extra notation on the grade certificate of "Soft Fine Alfalfa." Thus a very fine, high-quality car of fourth cutting alfalfa would be graded "U. S. No. 1, Soft Fine Alfalfa High Green Color." Anyone who was familiar with the federal grades would know at once from reading this certificate what the hay was like.

Equally definite grades have been worked out for prairie hay which is graded on the two points—color and foreign material. By foreign material is meant weeds, wire grasses, and such sedges and rushes and other plants as are coarse or not suitable for feeding purposes; also other objectionable matter which occurs naturally in hay. Prairie hay as well as alfalfa is put into different classes depending on the kinds of hay present. Thus in prairie hay, if upland grasses such as the blue-stems make up most of the hay, it would be classed as "Upland" and graded "U. S No. 1, 2, 3," or "Sample Grade," according to color and foreign material. If largely slough grass, it would be classed as "Midland" or if a mixture of upland and slough grasses, it would class as "Upland-Midland Mixed."

The reader, if he has had the patience and perseverance to read this far, may have decided in his own mind that hay grading is too complicated to be of much practical value. But after a little study, particularly if the hay is available to illustrate the various points, anyone who had had experience with hay will find that the fede- al grades are simple and that cal, important points are w- out by the government.

Hay can now be b- eral inspection at

THE FEEDING OF DAIRY COWS

Number 6

Knowing How to Combine Feeds to Meet the Requirements of the Herd is the Important Part of Calculating Good Rations. This Article Tells How to do This

IN the fifth article of the series we learned how to determine what a cow of given weight and production needs in terms of proportion and quantity of nutrients. The next step is to determine what feeds and how much of them will supply these requirements and at the same time not violate other desirable requirements of a good ration.

It is not necessary to calculate rations separately for each cow in the herd. What is needed is to put roughages and concentrates together in such kind and proportion as will supply digestible protein and carbohydrates in the proportion of 1 unit of protein to each 6.5 to 7 units of carbohydrates and in addition to this to have reasonable assurance that by varying the quantity of feed to their individual size, production, and condition.

From the many inquiries on feeding cows that come to us we know that right here is the stumbling block. A dairyman has certain feeds and can buy others, how shall he put them together so as to make a balanced ration? This question directly or indirectly comes in every mail. Let us learn how to put feeds together to make a balanced ration. To do this it is necessary that we have before us a table giving the amount of digestible protein and of total digestible nutrients in a given quantity of each of the different feeds that may be used. We publish herewith such a table in addition to which the feeds listed are grouped according to the character of each.

A farmer has a herd of cows that average 1,100 lbs. in weight and produce an average of 25 lbs. of 4 per cent milk daily. He has corn silage and clover hay as roughage and corn and oats as concentrates. He can buy bran, gluten feed, linseed meal, cottonseed meal, and a high grade mixed feed that contains 30 per cent protein. With the information already given in the series and from the table giving the nutrients in different feeds, how can this farmer determine for himself a good ration for his cows?

A 1,100-lb. cow calls for 33 lbs. silage and 11 lbs. clover hay. Twenty-five pounds of 4 per cent milk require about 8 lbs. concentrates when fed 1 lb. for each 3½ lbs. of milk produced. Corn silage and clover hay call for a concentrates mixture containing between 13 and 14 per cent digestible protein. We can't get a mixture of this kind from corn and oats because the table tells us that corn contains only 7.5 lbs. and oats only 9.7 lbs. per hundred. There is no sure way of getting the right proportion of the right feeds the first time. We must proceed on the basis of trial and error. A little practice will reduce the extent of error.

For the concentrates mixture, let us try 3 lbs. ground corn, 2 lbs. ground oats, and 1 lb. each of bran, gluten feed, and linseed meal. Our next step is to find out how much of digestible protein and of total digestible nutrients are contained in these amounts of feed and in 33 lbs. of silage and 11 lbs. of clover hay.

By referring to the table we see that 100 lbs. of corn silage contain 1.1 lbs. of digestible protein and 17.7 lbs. of total digestible nutrients. Set these figures down, multiply each by 33, and divide the result in each case by 100 like this: 1.1x33 equals 36.3, divided by 100 equals .363; 17.7x33 equals 584.1 divided by 100 equals 5.841. By this we find that 33 lbs. corn silage contain .363 lb. digestible protein and 5.841 lbs. total digestible nutrients.

In a similar manner we calculate the nutrients in 11 lbs. of red clover hay. Find red clover hay in the table. One hundred pounds contain 7.6 lbs. digestible protein and 50.9 lbs. total digestible nutrients: 7.6x11 equals 83.6, divided by 100 equals .836; 50.9x11 equals 559.9 divided by 100 equals 5.599. We find that 11 lbs. red clover hay contain .836 lb. digestible protein and 5.599 lbs. total digestible nutrients.

The calculations for 3 lbs. ground corn, 2 lbs. ground oats, and 1 lb. each bran, gluten feed, and linseed meal are made in similar manner by using the factors for each feed as shown in the table. Make these calculations and bring the results of all together in a table similar to the one at the right of the table giving the nutrients in feeds.

The ration contains 2.261 lbs. digestible protein and 17.614 lbs. total digestible nutrients. The 17.614 lbs. include the units of protein and carbohydrates, plus the fats converted to carbohydrate equivalent. To find the nutritive ratio, subtract 2.261 from 17.614 and divide the result by 2.261; the result is 6.7, meaning that the ration supplies protein and carbohydrates in the proportion of 1 unit of protein to 6.7 units of carbohydrates. This falls within the range of a good ration so far as proportion of nutrients is concerned.

One could take other combinations of concentrates, using the corn and oats as the base. The selection of high protein concentrates should be governed partly by price. To make a comparison of prices for different protein concentrates, one divides the price per ton by the number representing the pounds of digestible protein contained in a ton of feed; the result is the price in cents per pound of digestible protein. The selection of concentrates should not be based wholly on this factor because there are values in some feeds above the mere value of the nutrients contained. Take bran, for example, it is worth more than the mere protein it supplies because of its laxative effect and of its bulk. Linseed meal has a very desirable laxative effect. High grade mixed feeds contain a variety of protein sources and ar thoroughly mixed.

Will this ration meet the require ments of the average cow in thi farmer's herd? The ration supplie 2.261 lbs. digestible protein an 17.614 lbs. total digestible nutrient The Haecker standard requirement for a cow weighing 1,100 lbs., pr ducing 25 lbs. of 4 per cent milk, ar 2.12 lbs. digestible protein an 17.247 lbs. total digestible nutrient From this it is seen that the ratio supplies a slight margin of safet a thing to be desired.

From this information this farme would be assured that by feedin corn silage 3 lbs. and red clover ha 1 lb. for each 100 lbs. live weigh and by feeding this concentrates mi ture of 1 lb. for each 3½ lbs. milk produced, the requirements each cow are amply provided for.

In calculating rations one shou never lose sight of the fact that th chief concern of the cow is to g feeds she likes. A perfectly ba anced ration, if not palatable, wou not be consumed in sufficient quant ty to satisfy the needs of good cow A ration composed of 10 lbs. each corn fodder and timothy hay, and lbs. each of ground corn and cotto seed meal is very well balanced far as proportion of nutrients is co cerned but it would soon become u palatable. Furthermore, the feedin of 4 lbs. per head daily of cotto seed meal with these roughages dangerous and besides this the should be supplied a greater varie of high protein feeds, especially non-legume hay is fed.

In the northern states with wint setting in severely nearly a mon earlier than normal, many dairym are beginning to worry about the feed supply. Skimping the ration all the cows in the herd merely stretch the feed over a longer peri is poor business. The problem m be solved by selling two or three the poorer cows or, if all the co are good, by buying more feed. So will run short of silage, others sho of legume hay, while some will n have home grown grains enough hold out if the good cows are ad quately fed.

In any case where it is necessa to make any material change in t feeds used it is essential to check on the changes to make sure the go cows are getting all they need. The is no excuse for putting good fe into a poor cow any time, more esp cially when feed is scarce. One go way of getting more money out the feed one has is to take out t poor cows and feed the good or better. This and previous articles the series tell how to check up the ration.

Knowing how to calculate good tions does not constitute all the sk in getting the most milk from a he of cows at the least cost and w the least wear and tear on the co Knowing feeds and the calculation rations and not knowing cows is mu like the theoretical agricultural ec omist who knows the theories of operative marketing without knowi the American farmer and his agric ture. There are thousands of dai men who are doing a good job of g ting a lot of milk from a herd cows who do not know the arithme of calculating good rations, but th are men who know cows.

The next article will discuss so of the more important factors t have to do with getting the most m from a herd of cows with the le cost and with the least wear and t on the cows.

Kind of feed	In 100 pounds digestible protein	In 100 pounds digestible nutrients
Silage

Trailing Holsteins to South America

JAMES G. BEATTIE, WISCONSIN

JOHN ZOBERLIN AND HIS THREE DAUGHTERS

THIS is the evening of November 25th, 1925, beneath the hospitable roof of John Zoberlin's ouse. The first shipment of a late urchase of Wisconsin Holsteins outound for Chile, S. A., is assembled ere and ready to commence a 55 ays' voyage via New York and Panma. All the tests and vaccinations re completed and satisfactory; only emains the replacement of a few ear ags; the alteration of the ration, hat is, the substitution of beet pulp or silage; the matter of halters, exra rope, blankets, the medicine chest, nd such other tools and equipment as re practical for a trip of this nature.

It is 8 p. m. and there is still one uestion of importance to decide beore the complement for the first hipment is agreed upon. And that uestion is in regard to the sale of ohn's "General Homestead Merceles," the All-American calf for the how season of '24 and '25. Chile is alling for General in terms of much noney, and John can hear their oices without anything in the ir, in the way of static, to obtruct his hearing. Yet he does ot hear. John can't make up his ind to let the calf go. The probem with him is, where can he relace him.

The supper and the chores are one, and the household is gathred around the stove, the air beng snappy and sharp outside. ohn is in the throes of indecision. The Chilean representative s calling him from Philadelphia t midnight for the final "yes" or no." His wife is setting bread, ather unusual nowadays in itchens, and John, big, rugged, nd every inch of him energy, valks across the floor and claps er gently on the shoulder.

"Mamma, what should I do? Should I sell General? What do ou say? You're my wife, my artner in the business, you know. Now, what do you say, anyway?"

But Mrs. Zoberlin was ponderously ilent. She acted as though the quesion was not hers to say, possibly just little removed from her end of the usiness. Anyhow, regardless of what he thought, she said nothing from hich inferences of an advisory naure might be drawn.

"Well, say something once, anyow," repeated John. "Say something. Half of General is yours, you got as uch to say about him as I."

But nothing of note came from this eggary, and so he turned his dark ery eyes my way. But I, like Mrs. oberlin, also replied evasively. For t really was none of my affair and, urthermore, how was I to advise a ersonage so notable as John Zoberlin.

Says he to me, sitting down at last nd knitting his heavy black eyerows, "It's just this way. When I was 15 years old, I came out to this country from Bavaria. I had nothing, no money, nothing. In fact, when I landed in Plymouth I did not have a whole dollar in my pockets. That was 29 years ago, only yesterday it seems like, and now, well here I am. You see what I got. It ain't much from the millionaire's standpoint, but at the same time it is quite a little, too. Two hundred acres of good land and a crackerjack herd is something.

"The first year in this country I worked for $120. Yes, $120." He repeated so as I would not confuse it with $120 per month. "But I saved it, and thank the stars there wasn't autos at that time to get my mind off my aims. The next year I got a little more, and the next year a little more, and so on and so on. From $1,000 I went to $2,000 in a hurry—interest and bigger wages. Then I bought a small farm, and sold it, making a profit; and bought another and sold it again. Then I bought this one and got started in cows. I have been in the pure-bred business and like it. Of course, I have been pretty successful and when a man has success with something, he generally likes that 'something.' He ain't human if he don't.

"I raised the wonderful cow, 'Tilly,' and from the wonderful 'Tilly' came the wonderful calf, General. He has been invincible in the show ring and an animal of such outstanding caliber is the top of every man's ambition who is engaged in the production of cattle with pedigrees. And now," said he, exhibiting two tanned hands, the living proofs of work and hard striving, "here I am at the crossroads, and don't know which way to turn.

"In General I've got something beautiful and a pleasure to look at, and I can keep him on indefinitely as a herd sire. He's the real thing; All-American, you know. It takes a good one to win those honors. But 7,500 one-dollar bills stacked up, one on top of the other, is something else to think about, also. A man has to think both ways, doesn't he?"

John talked along. He told about some notable instances in his herd, of the six 1,000-lb. cows, and the seven 30-lb. cows, of the two junior 3-year-olds that made world's records last year, all, in the final analysis, the product of genuine intelligence and toil.

The time wore on. Midnight in Philadelphia was 11:00 p. m. Plymouth time, and promptly on the hour a wire was cleared between the two places and a conversation begun that seemed to have no end. The after midnight rate was 40 cents a minute. The discourse lasted 72 minutes, and when John came out of the stuffy telephone booth, he said the sweat was running down his boots. And from the flush on his face one had no reason to contradict him. But he announced, with a smile, that General would go in the first shipment.

"I sure hated to let him go, but I believe I used the right judgment just the same."

UNLOADING THE WISCONSIN HOLSTEINS FROM THE SHIP AT VALPARAISO, CHILE

We went back to the farm then, for John had no telephone in his house at this writing, and went to bed as it was already late for farmers to be out.

Mr. Murphy, Murphy Farms, calls John "The Flying Dutchman," which, as far as I can see, is a good nickname for him. Seeing the big, good-natured man on the move, of mornings, between pigs and milk cans and cows, and trying at the same time to cater to the appetite and whims of 150 Leghorn pullets which he has geared up to around 75 eggs daily, one can understand how it was that Murphy thought of it.

This scene at John Zoberlin's was merely the prelude to the rather tempestuous journey on which I was to embark in taking Holsteins from Wisconsin to South America. We were to go by rail to New York, take ship there, pass through the Panama Canal, and thence down the west coast of South America to Santiago, Chile. There we were to leave our ship and by rail take the cattle to their new home, a large ranch at San Vincente.

This was not a new venture for these South Americans, for they had already built up a large Holstein herd, but they wanted this new blood from Wisconsin. It was, however, a new venture for me, a farm boy raised near Chillyville, Wis. I was to cross the equator and would be broiling in the hot sun of the tropics when the folks at home would be shoveling snow and eating sausage and pancakes. While I was to see new sights, yet to do so I was to be nurse maid and chore boy to twenty-five Holsteins of royal blood and royal price. But the work caused me no apprehension, for I had been raised with cattle and chores were an everyday thing, but little did I appreciate the difference between chores in the barn at home and on board ship in a stormy sea. Those who follow my "log" (I learned this word at sea; at home we would call it a "diary") as it appears in the next few issues of Hoard's Dairyman will learn, perhaps, some agricultural geography and something of the meaning of a ship voyage on a tramp steamer.

(EDITOR'S NOTE:—This is the first of a series of articles by Mr. Beattie on "Trailing Holsteins to South America." The next will appear in an early issue.)

OHN ZOBERLIN AND HIS GREAT COW, "TILLY," THE MOTHER OF "GENERAL" THAT WAS SOLD TO A SOUTH AMERICAN DAIRYMAN

THE NEW HOME OF THE WISC... AT SAN VINCENTE

Dry Skimmilk

In 100 pounds of dry skimmilk or skimmilk powder there are approximately 8 pounds of calcium and phoshates, 38 pounds of protein, 50 pounds of milk sugar, 1 pound of fat, and 3 pounds of moisture. In other words, 5.16 pounds of dry skimmilk will supply 5 pounds of food solids, which is equivalent to that found in 17.8 pounds of evaporated or condensed skimmilk, or in 55 pounds of liquid skimmilk.

Dry skimmilk is highly digestible and will supply on the average as many calories of energy as 2 pounds of beef, 1⅓ pounds of cheese, and as much protein as 1½ pounds of beans, 2 pounds of lean beef, or 3⅓ pounds of eggs.

These and many other interesting facts concerning the use of dry skimmilk are told in a very interesting and attractive bulletin by Professor H. E. Van Norman and published by the American Dry Milk Institute, 160 No. La Salle Street, Chicago, Illinois.

WHICH BREED IS THE BEST?

The Answer is Generally Unsatisfactory for There Is No One Best Breed. There Is Greater Difference in Profitable Production Between Cows Within a Given Breed Than Between the Average of the Cows of Each of the Several Breeds. Consideration of Markets and Individual Preferences Will Largely Govern the Choice

FORTY years ago this publication made the statement: "The most profitable dairy cow does not belong to any one breed. At least it has never been demonstrated that she does."

The substance of this has since been given many hundreds of times to beginners with pure-breds, and to old-timers who want to back up and start over. Usually the inquirer does not believe this. He cannot understand how one who is familiar with all breeds has failed to pick a "best one."

When Bill Smith and his boy have threshed out the question and young Bill has shamed and coaxed and finally threatened to leave home unless better cattle are kept, they want action. Having already waited twenty years or so to begin with pure-breds, they don't want to waste any time in choosing a breed. When Bill "takes his pen in hand" and writes his dairy paper the simple question, "Which is the best cow?" he is disappointed to receive the oft written reply, "There ain't no sech animal."

So, his editor having failed him, he chooses a breed. Maybe he likes the color of a certain "kind o' cow." Perhaps he chooses because of size or disposition or because some persuasive neighbor argues him into a decision. Sometimes he takes a certain breed because his neighbors have it, though nearly as frequently a breed finds favor with him because his neighbors do not have it.

Which One Do You Like?

There are a number of factors worth considering when a choice is necessary. Any one of them may be a sufficient reason for choosing a particular breed. If Bill Smith and his boy study them all intelligently, they have a good basis for deciding which is to be the breed of their choice. For, while it may not be said in general that any breed excels all others, it cannot be doubted that under the particular conditions of the Smith farm some cow has the qualities to meet the requirements so well that for the Smiths, at least, she is "the best cow."

If a man is prejudiced for a certain breed so he cannot give fair consideration to the virtues of others, his choice is made. Even though another were better suited to his use, it is time wasted to try to persuade him of its superior points. If he has "hankered" for a herd of certain colored cows for years, no other breed will suit him so well and it is doubtful if another would bring him equal profits.

Probably more men choose a breed for the rather indefinite reason that they "like it" than for any other. There is no argument which will shake a decision made on this basis—the opinions of others and all the arguments in the world are of no consequence. It may be said, however, that such men usually have sufficient enthusiasm for such a choice to be successful even under adverse conditions.

Geographic Adaptability

The claim used to be made that certain breeds were better adapted to some particular section than others. With that proved, the choice of a breed might be made by a man's post office address. If he lived in Maine or Georgia, for example, climatic conditions would automatically dictate his breed of cattle, or if he lived in rough country a different kind would suit his needs than would be wisely selected if his farm were in the plains district.

It was once held that the Jersey was "tender" and not hardy enough to withstand the cold winters of the northern states, but years ago the Roycroft herd earned its high rank among producing Jerseys in the Upper Peninsula of Michigan and Plain Mary, former Jersey champion, made her wonderful production in Maine. Attendants at the National Dairy Show at Syracuse saw a wonderful producing herd of Jerseys from North Dakota and close to the Canadian line.

The claim has been made that Holsteins are not adapted to southern conditions. Nevertheless, many black and whites are doing splendidly there. Where they have failed to make good, the factor limiting their production was in most cases underfeeding. Also, Ayrshire enthusiasts assert that their cow is best qualified for use in rough lands; that she is a hardy grazer. Yet it is well proved that any cow must be well fed before her milk flow commands much attention and that it is not profitable to force milking cows to gain their livelihood on indifferent grazing.

It appears, therefore, that a study of geography is not important in deciding upon a breed.

What is Your Market?

The market may determine the breed. Profitable sale of milk, either for city retail or to those cheese factories which do not buy according to test, may require quite a different animal than where the products of the dairy are manufactured into butter. If a basal price is set for 3.5 per cent milk and a premium of $.40 per pound is paid for butterfat in excess of this requirement, a Holstein breeder supplying a product averaging a content of 3.4 to 3.6 per cent has a marked advantage over a breeder of Jerseys whose milk tests 5.3 to 5.6 per cent fat. On the other hand, where the market prefers a high fat content the lower testing Holstein is less in favor.

The rich color of Guernsey milk gives it popularity with those who can build up a select trade which is often willing to pay a good premium over the usual market price of milk. Ayrshire milk testing 3.8 to 4 per cent finds special favor with many dietitians and makes strong claim to special advantages as certified milk.

When it comes to quantity production of butterfat, the equality of the capacities of the breeds is remarkable. There is some difference in the cost per pound, however. In public tests the high testing breeds have been somewhat more economical in making butterfat. In the Wisconsin cow competition where figures were taken under farm conditions, the advantage of the Jersey over the Guernsey was slight but over the Holstein it was of considerable importance. But in most public tests the advantage shown has not been sufficient to indicate a great difference in economy under every day farm conditions. And balanced against this is the greater quantity of milk credited to the lower testers. The fact that one breed or another holds certain records gives little indication of what may be expected in Bill Smith's barn.

Market Price of Breeds

The market value of the different breeds is a question to consider. During the boom period of 1918 to 192 when all prices were up, Holstein and Guernseys headed the list and i many sections it was hard to pur chase good producers at prices whic would make them profit making mem bers of a dairy farmer's herd. Toda the tops of those breeds and of th others still sell high, as they should but it is quite possible to buy eithe Holsteins or Guernseys at price which make them profitable dair cows. A few years ago Brown Swis were not popular but today $300 isn any special inducement to offer midwest breeder for just a fairl good Swiss cow.

Each breed has its ups and down of prices. If the sale of breedin stock is the ultimate goal, the begin ner must take his gamble with all th rest, that one profiting most who ca best anticipate a breed's boom perio If immediate yield at the pail is prime consideration, the lower price breeds unquestionably offer the bes opportunity to the beginner with limited amount of capital to invest.

Sometimes excellent opportunitie are offered to purchase an entire her or a smaller group of animals at lo prices. When such a chance present itself, a man does well to begin righ there, regardless of the particula herd book in which those animals ar registered.

What Do the Neighbors Own

Here is a real basis for a choic "What do the neighbors own?" If th predominant breed in the locality i registered with the American Jerse Cattle Club, there is likely a good rea son for its popularity in the com munity. Find out why this is so.

Innumerable instances illustrat the folly of simply choosing "some thing different." No one is more lone ly than a single black and whit breeder in a Guernsey neighborhoo and no one has more handicaps in hi struggle to success than a lone Jer sey owner in a section where th Brown Swiss cow is in predominat favor.

In a community where one bree is greatly in the majority, the begin ner who makes his start with it fall heir to advantages he cannot other wise have. Buyers are drawn ther by the numbers of the breed whic can be seen, so that surplus stoc brings good prices at private or pub lic sale. Better bulls are available fo use than the beginner can afford t

What I am Trying to Do on My Farm

The Problem of Soil Fertility

W. J. DOUGAN, WISCONSIN

IT is conceded everywhere and by all classes that agriculture is *the* basic industry. If agriculture is prosperous, all other industries will flourish. If agriculture languishes, it affects all activities of commerce and industry. Indeed, the very existence of the race depends upon a permanent agriculture.

In the field of agriculture itself, the maintenance of soil fertility is the basic factor. With a fertile soil we can build and equip houses and barns, schools and churches, roads and factories. A thriving, industrious, and cultured civilization will spring from a fertile soil. On the other hand, with an impoverished or barren soil all must languish and die. Therefore, soil fertility is the problem of first importance to the farmer and to society.

I am handling this important problem on my farm in this way. First, *I know my soil.* In Wisconsin, as is the case in many of the states, we have established, in connection with the soils department of our agricultural school, a State Soils Laboratory where the individual farmer may send samples of the soil of his farm and have it analyzed to determine the elements it needs for best plant growth. The laboratory returns to the farmer an analysis of the soil and recommendations for improving it.

It is out of reason for a busy farmer to conduct an experiment station in actual farming. This work requires time, trained workers, and expensive equipment; and for these farmers to try one fertilizer one year and another the next to find out what his soils need, is like the Irishman with his horse. Pat was teaching his horse to work without feed. Just as Pat got him trained well, the horse up and died. So with the farmer who tries one experiment after another, for by the time he finds what is best, the farmer up and dies.

Fortunate it is that the accumulation of knowledge, skilled observation, and expert judgment of science is at the farmer's command. I use the facilities of the experiment station to the limit. Every field on my farm is analyzed. I know what it needs. I am fortunate in not needing to apply expensive commercial fertilizers. Most of my fields need lime from two to four tons per acre, and they get it. The other element that must be supplied from without is phosphorus. I have bought some rock phosphate, but am finding that an abundance of manure from a herd fed on a ration containing purchased bran and oil meal is putting back into the soil the elements sold off in milk.

Every soil needs humus. I am supplying the soils with this in growing legumes, clover, and alfalfa. The latter is also a great nitrate factory. Therefore, my soils are cheaply and abundantly supplied with nitrogen.

To avoid impoverishing a field for a single crop or putting the soil elements out of balance, I rotate crops. I have a double system: the clover rotation and the alfalfa rotation. Clover rotation is four or five years; corn, one or two years; small grain seeded to clover one year; clover hay or pasture one or two years; then manured and back to corn. The alfalfa rotation is not so regular. I first get a field alfalfaized; i. e., fitted and accustomed to growing alfalfa. This takes about eight years. Then seed it to a variegated variety of alfalfa and hold it to alfalfa for five or more years, giving it a coat of manure and a thorough discing each spring, after the second year. When it is broken up, I keep it in corn two or three years and then back to alfalfa.

I practice thorough and careful tillage. The best man on the farm is put on the plow, and I follow his work carefully. When a poorly plowed field is disced and harrowed, the eye cannot detect the shallow plowed places and the balks; but the sensitive plant roots, in search for available food, know where these places are and tell in the plant structure they are able to raise.

We try to conserve the soil fertility by keeping down weed growth. It is a harder drain on a field to raise a crop of weeds than a crop of clean corn.

These methods are giving results on my farm. My fields are alfalfaized. I can raise alfalfa with certainty and in paying yields. When I began farming, I shipped in carloads of alfalfa hay. I came to the conclusion that if I put into my soil a fraction of what I was paying for freight, I would be able to raise my own alfalfa. For several years my herd has reveled in the best of hay, and I always have a little with which to help my neighbors in the spring.

Corn is a sure crop even though we are north of the corn belt. It is sure because I have a fertile soil that can force its growth and maturity under half favorable conditions such as we experienced in 1924. I filled two fifty-foot silos with clear well matured corn. I had one field of ripe corn to hog off and another field of ripe corn cut and shredded for grinding. I had a one hundred per cent corn crop garnered that year, largely attributable to a fertile soil.

Can a soil be maintained in its fertility year after year and century after century? The Chinese have been maintaining an immense popu'ation on sections of their soil for over forty centuries and many of their little farms are more productive today than centuries ago. The time has come when we American farmers must give close attention to this basic problem of agriculture.

This is a 10-acre field being put in prime shape for seeding alfalfa clean culture. The operation is going over it with a weeder to stir surface and kill weeds and conserve moisture.

I wish to place emphasis on one word in the title of this series of articles—the word TRYING. I am well aware of how far I fall short in actual accomplishment. However, I am sure that holding high ideals in farming, and a constant striving to attain those ideals, makes for better farming and better living. It is these principles and ideals I wish to hold up to you. I will use my own farm and my own experiences to illustrate these truths.

ALFALFA FIELD ON THE FARM OF W. J. DOUGAN

Milk While They Learn

CLYDE DUNCAN, ARKANSAS

WHEN school opened this fall at Magnolia Agricultural School, which is one of the four district agricultural schools in Arkansas, there were fourteen boys and girls on hand to start again to earn their way through school by milking cows furnished them by the school. The idea of permitting students to have the use of a cow or possibly two cows to help them defray expenses was first put into practice three years ago by H. B. Shiflett, head of the animal husbandry department. He got permission from the school authorities to let those students have a cow, to pay the students for the milk that their individual cows produced, and the students in turn pay the school for the amount of feed their cows consumed. This meant that the students were paid for their labor in a way that causes them to better understand dairying while it gives to them practical experience which is invaluable.

ONE OF THE BOYS MAKING BUTTER AT MAGNOLIA AGRICULTURAL SCHOOL

"When the plan was first started," said Mr. Shiflett, "we permitted the students to bring in their own cows. That first year there were twenty-eight cows brought to the school dairy barn from the nearby farms by students. Of these twenty-eight cows only three remained after three months, as we proved to those students that their cows were unprofitable and that they were not getting paid for their labor. We gave to them some of the school's pure-bred Jerseys and Holsteins and suggested that they keep in mind the things that they had learned about their unprofitable cows brought from home.

"You know," continued Mr. Shiflett, "I worked my way through Oklahoma Agricultural and Mechanical College and I have always felt that the plan we have here would work. We are following the merit plan of helping our students. A student that we feel is deserving is given a cow by the animal husbandry department. The student milks the cow, in most cases three times per day, and the milk is recorded on the daily milk sheet which we have here in the dairy barn. At the end of the month these figures are added up and the student is paid at the rate of 3c per pound for the whole milk. The net profit, which is what the student gets for his labor, will be the amount after the cost of the feed is taken out except that in the case of the girls the cost of cleaning the barn is deducted.

"You will see," Mr. Shiflett said,

GIRLS WEIGHI

Live Rubber••

One reason why "U.S." Blue Ribbon Boots stand the hardest farm wear

HERE'S a real test. If you cut a strip of rubber from the upper of a "U.S." Blue Ribbon boot—it will stretch more than 5 times its own length without breaking! Under the roughest treatment on the farm this rubber stands up!

This "U.S." Blue Ribbon boot is right all through. The gray sole is as tough as the tread of a tire. And at every vital point from 4 to 11 separate layers of tough fabric and reinforcements are built in to give *extra* strength.

Seventy-five years of experience in making waterproof footwear is back of "U.S." Blue Ribbon boots and overshoes. They look better, fit better, wear longer. Get a pair—you will notice the difference.

United States Rubber Company

"U.S."
Blue Ribbon Boots
are made of high-quality rubber—flexible, long-wearing. They have sturdy gray soles, uppers red or black—in knee to hip lengths

Trade Mark

The "U.S." Blue Ribbon Walrus
slips on right over your shoes. Its smooth rubber surface washes clean like a boot. Either red or black—4 or 5 buckles

"U.S." BLUE RIBBON
Boots Walrus
Arctics Rubbers

Trial of a 325-Pound C. T. A

JERRY N. SPENCER, IOWA

THE Linn County Number 1 Cow Testing Association of Iowa stepped from an average of 275 pounds fat per cow to 325.9 pounds fat per cow in two years. Located in the little Quaker settlement near Springville and Whittier, this association started operations June, 1923, with a group of co-operators who have ability to work together without strife or rivalry. This commendable spirit during three years has brought results.

The remarkable accomplishment from the standpoint of increased and more economical production, community pride in better live stock, and general community development is worthy of note. The dairymen are leading in a change from timothy hay to alfalfa hay; from ear corn to a well balanced home grown mixture. Other changes in dairying are commensurable.

Dairying in this locality was not a new thing as most of the members had dairy cattle of mixed breeding and were using pure-bred sires, which is rather unusual in a new association. They were on the right track and by the assistance of the cow tester were able to increase their stride in developing their herds.

At the close of the first year, there were 162 cows that milked nine months or longer and during that time produced an average of 275 pounds fat; this being 17 pounds more than the average cow testing association cow in Iowa. Of the 162 cows, 105 of them produced 300 or more pounds fat. This fact is rather significant when records show that only 15 cows produced over 300 lbs. fat in the first Linn County Association which operated eleven years ago.

Second Year Testing

The interest of the members was consistent and at the close of the second year 194 cows averaged 301 lbs. fat; 105 of the 194 cows finishing the year produced 300 or more pounds fat. It will be noticed that there were more cows milking nine months the second year than there were the first year. This is accounted for by better feeding and management which always tends to lengthen the milking period.

It was not difficult to reorganize the association for the second year as the members had told their neighbors of the results they had received the first year, and most of these first year members continued to test. As a result there were more prospective members than could be accommodated.

Third Year Testing

The third year started operation with more than half of the original members who of course took the lead. Thirteen of the pioneer members at the close of the third year had an average of 364.4 pounds fat per cow, which is 54 pounds higher than they had at the close of the first year. At the close of the third year, all the pioneer members had an average of 300 lbs. or more of fat, except one which fell below only a few pounds, most of his herd being first calf heifers.

The herd having the highest average production for any association year in Linn County is owned by L. F. Bedell. This herd of eight cows produced an average of 8,685 pounds milk and 468.3 pounds fat for the year ending July 1, which is the third year the herd has been in the association.

The first year Mr. Bedell was in the association his herd of six cows averaged 5,605 pounds milk and 260 pounds fat. This was 15 pounds of fat per cow below the association

LINN COUNTY NO. 1 ANNUAL PICNIC AT WHICH TIME AND PLACE THE ASSOCIATION REORGANIZED

THE BUSINESS END OF A 325-POUND C. T. A.
Left to right—C. R. Mills, director; B. W. Heald, vice-president; L. C. Adams, tester; E. W. Hoge, secretary-treasurer; John Miller, director; L. F. Bedell.

verage, but Mr. Bedell did not give p (as is sometimes the case), but nstead set in with the determination o improve. The first step was to sell ix tailenders for $338, putting anther $300 with it to buy five good rade cows for $125 a head. Two nore were purchased at public auction, one for $43 and the other for 45.

The cow purchased for $43 produced 500 pounds fat this year, making almost $200 above feed cost, while the $45 cow produced 425 pounds fat showing a profit above ost of feed of $155.

At the close of the second year he herd of 9 cows averaged 5,774 ounds milk and 295 pounds fat per ow. This was an increase of 35 ounds fat per cow. This was conderable encouragement to the young airyman and stimulated feeding and nanagement which brought about the emarkable results of the third year f an increase of 173 pounds fat per ow, leaving an increased profit per ow of $65 over the previous year.

When the association reorganized or the third year, the usual annual icnic was held at Whittier. The litle meeting house was filled to the rim. All enjoyed a good feed after vhich the business meeting was held.

In Iowa a cow producing 300 ounds fat under farm conditions is profitable cow, and it is every test- r's aim to develop a so-called 300- ound association. This has been exeeded in Linn Number 1 Association n three years' testing, as 326 cows veraged 325.9 pounds fat per ow; 131 of the 326 cows produced 00 or more pounds fat in the year nding July 1.

Fourth Year C. T. A. Spreads

It is apparent that the members of inn Number 1 Association are after he greatest profits at the lowest cost, s every member that was in the asociation the third year rejoined for he coming year. Since there were umerous other farmers that wished o become members, the association vas divided making two associations.

Not only has the association work rown but the number of fields of eguminous crops have kept pace with he rest of the program. During the ast year the number of members rowing soy beans increased 50%, he number growing alfalfa increased 00%.

Feeding practiced in the associaion is not guesswork. Mr. L. C. dams, the tester, makes a continual tudy of feed markets; meal and ther feeds are used when the price ill justify feeding them. All but aree of the third year members have silo and every member feeds a alanced ration.

It is the aim of the members and ester at all times to make the reatest use of home grown feeds. o do this they plan to grow the roper kinds of feeds and get the rgest yields possible. After growig this feed, they are striving to arket it in the most efficient way nd the cow testing association is lazing the trail by making it possible or these farmers to solve their own airy problems.

New Silo Bulletin

Wisconsin now has 110,000 silos, ccording to the bulletin, "Cost of illing Silos," by P. E. McNall and . A. Hartman issued recently by ie Wisconsin College of Agricul- ire, in which several interesting and aluable facts are brought out. The iore intensive dairy districts of the ate have from 60 to 92 silos for very 100 farms, while the whole ate averages 54 silos for every 100 arms.

Some 8,800,000 tons of dairy feed an be stored in Badger silos. Valued at $4.50 a ton, this silage represents a total of $39,600,000. The cost of filling silos is about 40 per cent of the total cost of silage. A reduction of one-eighth in the filling costs, or 25 cents a ton, would amount to an annual saving of more than $2,000,000 to Badger State farmers.

Investigations on 282 typical Wisconsin farms showed that the average cost of filling the silo was $2.06 a ton. The four items of machinery—engine, ensilage cutter, corn binder, and wagons—make up 46 cents or 22.4 per cent of the total costs. The cutter accounts for half the machinery costs. It was found that large silos use machinery more efficiently than do small silos.

Which is more economical, to own or to hire an engine and cutter? Farmers with silos of less than 100 tons capacity can hire them as cheaply as to own them. Farmers having large silos can fill them about 11 cents cheaper a ton by owning their engines and cutters provided they use this machinery as much as is ordinarily used in a silo filling ring.

How far can a man afford to haul silage? Should corn be grown in one or two fields nearest the silo at the expense of interfering with crop rotations, in order that the haul may be short? These investigations showed that the length of haul is of minor importance. An increase of a quarter mile in hauling adds less than 9 cents a ton to the total cost of filling.

A 150-ton silo is usually filled at a cost of 50 cents less a ton than a 60-ton silo. It costs less per ton to fill a large silo, not so much because of the direct effect of size upon costs, but because of its indirect effect upon machinery, silo, and labor.

Uncle Ab says the man who works the hardest may not get as much done as the fellow who seems to work less but has learned the best way to do the job.

RED RANCHER
A buckled non-leak boot to wear over your leather shoes. Built of tough snag-resisting rubber, reinforced at every point of strain.

For All Weather Wear

Your tiresome work is finished in half the usual time when you wear Firestone Red Ranchers, because warm, dry feet make days seem brighter and burdens not so heavy. Wear Red Ranchers and be comfortable in all kinds of weather. They are the farmers' ideal all year 'round footwear for work requiring protection to leather shoes.

The Firestone Red Rancher is built by the manufacturer of Gum-Dipped Tires; maker of highest quality products for twenty-six years.

Look for "The Mark of Quality," it is your insurance of superior merchandise.

Where the going is rough, you need rugged strength

A LIGHT, snappy racing car is all right on a smooth track but for rough work in the fields, only a tractor will stand the gaff.

A light, natty all-rubber arctic may look good in the store but out in the mud, slush and oozing muck only a substantially-built arctic like the Top Notch Corn Belt can stand up for the long pull.

Corn Belts have the substantial body and powerful strength to withstand that tough going long after frail, flimsy all-rubber arctics have cracked under the strain.

We make Corn Belts of the toughest, strongest rubber and *plenty of it*. Every layer of that specially compounded rubber—every strip of reinforcement—is put in because our years of experience have proved that they are necessary to resist the hard punishment which all-rubber arctics get.

Waterproof from top to toe. Easily washed. Fits so snugly that it keeps snow and dirt from working back of the buckles. Made in both 4-buckle and 5-buckle styles, with red uppers and gray soles, fleece-lined, for men, boys and youths.

Rubber footwear for all the family

BOOTS, arctics, heavy and light rubbers, all styles and sizes for men, women and children. Ask for Top Notch Rubber Footwear by name and look for the Top Notch Cross. The best stores carry it or will get it at your request.

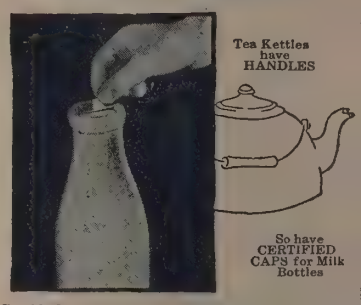
Side Lights On Co-operation

A CORNELL, IDAHO

No. 3

SELF preservation is the first law of nature and selfishness is the practical embodiment of self preservation. Individualism is simply the long established institutionalized form of selfishness and it still has world wide recognition and application because of its primitive adaptability.

Now if it could be maintained that individualism is selfishness and that co-operation is the absolute opposite of selfishness, then it might be maintained that individualism, because it is rooted in human nature, must always prevail and that co-operation, because its success rests upon the necessity of an impractical transformation of human nature, must always fail. However, analysis will show that co-operation is no less selfish than individualism. The difference is that co-operation is broad and enlightened selfishness, while individualism is narrow and sordid selfishness. It must be admitted that, thus far, the practical application of the broad and enlightened selfishness that we call co-operation has been thwarted by the narrow and sordid selfishness that we call individualism.



When we state that thus far enlightened selfishness has been thwarted by sordid selfishness, we imply that the contest is still on and that it will continue until supremacy rests with enlightenment. It is the age-old conflict between sordidness and enlightenment. We all contribute, one way or another, to this conflict and the degree of our personal enlightenment determines to which contestant we make our contribution.

It is quite the fashion to condemn co-operation as a workable procedure because of the repeated failures that have been made to embody it into the industrial and commercial experience of the community. In view of these many failures, we must pause long enough to philosophize a little on the question of human progress. Is progress in human affairs made by the process of making forward strides that are so well timed and calculated in advance that immediate and positive success is guaranteed, or is progress made through the monotonous and discouraging and blood-sweating process of trial, and stumble, and failure?

From our observation of infants learning to walk, would we not say that because a baby topples and falls many times in his attempts to walk, it would be absurd for us to say that trial and failure prove a thing impossible of attainment? Moreover, by having intimate knowledge of the life history of one generation and all the implications connected therewith, we assume that we have an understanding of the life history of the human race, which is to say, as the individuals of one generation learn to walk by many trials and failures, so the human race, in its infancy, became a true biped in the same way. As the infants of one generation learn to express themselves by means of oral and written symbols through the laborious and discouraging process of trial and failure, so the human race has attained its present masterful proficiency in communication through countless generations of perseverance in the face of trial and failure. As the primitive and untutored childish manifestations of one generation of infants is brought into domestication and civility by parental and social restraint which consists of line upon line of moralizing precept and example, so racial mestication is being accomplished a like and proportionately tedi manner.

Every trial in co-operation con tutes a mental contact that makes contribution to co-operative c sciousness. Since co-operative c sciousness is attained through p sonal association, every person wh interested in progress can afford associate himself with at least co-operative enterprise, a cheese f tory or creamery, or telephone co pany, or a poultry and egg associati

Better Caps Cost Less!

Certified Caps for Milk Bottles are easy to lift. They have flaps made of tough red fiber—stapled on. They are easy to see, easy to grasp. They do not tear. Customers prefer them.
Hundreds of dairies have found Certified Caps with Red Flaps the best paying investment they ever made for the same cost. They actually save you money and we can prove it. Make us do it.
Certified Caps with Red Flaps are distinctive. They are a mark of better service. They win customers that stick.
Perfect for capping machines or for hand capping.
Write us, or ask your supply house for free samples.

MILKS 18 to 40 COWS an HOUR

Milks 2 to 4 cows at a time—18 to 40 an hour. Clean, convenient, easy to use. Recommended and used by leading dairymen and farmers because it milks just like the human hand. Easy on the cows—many report enough increased milk yield to easily pay for it in a short time.

$35 Puts it Milking for you

Comes Complete with ENGINE or electric MOTOR

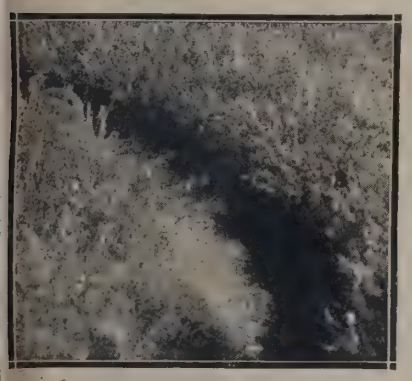
No Installation Expense
Ready to start soon as uncrated. Comes complete with 2 HP engine or electric motor. No extras to buy—no installation cost—no pipes. Saves time and will easily do the work of 4 milk hands.

30 DAYS TRIAL—Any responsible farmer or dairyman is welcome to an absolute 30 day trial. You must be satisfied or no sale and your money promptly refunded. Guaranteed for 10 years. The Ottawa will not only save you a big part of your purchase price but may be paid for out of milk sales if desired.

FREE—Our book "The Truth About Milkers" tells you all about it—illustrated—answers every question. Write—a post card will do. Free—all charges prepaid.

The TRUTH about MILKING MACHINES

Ottawa Mfg. Co.
225 White Street Ottawa, Kansas
225 McGee Bldg. Pittsburgh, Pa.



or a vegetable growers' union or an insurance company or a flour mill. To associate oneself with a co-operative organization means more than the mere buying of one or many shares of stock and the membership that goes therewith. It means an active interest in the problems of the organization's growth and service and in the character and ability and energy of those who keep its accounts and manage its affairs.

In our next installment we will point out some of the difficulties that confront all boards of directors of large organizations and offer some suggestions calculated to help clear up the confusion that so often spells disaster.

Lespedeza Keeps Soils From Washing

HOARD'S DAIRYMAN:—The one plant which, more than all other agencies combined, has kept southern soils from washing away is perhaps lespedeza, or as it is more frequently called in the northern portion of its territory, Japan clover. Kentucky farmers, in particular, owe a huge debt of gratitude to this plant which they have generally despised. In recent years it has spread naturally into southern Ohio, Indiana, Illinois, Missouri, and Kansas. Indications are that it will soon be an important forage plant even further north.

A volunteer stand of lespedeza in red top, holding the soil from washing.

In Kentucky for the past 40 years Jap clover has volunteered in fields laid out to rest. Generally such fields have been cultivated in corn or tobacco for several seasons and the volunteer stand of Jap the first year is thin. Every plant matures from five to a hundred seeds which grow the next year and a sod forms in three to four years. No matter how poor the soil, or how sour, or how unproductive for other reasons, if anything grows Jap will make a stand. This prevents erosion. Not even crab grass, broom sage, foxtail, or plantain, the universal flora of poor fields, will make a sod so quickly, so completely, or with so much benefit.

Lespedeza furnishes untold quantities of grazing under these most unfavorable conditions. The forage is equal to alfalfa or sweet clover in feed value and it will reseed under very close grazing. In fact, in addition to holding the soil from washing, it adds to the fertility. The largest yield of dark tobacco on the Mayfield experiment field has been secured from a plot following Jap clover.

A bushel of seed weighs 25 pounds. This quantity of seed scattered on an acre will make a perfect stand. The same rate is used for seeding gullies, steep slopes, banks, etc. where the wash seems beyond control. Even though a solid stand of Jap may be sowing on the level parts of a gullied field, the sides of the washes will not sow Jap unless the seed is actually sown there at the proper time in the spring. Seed produced in the field is sown so close to the ground that land has no chance to spread it. There is no other seed known capable of making good growth under such conditions.

When gullies form in lespedeza fields the first plants to grow on the little islands in the bottom are lespedeza. The trouble and expense of throwing a little seed on these washes is the least a man can do to the old or newly washed fields and nothing else that can be done will be as productive of good results. Excellent pastures can thus be made out of fields whose owners were ashamed of them. Pasture worth $10 to $15 per acre from June to November can usually be obtained, if not the first year, at least by the second. There is no further expense after the first sowing because it reseeds naturally. Just how far north this reseeding may be expected to be satisfactory is not yet known. It is very good in all parts of Kentucky in normal seasons.

RALPH KENNEY.
Kentucky College of Agriculture.

Rich Soil

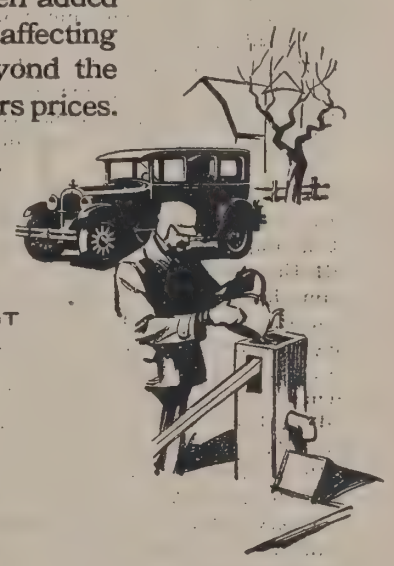
Two farmers were arguing about the fertility of the soil of their respective states.

"Why, the soil is so rich in my state," said one, "that a man with a peg leg daren't stand still for five minutes. The wooden leg will grow roots."

"That's nothing," the other farmer responded. "Back where I came from the land is so rich that all the peglegged men carry hatchets so they can chop off the twigs that keep sprouting on account of all the nutritious dust in the air."—Farm Life.

A Good Cold Weather Starter

Now More Dependable than Ever



Probably no single feature of Dodge Brothers Motor Car has been more widely talked about and commended than the power and promptness of the starter.

The *new* two-unit starting and lighting system now advances Dodge Brothers leadership in this important respect still further.

There are now no moving starter parts when the car is in motion—no starter chain—no noise—no wear. The new starter is even more DEPENDABLE than the old, and far simpler and more compact in construction.

Many other major improvements have been added during the past twelve months, all vitally affecting performance and increasing value far beyond the apparent measure of current Dodge Brothers prices.

EDITORIAL COMMENT

DAIRY farmers who deliver milk and cream to Harrisburg, Illinois, will organize a milk bargaining association for the purpose of securing a fair price for their products. For a long time milk prices have been unsatisfactory, due to factionalism existing between dealers and various groups of farmers. According to a report of the Illinois Agricultural Association, dairy farmers who supply Harrisburg with milk state that the dealers have been playing one community of dairymen against another community in the sale of milk. This is an old scheme and results in price slashing until the price of milk becomes so low that dairying is unprofitable. It is sensible and wise that farmers should organize for the purpose of securing full market price for their products. They not only benefit themselves, but also dealers and consumers, when they place themselves in position to do business on a proper basis. Milk is too important a food to have the supply jeopardized by an indifference in its production.

EVERY YEAR IT HAPPENS

A big factory in our town shut down its shops the other day to take inventory. The shops were closed for several days until every piece of machinery, every piece of stock, and every piece of equipment could be accounted for and valued.

Every year this factory goes through such a performance. And this is by no means the only place where this is done. Every business everywhere, that amounts to anything, takes an annual inventory.

The shops may lay off their men and get behind in their orders at the factory, but that makes no difference. It is imperative that they know how they stand with the world.

Inventory time has arrived for the factories. It has arrived for the farms. The best time to take farm inventory is generally between January first and when the spring work starts.

For the farm inventory make a complete list of the value of all that you own and all that you owe. The difference between these two figures represents net worth or true financial standing.

There are on the market several good farm account books. These cost little, are a great help in taking farm inventories, and should find a place on every farm. Farming is a business and it should be regarded as such.

A FARM AND A HOME

"What I am Trying to Do on My Farm," is the title of a series of articles which will appear in Hoard's Dairyman, the first article being published in this issue. These articles were prepared by Mr. W. J. Dougan, a successful dairy farmer in Southern Wisconsin, and they relate his farm practices and what he is striving to do to make an ideal farm home.

Before becoming a farmer, Mr. Dougan was a Methodist minister but was forced to give up this profession because of impaired hearing. He had experience in farming in his early youth and when he was forced to leave the ministry, it became his ambition to be a successful dairy farmer and to produce and distribute the best quality of milk, for he recognized then its importance as a food for human beings. The time Mr. Dougan spent in the ministry did not unfit him for hard work and he has made an unusual success. He has worked hard but, fortunately, has had the help of an unusually good wife. This, with good health and a determination to succeed, has given him the distinction of being one of the best dairy farmers in Southern Wisconsin.

I desire to commend these articles because [illegible]sent practical information on operating [illegible] dairy farm where the choicest food [illegible]. There is threaded through each [illegible]deals which are stimulative and [illegible]rm life. The person who is [illegible]v to operate a dairy farm [illegible]e an ideal farm home, and to participate intelligently in the activities of his community, should not neglect to read these articles written by Mr. Dougan.

SOILS LACK PHOSPHORUS

The one element of fertility which is likely to be lacking in the soil is phosphorus. This is especially true of upland soils that have been farmed for many years. Investigations conducted by various experiment stations in the use of phosphatic fertilizer indicate in no uncertain terms the value of applying phosphorus when the soil does not have an adequate supply of this element. Crop yields are limited and very often the process of ripening, especially of corn, is delayed.

When a farmer goes to the trouble of plowing a piece of land, preparing it for seed, planting it, and harvesting it, it is wise to have the land in a good state of fertility. It is better to farm five acres well than to farm ten acres poorly, as it is quite possible to make the five acres yield as much as the ten, and the work of operating five acres is much less.

The Wisconsin Experiment Station has found, in all its field tests in Racine County, that acid phosphate increased the yield of barley 14 bushels to the acre, and the yields of alfalfa for two years following barley more than paid for the cost of the phosphate used. It has been our observation that if the soil is properly fed for growing alfalfa, it is less likely to winterkill.

A good practice to determine whether the land needs phosphorus or not is to take an acre and apply 250 pounds of acid phosphate or some other kind of phosphatic fertilizer and then note the yields of this land as compared to that next to it. A test of this kind is simple and informs the farmer whether or not he will be justified in applying phosphatic fertilizers to his land.

DIVERSIFICATION

There seems to be a misunderstanding in the minds of some men as to what constitutes diversified farming. A speaker discussing farm relief legislation said: "Diversification will not improve agricultural conditions. For example, the cotton farmers of the South will not be benefited by growing more corn and less cotton. They turned to the growing of more cotton because beef was unprofitable and, as a result, there is an oversupply of cotton." He also stated, "Some wheat farmers grew corn when wheat was cheap and then there was an overproduction of corn in the fall of 1925 and the price became ridiculously low."

It is evident this man does not have a clear idea of what constitutes diversification in farming. Swinging from one crop to another does not constitute diversification. In every instance he cited, it was still a single crop system. Diversification in farming means the growing of several crops and, as a rule, the keeping of live stock.

We recently talked with a dairy farmer who raises beans, hay, and potatoes as cash crops. He said beans were a poor crop this year but the price of potatoes made up for what he lost on the beans. If he had been a single crop farmer growing nothing but beans, he would be in rather close circumstances, but with a herd of good dairy cows and growing potatoes as well as other crops, 1926 was one of his most profitable years. Surely this farmer was benefited by diversification. We believe that agricultural sections now devoted largely to one crop would be benefited if they grew more crops and adapted their production, in part at least, to what could be consumed in their own section.

The South buys much feed for its live stock and this year its farmers paid over thirty dollars a ton for alfalfa hay. There is a chance for such farmers to diversify and improve their incomes. Midwest farmers are buying alfalfa hay from the West at $25 to $30 a ton. These farmers would profit by growing less corn and more alfalfa. The farmer of the West who grows alfalfa hay receives a low price for it. The cost of marketing amounts to about $20 per ton. Very little of this $20 falls in the pockets of the farmers. Most of it would if they practiced diversification to a larger extent, and this would benefit agriculture.

WASTING FEED

Much feed is wasted by not supplying the dairy cow with the right kind of meal mixture to make a balanced ration with the roughage fed to her. Our attention was recently called to a cow producing daily 29 lbs. of 3% milk and receiving 14 lbs. of meal, a waste in this case of 6 to 8 lbs. of meal a day. This loss could be avoided and the cow fed better if her owner understood a few of the simple rules for making a suitable milk ration. The 14 lbs. of meal contain no more protein than the cow needs to supplement the roughage she is being fed. It contains a low percentage of protein and to provide all the protein requirements of this cow, 14 lbs. of it must be used.

This system of feeding is not only wasteful but it is very likely to injure the cow. Few cows can consume 14 lbs. of meal daily for any great length of time without showing effects of overfeeding. A cow that can eat this much meal and remain in good health is worthy of more intelligent feeding.

What this particular meal mixture requires is the addition of some feed or feeds rich in protein. If a richer meal mixture were fed to this cow enough protein would be supplied in 6 to 8 lbs. of it to produce 29 lbs. of 3% milk. Millions of dollars' worth of feed are wasted because the meal mixtures fed to dairy cows do not supplement properly the roughages fed to them.

In the articles we are publishing on feeding the dairy cow, we are trying to teach a few of the principles and practices to be followed in feeding her. They are not intended to be a complete treatise on the subject of feeds and feeding, but to relate only a few simple truths on feeding that must be known if dairy cows are to be fed properly and the wasting of feed eliminated.

DAIRYMEN AWAKEN

At the annual meeting of the American Dairy Federation, Dr. E. V. McCollum made some rather pointed statements concerning the lethargy of the dairy industry. The results of his investigations to determine the food value of milk and its products are worth millions to this great branch of agriculture every year. He sees opportunity for the dairy industry to profit still more if it fully grasps its opportunities.

One who reminds another of his shortcomings and especially in plain, direct language, is indeed a good friend. We grow and develop through sermons of this kind. What Doctor McCollum said should be a challenge to every branch of the dairy industry and lead to greater activity in its development. "The dairy industry," he said, "has prospered and grown because of the assets handed to it—not from the work of or by itself. The industry has done very little in an organized or effective way for itself." He cited the accomplishments of the National Dairy Council as an exception, but this splendid organization has only gone a little way in the direction that needs to be explored to the fullest extent. He characterizes the efforts of rival concerns to take away each other's customers as silly and wasteful. This same amount of money and effort expended to produce new business would be constructive and more productive.

The dairy industry has failed to take advantage of its opportunities, to promote its own interests. Competing industries have taken advantage of research and educational work to advance their own interests and they use shrewd, high-sounding but only partly true propaganda.

We need more Doctor McCollums everywhere to awaken this great slumbering industry to its possible opportunities. No industry in this broad land is so important to the welfare of the nation and no industry offers larger opportunities for extending and developing itself than dairying.

Sterilizing Dairy Utensils

In the November 10 issue, was an article on the use of sodium hypochlorite as a sterilizer. We would like to get information on this. How is this solution made? What amount would you use to a gallon of water?

Grundy Center, Iowa. E. A. H.

It is possible to secure good results in sterilizing dairy utensils by the use of various chemical compounds. Such compounds are on the market under various trade names and good success has been reported with them. These compounds are usually hypochlorite of either calcium or sodium, and their efficiency depends largely upon the presence of available chlorine.

A home-made solution can be prepared as follows: Dissolve the contents of a twelve-ounce can of chloride of lime in two gallons of water. After standing for a time, strain off into an earthen crock or glass jar, discarding the sediment. Cover and keep in a cool, dark place in order to preserve the solution in its original strength. This is known as the "stock solution" and it will keep a long time.

To make the chlorine solution in which the utensils are soaked, use one pint of the stock chlorine solution to every eight gallons of water. This is at the rate of about one ounce of solution to a gallon of water. Make up a new solution every day, and do not use the same solution for rinsing too many articles. The utensils should be thoroughly washed prior to rinsing in the chlorine solution, as the presence of slime or dirt in the utensils will destroy the usefulness of the solution as a sterilizing agent. After rinsing, either turn the utensils upside down to drain in a warm, dry place or, preferably, set them on the stove or heater so that they will dry out quickly.

To make assurance doubly sure, the utensils are sometimes rinsed out just prior to milking, but care should be exercised in this event to make sure that none of the solution is left in the utensils, as otherwise it may make the milk taste and, as indicated in the article referred to, may possibly bring the milk under suspicion by health authorities

Brown Alfalfa Hay

Does alfalfa which has gone through a sweat and heated and browned in car have the same feeding value as before? Please tell us of experiments along this line, so we can either recommend off color alfalfa to our farmers or tell them to buy it at a certain margin under good alfalfa.

Moline, Ill. A. A. T.

We have had growers in the alfalfa regions tell us that they liked to sell their "pea-green hay" and reserve for their own use the brown or so-called "tobacco-cured" hay. They tell us that if there is no external moisture on the hay, there is no danger of mold, provided the hay has been evenly and thoroughly distributed in the mow or stack. This brown hay is very appetizing and cows eat it eagerly.

Scientists tell us that the fermentation through which this hay has passed destroys a certain amount of its nutrients, but we are of the opinion that ton for ton, the brown hay will contain quite as many nutrients as will the "pea-green hay." In addition, the brown hay when properly made and when not moldy or dusty, will possibly be somewhat more digestible, and at least will be more palatable.

We have had but one report as to a scientific trial as to the relative feeding value of brown hay and the green hay. At the Kansas Agricultural Experiment Station it was found in feeding steers that brown hay was about equal to good green cured alfalfa hay, but that where the fermentation process had gone so far as to make the hay black, it was of little value.

Most of the farmers reporting on this, particularly dairy farmers, state that the only disadvantage with the brown hay is that cows like it so well they may be inclined to eat too much of it. They tell us that it is very efficient in the production of milk on their farms, and their own experience has been that cows eat this brown hay with more relish. It has an aromatic odor when taken from the mow and is well liked.

If the brown hay has a goodly percentage of leaves attached to it, we would be inclined to prefer it to the "pea-green hay," particularly if the usual concession in price can be obtained. Of course, if the hay is moldy or dusty or is lacking in leaves, then it would not be comparable in value to the other and leafier hay.

If the hay specifically referred to in this inquiry actually turned brown in the car, rather than in the stack, there is a possibility that it may be somewhat moldy. If this is not true and the hay is otherwise of good quality, the fact of its being brown or tobacco colored would rather add to than detract from its value in feeding dairy cows.

How Much Linseed Meal?

Is there any danger of overfeeding linseed meal? How many pounds can be fed to a cow giving 60 lbs. of milk daily without harming the cow in any way?

Ely, Iowa. G. B.

Feeding excessive quantities of linseed meal is not dangerous in the same sense that the term "danger" is ordinarily considered. For example, feeding excessive quantities of cottonseed meal over extended periods is dangerous to the extent of causing reproductive difficulties and even death. This is not so much so with linseed meal. There are, however, certain objections to feeding excessive quantities of this feed. For example, large quantities of silage or other succulent laxative feed with excessive quantities of linseed meal would cause a looseness of the bowels beyond a desirable condition and would prove somewhat detrimental because of this. Another objection to feeding excessive quantities of linseed meal is that of cost. When one can buy protein considerably cheaper in other feeds it is not good economy to supply so much of it in linseed meal. The feeding of excessive quantities of linseed meal would limit the variety in feeds, particularly protein feeds. Variety to a high producing cow is desirable from the standpoint of palatability and also as to supplying protein of more complete character.

For a large cow, 1200 lbs., producing 60 lbs. of 3.5% milk daily, a ration of 36 lbs. of silage, 12 lbs. of alfalfa hay, 5 lbs. of ground corn, 4 lbs. of ground oats, 3 lbs. of ground barley, 2 lbs. of bran, and 3 lbs. of linseed meal would meet the requirements. If more linseed meal is fed in this ration and less of corn, oats, or barley, there is more protein supplied than is needed. If a non-legume hay were used in place of alfalfa hay more protein would be required in the concentrates mixture. Instead of increasing the proportion of linseed meal it would be better to use some of gluten feed, cottonseed meal, or some of a high grade mixed feed containing not less than 30% of protein. The need for a greater variety of protein feeds is because of the character of timothy hay.

While one could use more than 3 lbs. per head daily of linseed meal it would be better, everything considered, to meet the nutrient needs of a cow from a greater variety of feeds, particularly when it comes to supplying protein.

Profit Sharing

I have recently started as foreman on a large dairy and my employer has suggested that we work out some plan so that I would get some percentage on milk produced. Can you give me an outline of some other farms working along this line?

Moline, Ill. H. M. R.

The arrangement for profit sharing upon the basis of milk produced is not wholly satisfactory because of the tendency for the foreman to feed for high production without regard to economy of production. We would be inclined to favor a profit sharing plan based upon the return above cost of feed. This would do away with the evil of basing the return upon the amount of milk and yet would work satisfactorily for both employer and employee. The employee would be compensated for his efficiency, and the employer would gain from this inducement to efficiency.

What proportion of the return should be paid is open to some question. We do not know of any place where this plan is in operation, although there are, doubtless, farms that have some such system of profit sharing. Most cost accounting studies indicate that the cost of feed will average nearly 60% of the total cost of producing milk. We are under the impression, however, that on most farms as they are conducted it is safe to estimate that feed accounts for 70% of the actual cost of producing milk. However, using 60%, and assuming that the value of the production from a fair to good average cow will be $180 a year and her cost of feed will be $70, it would mean that her total cost of producing milk would be $116 a year, leaving a profit for this good cow of $64. This would indicate that if the foreman were to receive 10% of the actual profit produced by a cow, he would receive in the neighborhood of $6 per cow per year.

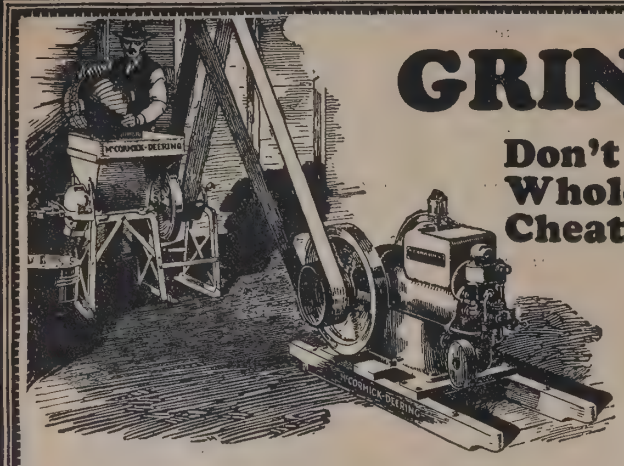
Instead of using this form of computation, one might accept the figure of 5% of the value of the production over and above the cost of feed. It would seem that a percentage figured on some such basis as this would prove satisfactory and offer the foreman considerable interest for high and economical production of milk.

If any readers are operating on a profit sharing basis we would be pleased to pass on their method to others.

Cattle Depreciation

Kindly advise what would be a fair depreciation to allow? What would be the average length of life and the value for the different years of a cow's life? This is for a pure-bred Holstein herd, well taken care of but not forced, kept in well lighted and ventilated quarters, and free from tuberculosis, and assuming that it cost $150 to raise a heifer until she freshens at 24 to 30 months of age.

Hubbard, Ohio. L. W. S.



The method of estimating depreciation of cattle requested has been largely given up because it is rather difficult to establish depreciation in this manner and have it represent true conditions unless a herd is unusually large.

It is generally estimated that, taking all things into consideration, the usefulness of a cow in a herd will extend for an average of about five years. This takes into consideration those which are discarded because of poor production, accidents, or some other reason before they have reached maturity, as well as those mature cows that may stay in the herd for ten years or more. On this basis it has been suggested that yearly depreciation could be ascertained by dividing by five the difference between the original cost of the animal and her estimated beef value. Under conditions such as cited, it is possible that one would be justified in increasing the years of usefulness to six and possibly seven years.

A somewhat better method of arriving more accurately at the depreciation in a herd is to inventory the animals at the beginning and end of the year. It is suggested that each animal be listed at the beginning of the year with its age and value, and at the close of the year the estimate of the value again be made. The difference between the totals would represent the actual depreciation or appreciation of both the individuals in the herd and the total for the herd itself. In estimating values, the cows may be compared with other animals that have been sold in the same vicinity or one may be able to secure some well informed individual who will be able to value the animals with a reasonable degree of accuracy. It is rather necessary to register the age of animals, as cows and heifers normally increase in sales value for the first few years while the older cows decrease in value with age.

If the herd is a grade herd, or even if a pure-bred herd, it may answer every purpose of accounting to establish a standard value for each class of animals in the herd, For instance, we know of one dairyman who values his grade cows at $100 each, his grade heifers at $50 each, and his grade heifer calves at $25 each. He estimates that this is about 20% under their actual sale value, but by retaining this same method of valuation year after year he is able to make a reasonably fair comparison of his profits from year to year. His pure-breds he values at double these prices except for those purchased during peak prices and which he now carries at half their cost.

If these same values are maintained from year to year and a reasonable effort is made to maintain the herd in productive condition, the total values at the end of the year would represent fairly close the gains or losses that should be credited to each year. In order to not reflect the market valuations from year to year, which do not really enter into the farm profits and money available, it is quite wise to adopt reasonable valuations for the herd slightly lower than what would be considered a fair average of their sale price. If sales are made above or below this price, the gain or loss during the year would, of course, be properly credited in the cash income of the farm with a reduction in the number of animals that go into inventory. In establishing sales value, consideration should be given to the number sold for beef because of poor production, breeding, etc. Over a series of years this will amount to, perhaps, 5 to 10 per cent of the total cows in milk.

GRIND!

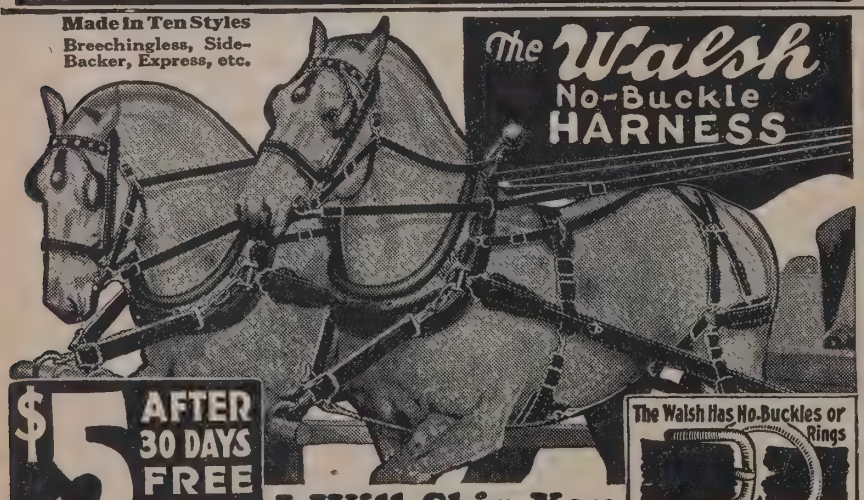
Don't Let Whole Grain Cheat You

WHOLE GRAIN is bulky and it fills the animal's stomach, but it cheats you by satisfying the hunger through this bulk rather than through complete nourishment.

Tests have been conducted by Government stations in past years, with healthy, full-toothed animals, to determine the seriousness of these feeding losses. The tests show an average loss of from 12 to 26 per cent. In other words, out of every 100 bushels of whole corn fed, 26 bushels yield practically no nourishment while passing through the digestive tract. The unground oat diet showed a similar loss of 12 bushels out of every 100.

Such feeding losses can easily spell the difference between possible loss and a handsome profit. Many farmers are putting various combinations of grains through the McCormick-Deering Feed Grinder, assuring their animals a nourishing ration that is quickly and completely assimilated. In the interests of greater stock-raising profits, investigate the McCormick-Deering at the local dealer's store.

McCormick-Deering Feed Grinders—built in three sizes from 6" to 10", requiring from 3 to 16 h. p. according to size and type. Designed to grind various combinations of grains and forage crops.



McCormick-Deering Corn Sheller—for every need; ranging from the 1-hole steel hand sheller to the power cylinder sheller of 350 to 400 bushels per hour capacity.

McCormick-Deering Engines—full-powered engines with removable cylinder, enclosed crankcase, magneto ignition, efficient fuel mixer, etc. Sizes: 1½, 3, 6, and 10 h. p.

a Walsh Harness for a 30 day free trial on your own team. See for yourself that my harness is stronger, handsomer, better fitting, handier in every way—a proven success for over ten years. If not convinced that it is the best harness you ever laid eyes on, send it back at my expense.

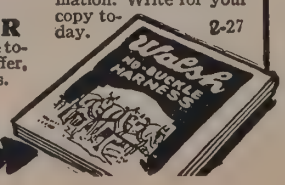
Three Times Stronger Than Buckle Harness

Buckles weaken and tear straps. Walsh 1⅛-inch breeching strap holds over 1100 lbs. The same strap with buckles will break at the buckle at about 350 lbs. pull. Ordinary harness has 68 buckles. Walsh Harness has no buckles. Easy to see why Walsh is three times stronger than ordinary harness. Packers' Northern Steer Hide leather—best that can be tanned.

SAVES REPAIRS—LASTS TWICE AS LONG

The Walsh Harness costs less because it saves many a dollar in repairs. Users show average repair cost of only 9 cents per year. No patching, no mending, because no rings to wear straps in two, no buckles to weaken tear straps. Greatest advance in harness making. Easily adjustable horse. Write today for new reduced prices.

Over 70,000 Users Praise the Walsh



Endorsed by Agricultural Colleges, Government Experiment Stations, leading horsemen and thousands of users in every state.

OR MY FREE BOOK

A California Creamery Association

JAMES M. MURRAY, CALIFORNIA

STARTED in 1911, in Los Angeles, as a sales agency for a large California co-operative creamery, the Challenge Cream and Butter Association has grown from selling about a million and a quarter pounds of high grade butter, during their first year of operation, to the point where they are now marketing more than 25 million pounds yearly, dealing direct with hotels, restaurants, and retail stores.

Taking their butter to the consumer, rather than jobbing it out to speculators, has not only meant better business for the creameries on their butter, but also a better deal for the grocer as well as a better buy for the hotels and restaurants. By cutting out intermediate handling, the advantages of direct dealing are obtained with better satisfaction to the creameries, the grocers, and the consuming public.

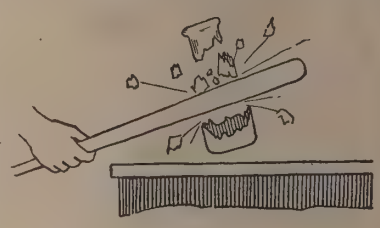
After achieving a phenomenal success in the Southland of California, the company bored its way north until, in September, 1925, they broke into the great field of San Francisco, including the surrounding bay cities, by opening up a sales agency at 807 Montgomery Street, which operates under the direction of O. J. Kennedy. Mr. Kennedy has been prominent in the butter, cheese, and egg trade of the bay cities for more than 20 years, and he understands thoroughly the needs and problems of the retail grocer in this field. C. W. Hibbert is the general manager and head of the Challenge Association, and has been the prime mover in the expansion of the organization from the date of its first inauguration.

Coming into San Francisco, this cream and butter association found a relic of war days still in existence in the form of a fictitious daily paper quotation which would lead newspaper readers to believe that the grocer was paying approximately 3⅓ cents less for his butter to the jobbers than was actually the case. The jobbers and speculators were making about 8 cents a pound on their handling of butter, whereas the grocer was selling on a margin of about 5 cents per pound, with, of course, the high expense to face that is inevitably associated with retailing.

Within a month after arriving in San Francisco, the Challenge Cream and Butter Association announced the adoption of a new selling policy on butter. They began selling butter at the price actually quoted by the San Francisco Produce Exchange for extra grade butter, which meant a reduction in price to the grocer of 3½ cts. per lb., and removed from him the stigma of profiteering with which he had, in the past, been accused.

This feature of co-operation with grocers and the retail trade generally, added to the exceptional merit of the products of the company and the high quality of service rendered, gave the new butter competitors in this field an opportunity to make a hit with the trade. And this hit is a palpable one, as is proved by the fact that Challenge and Modesto butters, sold by this association, increased in turnover from 3,500 lbs. per day at the beginning of the San Francisco campaign, to approximately 25,000 lbs. per day, with prospects good for still further increases as time goes on.

The Milk Producers' Association of Modesto, the largest co-operative creamery plant in the world, is the main supplier of the butters handled by this association, with the Danish Co-operative Association of Fresno a close second. In addition, there not being sufficient butter produced by even these two great dairy concerns to supply the needs of the selling association, the butter of 15 other member creameries is also handled.



"We have emphasized quality in taking butter for sale from our creameries," said Mr. Kennedy. "Uniformity is assured for us because we personally supervise the dairy operations. We have field creamery operators, experts in the business, who go to each creamery and standardize their output.

"The quality of the cream and the salt and the color of the butter all are subject to our standardization methods, and we can say that all of our butter is manufactured from sweet cream, whereas most other butters are from centralized creamery plants not up to our standards.

"While this is an expensive inspection service in point of cost, in the end we are saved a great deal of trouble and expense on the selling because we know that our butter is absolutely up to specifications, is produced under favorable conditions of sanitation, and can be priced and handled as a single article.

"In addition to butter, we also handle for our dairy members eggs, cheese, and condensed milk, giving them opportunity to market all of their products through us, under the same advantageous conditions as is handled butter.

"Our direct service to retailers is the best that can be devised. We serv-

Nobody does this to your bottles

THATCHER
Bottles
can stand almost anything but wilful intent to break them

ACTUAL experience of dairymen and exhaustive laboratory tests have definitely proved Thatcher Superior Quality Bottles are the hardest on the market to break. But no wonder! They are scientifically constructed to resist breakage.

The use of only the purest flint glass, perfectly tempered in lehrs used by Thatcher exclusively, makes Thatcher Bottles stronger, tougher and more uniform in quality than any other milk bottle made. If you want "more trips per bottle," use Thatcher Superior Quality Milk Bottles. Our Trade Mark is blown on every Thatcher Bottle for your guarantee and protection.

Posters for advertising bottled milk are supplied free to dairymen who will use them on their wagons. Several factories assure prompt deliveries. Write today for samples and prices of Thatcher Bottles.

e the large stores daily and the small- ones two or three times a week.

"In addition to 14 trucks operating and out of San Francisco, we have uck service extending up the coast ne from San Diego, in the South, San Francisco, besides which we ave trucks operating out of interior ties such as Fresno, Tulare, Modes-, and various other points where re located our branch plants. In os Angeles there is a great fleet of 5 trucks which supply the surround- g countryside with our products.

"At the present time we are rep- esenting 17 co-operative creameries, 2 of which are located in California nd 5 in other states.

"Our operation has been a great uccess from the start, and we have ever failed in our efforts to get es- ablished in any new city we have ackled."

A Friendly Breeders' Club

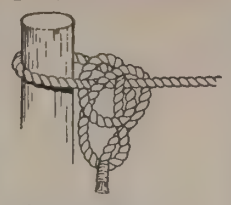
HOARD'S DAIRYMAN:—In the spring f 1922 about half a dozen Guernsey eople met and organized the Pierce ounty, Washington, Guernsey Breed- rs' Club. From the beginning they ave held that the foremost object hould be good friendship toward all

Farmstead on Rainier View Guernsey Farm, Washington, where A. O. Johnson has developed a herd of 40 pure-bred Guernseys from two foundation cows purchased in 1913.

reeders. Whether they have accom- lished their aim or not is very well idicated by their recent summer eeting held at Rainier View Farm, uckley, Washington, at which time out 150 Guernsey breeders met in eir beautiful grove to do honor to eir Guernsey cow.

The breeders of this county have ac- mplished great things. This has en due very much to the fact that ey have always attempted to develop closer friendship amongst all mem- rs. They have promoted their breed making exhibits at the Western ashington Fair, by having all their rds in the cow testing association, d making improvements in the rds by the use of good bulls. Now ey are making great advancement producing a clean Golden Guernsey oduct and promoting the sale in the st markets.

The Rainier View Guernsey Farm, vned by Mr. and Mrs. A. O. Johnson, as been quite successful in develop- g a herd of 40 Guernseys from two imals purchased in 1913. Their rm of 110 acres is located in the ade of the beautiful Rainier Moun- in. In 1913 they purchased two re-bred Guernsey females and the ernsey bull, Governor of Fernwood, om this original foundation.



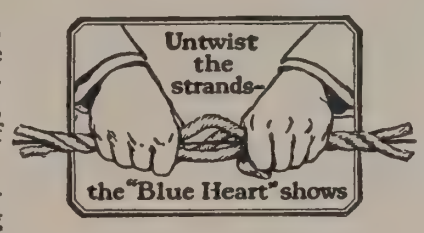
In addition to these 40 descendants om the original animals which they ve in their herd, they have sold females and 27 bulls. Their herd has ways been free from tuberculosis d at the present time is free from portion as shown by the blood test.

They have 65 acres under cultiva- n which produces sufficient hay and her roughage for the cattle and rses. The only thing purchased is ain. They are developing a special arket for whipping cream.

There is probably no better example the United States showing the lue of a county Guernsey club than demonstrated in this county. In eir cow testing association last year the average production of 350 cows was 9,536 pounds milk and 366.9 pounds fat. The records show that the average cost per pound of butter-fat, exclusive of labor, was 30 cents. As an indication of the efficiency developed in the Guernsey herds of the association, the records show that the average returns per cow of the Guernsey herds in the association, exclusive of labor, was $89.

Oregon. E. L. WESTOVER.

The Manger Knot
excellent for tying a halter to a post—just one of the dozens of knots, hitches, and splices fully described in the new H. & A. Booklet, "More Jobs From the Same Rope." *(See coupon below)*



• • Buy good rope • •
—*and you'll need less new rope*

Tying and untying cattle, hoisting, hauling—these little jobs, repeated day-in, day-out, in all kinds of weather, prove the real quality of your rope.

Such jobs wear out an ordinary rope too soon, making it an expensive "economy." But a really *good*, dependable rope saves you many dollars in the end.

Here's a sure way to know good rope, *before you buy it:*

Untwist the strands. If you see a thin blue thread marker, the "Blue Heart," running in the center between the strands, you may

be sure of the following facts about the rope:

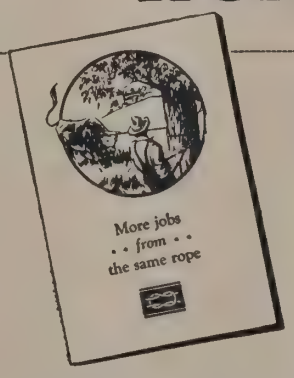
What the "Blue Heart" signifies

The "Blue Heart" marker means that the rope is genuine H. & A. "Blue Heart" Manila Rope, spun from high grade, pure, selected manila fibre by rope makers with over half a century's accumulated experience.

It also means that in any size, on any job, the rope will wear longer and deliver without fail the strength you have a right to expect. For the selected fibres of H. & A. "Blue Heart" are drawn, spun, laid, and properly lubricated so as to insure the smooth working of every fibre, yarn, and strand.

Before you buy rope, untwist the strands and look for the "Blue Heart"—our registered trade mark. It assures you of dependable rope value not only on the first purchase, but whenever you need more of the same kind.

The Hooven & Allison Company
"Spinners of fine cordage since 1869"
Xenia, Ohio



H.&A."Star Brand" Binder Twine
evenly spun from the best fibres — has full yardage, ample strength for binding purposes, and is treated against destruction by insects.

H&A

For sisal rope
For other jobs where high-grade sisal rope is wanted, use H. & A. "Red Heart" Sisal Rope—spun from selected sisal fibre by the same skilled rope makers.

Champion Grade Holstein at Nationa

GLENN HAYES, ILLINOIS

LITERALLY taken right out of a working herd, without an hour's fitting, the best four cows out of an average carload of grade Holstein milkers costing $125 per head in New York State four years ago, won first, third, fifth, and sixth in the class for "cows with cow test association production records of 300 pounds butterfat or over" at the recent National Dairy Show. The winning cow was later made champion grade Holstein of the show.

Four years ago the winning cows were nameless, unknown, so-called ordinary milkers on a farm near Sherburne, New York. As part of a carload of grade milkers, they arrived at the Larro Research Farm, Michigan, in poor condition. Since 1922 these cows have been used in experimental work. A 20% protein grain ration, good hay and silage—good, safe, sane feeds almost any farmer can obtain—worked wonders with practically every individual.

Since reaching their present home, practically every pound of their grain ration has been weighed and fed according to the production of each individual cow. Numerous timing experiments, under practical conditions while the cows have been at their present home, showed it required only 11 seconds more per cow for each of the two feedings to weigh out the exact feed than it took where the feed was not weighed. To weigh and record the milk from each cow was found to take only 20 seconds more per milking than was required to merely dump the milk over the cooler, or 40 seconds for the two milkings. In all, no more than 62 seconds, or about a minute, were required to have a complete record of each cow's feed consumption and rather drives home facts that a dairymen have known for ages bu which need statistics and proof in th shape of actual performance to bac them up.

In commenting on the cows tha won four out of the first six place Prof. H. H. Kildee, Iowa State Co lege, who judged the grades said, i substance: "The Larro Researc Farm cows are good grade anima but they won on their condition rathe than on their conformation, and de feated cows equally as good, if no better in type, because of their mo yellow hides, pliable, silky udders an general all around prime milky cond tion."

milk production. And the minute day made the milking pay—for a cer tainty!

The development of the champio grade cow is particularly interestin because it shows what can be don with an average good grade, fed in telligently and managed according t the sound advice given in the column of the best farm papers and scores o books. When the cow, Larrobelle later to be made champion Holstei grade at the National, arrived at th farm, she was in poor condition an tipped the beam at 985 pounds. I four years she produced 47,572. pounds milk, an average of 11,893 lb per year. At the show she weighed few pounds less than 1,200 lbs. He best lactation period was 17,82 pounds in 360 days. Last year she pro duced 13,032 pounds milk, 481 pound butterfat in the Wayne Co. C. T. A The four winners averaged 11,18 pounds milk, 386 pounds fat in the C T. A. year recently ended. So muc for statistics—every National Dair Show teaches scores of lessons, o

Left to right: W. E. Skinner, manager, and Chas. Hill, secretary, National Dairy Exposition; Larrobelle, champion grade Holstein cow, with James E. Larrowe, her owner, and Professor H. H. Kildee, judge.

The Draft of Wagons

The agricultural engineering section of the Missouri Station conducted tests to determine the influence of various surfaces, including field and road, on the power required to pull wagons over these surfaces. Likewise the diameter of wheel and width of tire were checked up for their influence on power requirements.

Averaging all tests with various kinds of equipment, as to height of wheels and width of tires, the draft on the different roadways reckoned in pounds per ton load on level ground was found to be as follows:

Cornstalk field 445.5; bluegrass sod 185.5; clay road (muddy) 232.6; clay road (spongy) 199.4; clay road (dry and firm) 78.7; gravel road (dry, well packed) 62.1; cinder road (dry, well packed) 109.3; macadam (dry, packed) 64.3; burned clay ballast 113.1; concrete (good condition) 50.3; brick (new) 49; brick (worn) 57.8.

From the tests in cultivated lan it was found that a saving of 46½ lbs. in draft per ton load was accomplished by increasing the height of wheels from 38 inches to 42 inches while an average reduction of 118½ lbs. draft was obtained by using inch tires in place of 1½ inch tires.

On hard surface roads neither th height of wheel nor the width of tir had any marked effect on the draf showing 4½ lbs. advantage for 4 inch wheels and 7.8 lbs. advantag for 4 inch tires.

The draft of a wagon is made u of axle friction, grade, and rollin friction. The rolling friction is in fluenced by type of roadway, loa radius of the wheel, and under fiel conditions, width of tire.

Farm Relief in Congress

THE following is a brief summary of the bill introduced by Senator McNary, a practically identical bill being introduced in the House by Mr. Haugen:

A—The Federal Farm Board shall consist of the Secretary of Agriculture and one member from each of the twelve Federal Land Bank districts. Appointed by the President (with the approval of the Senate) from lists of eligibles submitted by a nominating committee for each district.

B—The nominating committee is to consist of five members, one selected by the Secretary of Agriculture and four at a meeting of representatives of all farm organizations in the district. These members hold office for two years, receive $20 per diem, and their sole duty is to submit the names of three men from the district to the President from which he is to select one for the Board.

C—Members of the Board are to serve six years, will receive $10,000 a year, and are not to actively engage in any business. They are to have power to carry into effect the provisions of this bill, to engage necessary help, and to have general management of its affairs.

Basic Agricultural Commodities

A—These are defined to be wheat, corn, cotton, rice, and hogs; also food products of these, except cotton.

B—An advisory council of seven members for each basic commodity is to be selected by the Board, to be chosen from lists submitted by co-operative and farm organizations representative of the commodity. Members serve one year, to advise with the Board concerning marketing, and to receive $20 per diem and expenses.

Control of Surplus

A—When the Board finds a surplus of a basic commodity above domestic needs or above requirements for orderly marketing, subject to approval of the Advisory Council and a substantial number of co-operative associations, then it shall publish its findings and give date when it will commence to operate in this commodity.

B—Decision to commence or cease operation in a commodity to be decided by a majority vote of the Board, but it shall not do so unless all members of the Board representing the Federal Land Bank districts which produced 50 per cent of such commodity during the preceding year vote in favor thereof.

C—Board to buy and sell through co-operatives handling the commodity or through persons processing the commodity. Losses, costs, and charges arising from purchase, sale, or storage to be paid from the Stabilization Fund, and profits to be paid into this fund. Board may also advance money from this fund to co-operatives for financing purchases, sales, and storage.

Equalization Fee

A—Prior to starting operations in a basic commodity the Board is to estimate the probable advances, losses, etc., and to publish these on the basis of the amount for each unit of the commodity. This is to be known as the Equalization Fee. The Board is also to specify the period for which this fee shall remain in effect and how it is to be collected.

B—The Equalization Fee is to be paid on transporting, processing, or sale of the commodity, as the Board may determine. Any person engaged in transporting, processing, or sale may be required:

1. To file a return of all business done.
2. To collect the Equalization Fee.
3. In the case of cotton to issue a serial receipt to seller which shall be evidence of his right to participate in the surplus, if any, of the equalization fund for this commodity.
4. Failure to collect or account for Equalization Fee subjects the person to the amount due plus a penalty of one-half this amount.

Stabilization Fund

A—A Stabilization Fund shall be established for each basic commodity. This is to be composed of advances from the Revolving Fund supplied by the government, as also of the Equalization Fees collected and the profits, if any, on the commodity.

B—Disbursements from each stabilization fund shall be made for such charges for general operation costs of the entire system as the Board may determine, for all operations relating to such basic commodity, and for repayments to the Revolving Fund appropriated by Congress. When the receipts from equalization fees on cotton are in excess of the cost of operation, the Board may retire the serial receipts given sellers, such payments to be made in the same ratio as the profits are to the total crop handled.

Revolving Fund

Congress appropriates $250,000,000 as a Revolving Fund to be administered by the Board in establishing a Stabilization Fund for each commodity. For expenses of administration price to July 1, 1928, there is $500,000 appropriated directly for use of the Board.

The Board is authorized to make loans to co-operatives (whether handling basic commodities or not) to assist them in handling the surplus of any agricultural product, and to assist them in the purchase of storage or processing plants, such loans to bear 4 per cent interest and not to aggregate more than $25,000,000.

Senator McNary Discusses His Bill

In explaining his bill on farm relief, Senator McNary stated that it is a new bill but retains many of the essentials of the measure introduced at the last session of Congress. A separate stabilization fund is provided for each of the five basic commodities, cotton, wheat, corn, rice, and hogs. In the old bill the equalization fee was imposed on all products named in the bill and in the new draft the fee is imposed upon each marketable unit of such commodities. This carries out the idea that we are dealing with the commodity rather than individual farmers. The fee will be collected at the most convenient point along the route of the commodity to market. The Board is given authority to collect it on transportation, or upon the first sale, or at the processing or milling point.

The Federal Farm Board will not buy or sell anything on its own account. It merely has authority to use the appropriation in purchases in anticipation of the collection of equalization fees which will repay to the government all loans that it has made.

All reference to price levels and price standards are omitted from the present bill.

The Haugen Bill

A companion measure to the McNary Bill was later introduced in the House by Representative Haugen, Chairman of the Agricultural Committee in the House. On Decem-

I Learned this Priceless HARNESS SECRET From a Pail Handle

John C. Nichols President

$5 Down after 30 Days' Trial; Balance Easy Monthly Payments

This Strap was Short-Snubbed

To prove my claim that Wear-More is the strongest harness made, let me send you any style you select for 30 days' free service on your own team. Test it in every way. I take your word for it if not then convinced. Simply return it at my expense. Write today for big, free book, with new reduced prices. See how I've done away with rubbing and see-sawing between leather and metal. Doubled wear right here! Learn how short-snubbing of leather under buckle edge or around narrow metal units costs you money in breakdowns and repairs. See how I overcome this—how I learned this priceless harness secret from a pail handle. I believe you owe it to your pocketbook to investigate, at once, this marvelous advance in harness-making and harness value.

See above how oil is squeezed out, fibers packed and strap cracked. Like carrying pail with wire handle. None of th's in Wear-More!

ber 21 Mr. Haugen said his bill had the approval of the various farm groups and that it and various other farm relief measures will be considered by the House Committee on January 6. He expects only short hearings on his bill as the subject has been fully discussed at previous times.

The Haugen Bill is identical with the Senator McNary's Bill except in two particulars which are not important as applied to the general scope and operation of the plan for the control of surplus. In explanation of his bill, Mr. Haugen says, in part:

"This measure does not separate responsibility from control in disposing of surpluses and in developing cooperative marketing. * * * The Bill provides for 100 per cent farmer control. The Federal Farm Board will be truly reflective of the farmers' thought; not only in its first creation but throughout the years to come. * * * This bill boils down to the essence of the entire proposition and provides the necessary working machinery to enable the farmers themselves in their organization, without subsidy, to dispose of their own crops when produced in surplus amounts."

The Cotton Bill

A new farm relief measure along the lines of the McNary Bill in the Senate, has recently been introduced in the House by Representative Fulmer of South Carolina. It differs from the McNary Bill in the fact that $100,000,000 is appropriated to be held in reserve for advances in the stabilization of cotton. It provides for an equalization fee of not more than $2.00 a bale on cotton to be collected from all producers of cotton, but this equalization fee will not be collected until two years after the passage of the bill.

In introducing his bill which is known as the McNary—Purnell—Fulmer Bill, Mr. Fulmer states that he believes it will bring about a more orderly marketing of the major farm commodities and thereby a fair and stabilized price. He states that as a Democrat he believed in tariff revision, yet he felt that this could not be accomplished at this time and that his bill would give to farmers something of the same protection that industry now receives. He said: "The passage of this bill is the one way to force tariff reduction by having a farmer-minded board that will look into tariff and freight rates that will give to the people and to Congress the facts as they are toward agriculture."

In discussing the operation of his plan, Mr. Fulmer said, in part: "When we have a surplus like this year, we would buy, in competition to the trade, whatever number of bales that it would take to bring about a fair price, a healthy demand, and orderly marketing. Under this machinery we would or could cut out speculation by taking off or feeding into the market in such manner so as to maintain a fair and stabilized price, knowing that to allow the price to be bid too high would do as much damage in the way of increasing production and the retarding of consumption as it would to allow the surplus cotton to be forced on the market, as it is now, which causes the price to average below the cost of production.

"Our bill will permit co-operative associations or other agencies in contract with the Federal Farm Board to go on the open market and buy at full market price, giving the seller a receipt thereof so that he may participate in any profits made under the operation, and take any and all cotton off the market until a fair price and orderly marketing is established.

"The bill carries $250,000,000. Of this, $100,000,000 is for the handling of cotton and $150,000,000 for the other commodities."

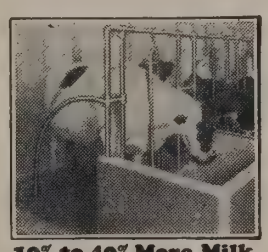
Comments by Opponents

In discussing Mr. Fulmer's bill, Representative Haugen of Iowa asserted that it was his understanding that the cotton people were joining with the others in the demand for farm relief. The committee is against any single subsidy feature and proposed to treat all branches of agriculture alike.

Representative Aswell of Louisiana expressed himself as unalterably opposed to the bill. He said it would "enslave agriculture and reduce it to peasantry." He argues that the measure is unconstitutional and would destroy the cotton co-operatives, because the Federal Board would take over their functions and thus discourage membership. He further said, "If it should become operative, it would destroy any member of Congress who supported it, because of the feeling that would be aroused when the federal tax gatherer appeared in the cotton sections to demand his pound of flesh."

"All-through Dad-it only takes half the time and half the work now!"

Mail the Coupon below to us today! Let us show you how you too can reduce the drudgery of your barn work—take the burden and ache off your shoulders and arms—banish the backstrain—save hours of time every day in the year—*and make an increased cash profit in more milk from your cows.* Thousands of farmers are doing this—why not you?



It costs you nothing to get the facts. Does not place you under any obligation whatever. Isn't it worth the minute it takes to fill out the coupon—to learn for yourself what Louden Barn Equipment is doing for other farmers? Just check the information you want. The coupon will bring it to you—conditions and results that will show you how easily and reasonably you can solve *your* problems—whatever the size of your herd, barn or farm.

We will send you the evidence. Louden up-to-the-minute improvements quickly pay for themselves in greater milk production from your herd, in protecting the health of your cows, in fewer veterinary bills. These improvements *keep on* adding a profit year after year for a lifetime. These facts are from the records of Louden Equipment owners—farmers like yourself. Read them over. Judge for yourself.

WM. LOUDEN

Pioneer inventor of labor-saving barn equipment. Invented first hay carrier in 1867. Holds first U.S. patent on Manure Carrier. Displayed first all-steel cow stall and stanchion. Over 200 other labor-saving patents. Still on the job daily.

10% to 40% More Milk

Louden Water Bowls pay for themselves and show a profit before the first winter is over. Lengthen lactation period. Save time and the falling off in production that results from turning cows out to water in zero weather. Prevent spread of disease from cow to cow through water. Send for booklet and prices.

One Trip—Five Wheelbarrow Loads

Louden Manure Carrier with easy hoist and big, heavily built tub takes drudgery out of barn cleaning. Takes five wheelbarrow loads in one trip—so easy a 12-year old boy can use it. Biggest time and labor saver you can put in your barn. Easily installed in old or new barns. Write for folder.

LOUDEN

LABOR-SAVING BARN EQUIPMENT

is admittedly one of the greatest factors in labor saving and dairy profits today. Your cows profit in health as you profit in money. Take the Louden Steel Stalls and Stanchions. Real pasture comfort in the barn. Cows quickly stanchioned and released. All the modern advantages over old, discouraging, unsanitary, wooden stalls. Louden Water Bowls bring up milk production right away. End the job of turning the cows out to water. Louden Manure Carrier with worm gear hoist, durable track, heavy spot-welded tub, takes out five wheelbarrow loads at a trip. An easy push.

Here's What Users Say:

"I have a boy 11 years old and he cleans the barn while I milk 12 cows."—John Rissler, Durand, Wis.

"I am using my litter carrier the fourth winter. A time saver. Labor cut three-fourths."—A. E. Dietzman, Rib Lake, Wis.

"The water bowls certainly beat driving cows out in cold, snowy weather. I wouldn't be without them for twice what they cost."—E. B. Irvin, White Hall, Md.

"We feel that our barn work has easily been cut in two by Louden equipment."—Fred Peterson, Irma, Wis.

"With Louden Equipment I know from personal experience the care of a herd is made profitable and a pleasure instead of drudgery."—P. Winkelman, Granville, N. D.

"Louden Stanchions are just right—simple, durable. We have two barns Louden equipped."—H. G. Willy, Holman, Wis.

Coupon Brings You Full Information Covering—

Steel Stalls and Stanchions, Manure Carriers, Feed Carriers and Trucks, Water Bowls, Steel Pens, Manger Divisions, Bull Staff, Cupolas, Ventilating Systems, Hog House Equipment, Hay Unloading Tools, Power Hoists, Barn and Garage Door Hangers—in fact "Everything for the Barn." Use the coupon.

We will gladly explain, if desired, how this better equipment can be paid for out of income instead of capital.

Get This Help in Barn Planning

Our Barn Plan Department will gladly help you plan in building or remodeling a barn. Help you get the best arranged, most convenient barn for the money you spend. A barn that will save thousands of needless steps every year; one that saves lumber waste, with the best type of roof for your needs and with large, roomy mow capacity.

Over 15,000 barns have been built from the plans freely given by Louden Barn Experts. Just tell us the number and kind of stock you have to house and when you intend to begin building. We will send free of obligation blue-print plan suggestions to fit your needs. Write today.

BOOSTS HIS EARNINGS $25 A WEEK WITH THE FULLER

AUXILIARY TRANSMISSION

FOR FORD TRUCKS

"I averaged $1.00 to $1.25 a load and with my FULLER Auxiliary Transmission I can haul at least four more loads of gravel a day than can drivers whose trucks are not equipped with FULLERS," says Steve Collins, 1632 Lincoln Avenue, Kalamazoo, Michigan.

"The FULLER helps me boost my earnings $20 to $25 a week. I can take bigger loads than any other Ford Truck in the pit, and outpull and outrun them all."

Mr. Collins' truck has a high speed worm gear, and he makes 25 to 30 miles an hour on the level loaded with two tons of sand. With the FULLER he breezes up ordinary hills in intermediate, while others labor along in low. His FULLER increases his truck's pulling ability 80%. In the gravel pit he pulls through sand hub-deep without stalling

The FULLER has just as much money-making value in farm work, as in the construction field. Its flexibility and increased pulling ability will help you carry more loads and do more work every day. Yet it is so simply made that it costs only $60.00, plus cost of installation.

Ask your Ford Dealer about the FULLER Auxiliary Transmission

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative. destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Votes for the Jersey

HOARD'S DAIRYMAN:—In your last issue I noticed an article by A. G. Ingham in reply to "Butterfat" which certainly is a fine bit of sarcasm. The best way to settle such a question is by comparing records of different leaders of the two breeds. I am glad to offer a few official records of Jerseys and if he will supply the Guernsey records we will have a real ground for comparison.

Our first record is that of Sophie 19th of Hood Farm. At the age of nineteen years she has eleven records totaling 7,545 lbs. fat; highest year's record, 999.1 lbs. fat. Her son, Pogis 99th of Hood Farm, has sired 104 daughters who had official records up to November, 1925. These daughters at an average age of three years, eleven months produced an average of 580.46 lbs. fat. Fauvic's Prince had 33 daughters with official records. These daughters at an average age of two years, eleven months averaged 587.26 lbs. fat. We have included the record of every tested daughter of these two bulls, not the high ones only.

Vive La France in her six first lactations produced 5,332 lbs. fat and seven living calves. For two consecutive years her fat production exceeded her live weight. Her highest year's record is 1039.29 lbs. fat. The year before she produced 1031.64 lbs. fat.

Darling's Jolly Lassie, as a junior four-year-old, produced 1141.28 lbs. fat in one year.

Namrow, at sixteen years of age, started test and produced 16,008 lbs. milk, 774.9 lbs. fat.

Financial King's Interest at 24 years of age, had had 20 daughters and one son.

Of course, Guernseys have exceeded some of these records, but not all by any means; in fact, we believe only a small part of them.

The grand average of all Guernseys is good, but no better than that of Jerseys. This being true, and since Jerseys mature younger, produce and reproduce profitably just as long or longer, and since the original investment is less, we see no reason for doubting that Jerseys are more profitable.

So far as health is concerned I shall quote the U. S. Dept. of Agriculture on tuberculosis, one of the worst diseases: "Holsteins tested, 381,998; reactors, 29,971; per cent, 7.85. Ayrshires tested, 15,972; reactors, 663; per cent, 4.15. Guernseys tested, 82,824; reactors, 3,444; per cent, 4.16. Jerseys tested, 33,889; reactors, 7,438; per cent, 2.37. All other breeds tested, 407,774; reactors, 14,858; per cent, 3.64.—Report of 1922 or 1923, copied by "The Ohio Jersey," 1923.

The reason Jerseys sell more reasonable than Guernseys is because they are much more numerous and evenly distributed. The main reason for seeing few Jersey ads in the Dairyman is that every leading breeder and a very large part of all Jersey fans take the breed paper, "The Jersey Bulletin." I counted the ads in an old number (Nov. 11, 1925) and found 104 offering Jerseys for sale—not so bad.

This is getting too long to add a few records of comparison on profitable production so will refer you to "Types and Breeds" by Plumb. If we can get comparative tests by disinterested persons we shall go far toward solving this problem but until then the two breeds seem to be the leaders in net profit produced and we vote the Jersey first by a good margin.

Michigan. W. E. MAIN.

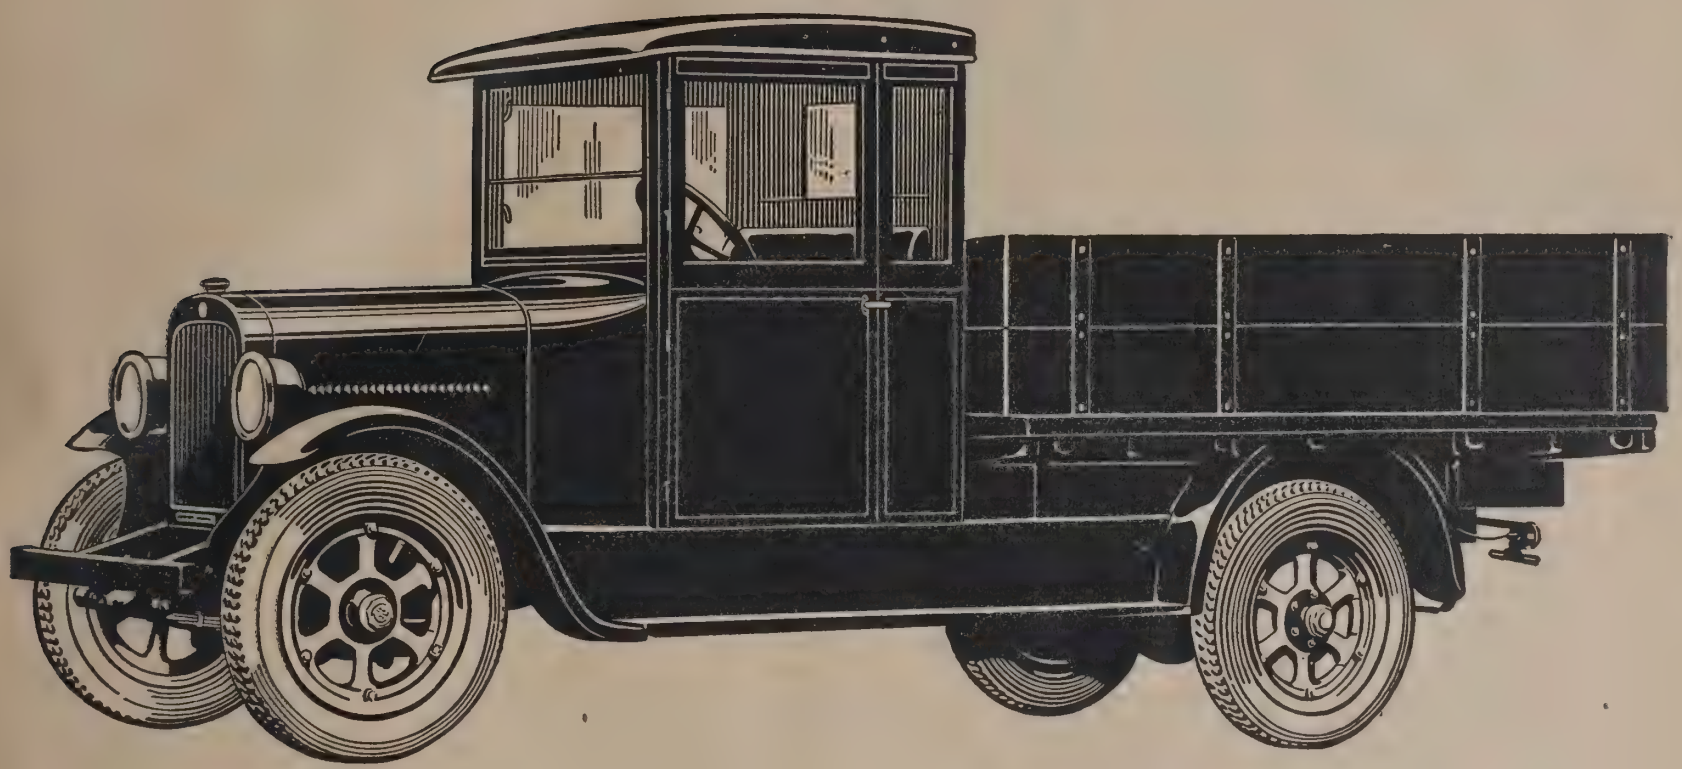
Favors Colorado

HOARD'S DAIRYMAN:—Would just like to say a few words in the way of friendly advice to the readers of the Dairyman who are thinking of moving, and especially those going to the extreme South.

There are many things to take into consideration when one from the North thinks of going South. I know from observation and personal experience. I was reared in the South Coast country and came to Moffat County, Colorado, in December, 1917, and lived here ever since except one winter when we went back for a visit and vacation. All went well till about the first of March when the sun began to get very warm and we were glad to head back to cool Colorado.

Now it seems that every one is trying to get everybody he can to come to his part. That's fine if they will stay, but I am afraid too many times people are not well enough acquainted with all conditions before moving to a new place, and especially when making long moves. I am sure Mr. Leach and Mr. Ramsden are both doing fine and, no doubt, the change in climate did not affect them for the worse; but, on the other hand, I could enumerate several cases where families have suffered the loss of some of their dear ones from making so great a change.

Now, good people, I am no real estate salesman—just simply a farmer and am not offering you anything for sale. But as some of the other writers have told you the good things about their counties (which I am sure are true) I just want to call your attention to Moffat County, Colorado, and all Northwestern Colorado. We have an empire of undeveloped and slightly developed land of the prairie, rolling and mountain lands, either irrigated or, what we call, dry farms, where you men from the northern and central states would think you had gone South when you compared this climate with that.



We don't grow grapefruits or bananas, but we can grow the finest of small grain, potatoes, head lettuce, cabbage, and almost all kinds of vegetables of finest quality. Corn has produced as much as 50 bushels per acre in the lower lands. My oats this year went 40 bushels and winter wheat 20 bushels per acre. I have grown as much as 10 tons of marketable potatoes per acre. This is a fine country to grow high class field seeds.

If any of you are interested in this section, I would be glad to assist you as much as I can, as we need more good farmers, more good cows, horses, and sheep; in short, everything to develop this big new country. I might say that good land can be bought for from $10 to $50 per acre according to improvements and distance from town.

Give us more good neighbors and farm papers like Hoard's Dairyman and we will show the world a thing or two. So here's three cheers for the Dairyman. Good luck and a Merry Christmas to it and all its many readers.

Colorado, WILL H. ROGERS.

GRAHAM BROTHERS TRUCKS

Complete—Ready to Work

When your work requires a truck—or additional trucks—the need is immediate.

You can get the Graham Brothers Truck you want—without long delay. They are built in the right sizes and with the correct body styles to fit your needs.

And your dealings throughout the long life of the truck are with one concern—the Dodge Brothers dealer. He will be right there year after year to sell and to serve.

Only great mass production enables Graham Brothers to build for you such sturdy, dependable trucks at such low prices.

What do *you* think of the farm future?

"Am familiar with other farming localities," writes Ed McDonnell, of Lewistown, Montana, "and know of no place where, with the same investment, you can get the returns you can here, if a practical farmer."

Mr. McDonnell came to Montana with only $200 in capital. Today he owns and operates a fine diversified farm in the heart of Judith Basin, near Lewistown, Montana. His average crop of wheat is 25 bushels to the acre; oats, 65 bushels; barley, 40 bushels; alfalfa hay, 3 tons; white potatoes, 150 bushels.

His stock and poultry production is equally successful. Hogs have never suffered from disease; his small flock of sheep increased 136% in 1925. He keeps an average of 200 head of cattle; raises chickens, turkeys; milks 7 cows.

"I consider Montana's climate better than that of Iowa, Wisconsin or Minnesota," says Mr. McDonnell. "The opportunities here are excellent for practical farmers and stockmen."

TO PUGET SOUND
THE CHICAGO MILWAUKEE AND ST. PAUL RAILWAY
ELECTRIFIED

Are your children satisfied to remain on the old farm when there are so many opportunities in a growing country with its development ahead of it?

Why don't you come to Montana or western North or South Dakota, a country that offers marvelous opportunities to the active farmer? The "land-boomers" have passed, but they left wonderful farmland behind them. In 1924 the farmers who held on harvested 50,000,000 bushels of wheat, liquidating the debts incurred during the depression. The 1925 crop netted even a greater return. Dairying, cattle and hog raising, all forms of diversified farming, are working miracles on the broad plains and green valleys of the Upper Missouri River basin.

You will be astonished at Montana and western North and South Dakota. The climate ...htful and healthful. Min... water-power have ...wealth to many ...untry. Young ...splendidly equipped with hospitals, schools, churches, stores and theatres, are centers for inspiring community activities. Neighbors are friendly. Great trunk railways keep you in close touch with markets. Roads are good. Fine land can now be purchased at reasonable prices on easy terms.

This is the land to grow in! A farm here means a free open life that your family will love on land that will show you a profit each year. Your children may add their farms to yours; and as the country grows the value of your fields will grow with it. *Those who buy and settle in this country today will be the well-to-do leaders of tomorrow!*

Harry F. Hunter, 24-B
Agricultural Agent, C. M. & St. Paul Ry.

News from Washington, D. C.

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, Dec. 27—The oleomargarine bill introduced in the House by Congressman Tincher of Kansas is regarded as a dangerous piece of legislation by all who have seen it except the advocates of more oleomargarine. There are no indications that it will receive any official consideration at this time, as before getting consideration it will be the subject of hearings before the House Agricultural Committee, and this committee will be very busy for some time after January 1st with hearings on the general agricultural bills. The bill is regarded generally as a clever effort of the oleomargarine interests to get more favorable legislation through an apparently harmless looking bill introduced by a congressman who has a good record as a friend of agricultural legislation. Congressman Tincher has represented a big wheat growing district in Kansas. He retires from Congress with this term.

The Agricultural Appropriation Bill passed the House of Representatives on Dec. 22, two days before the House recessed for the holidays. An analysis of the bill shows that the Bureau of Dairy Industry has not been treated very well, all of the increase for this work having been cut out by the House Committee.

A farm relief legislation is now in position to have early and a large amount of consideration the coming two months. Senator McNary has introduced the bill in the Senate which will have the most of the attention, with Congressman Gilbert N. Haugen introducing the same bill in the House. Each one is the chairman of the committee which will have the task of considering the bill and holding hearings, and this assures that this particular bill will have the right of way.

The bill is very similar to the one proposed last year. The equalization fee plan for providing the money required is the same as a year ago, except that it is especially provided that this fee is to be collected from a "marketed unit" of the commodity, so this will relieve all payments from farmer producers. As to wheat, for instance, the fee will be collected at the elevator or the mill.

The operation of the bill is limited to five commodities: cotton, corn, wheat, rice, and hogs.

The bill if enacted will provide for a board to be named by the President from names submitted by farmers' organizations, which board is to operate as needed to keep surplus crops from reaching the domestic markets to depress prices. This is the purpose of the bill and the money to do this is provided first as a loan fund of $250,000,000 from the treasury such as is used up to be repaid from the equalization fee as indicated.

There is more general agreement among the agricultural leaders than has been found in previous years. The only difference seems to be from a few representatives of cotton producing districts who assert that the cotton interests are in so serious a plight now that they can not pay the equalization fee, and hence they ask to have this fee as to cotton deferred for two years.

All mention of dairy products is omitted from the bill as it now stands.

The Lenroot—Taber bill, after a two-day hearing in the Senate Committee on Agriculture, reached a point where the opponents asked for an opportunity to submit amendments which, if accepted, would result in the withdrawal of their opposition. In a conference then held an amendment was decided on which in substance excepts a twenty-mile strip in Canada from the operation of the bill provided that the milk or cream produced in this twenty miles of the station where it is sent is sent to such station and there either pasteurized for sale as fluid milk or cream, or used in making condensed or evaporated milk or cream. Adopting this amendment leaves the full provisions as to barn score, bacteria count, cooling, and sanitary requirements effective as to any milk from outside this 20-mile zone which is to be shipped into this country. Senator Lenroot and Congressman Taber agreed to this change, and the Senate Committee promptly approved and reported the bill. It now goes to the Senate calendar and will be passed at an early date unless no unforseen further opposition arises. This change will make it necessary to send the bill to conference as the bill without this amendment passed the House.

Notices have been sent out of the American Dairy Federation office here this week stating that President Bailey has called a meeting of the Executive Committee and of the "Coordinating Committee" which he named at the annual meeting, the joint session to be held at the Sherman Hotel, Chicago, January 10th.

Breeding and Improvement of Farm Animals

Students of animal breeding, whether in the class room or on the farm, will find some interesting and helpful reading in a new book, "Breeding and Improvement of Farm Animals," by Victor A. Rice of the Massachusetts Agricultural College.

The real objective of the author is that of effecting a more intelligent use of the proven facts in this fascinating field of human endeavor.

The practice of animal breeding is many centuries old but a scientific understanding of the behavior of germ plasm through which an individual inherits the factors that control its form and function is comparatively young.

The author seeks to make plain the possibilities and limitations in animal breeding. To do this he has of necessity included a discussion of the more important findings of scientific investigation particularly as related to the "how" and "why" of inheritance. These chapters will not be easy reading for those who have not had preliminary training in cytology, embryology, and genetics.

The major portion of the book, however, is devoted to the practice of animal breeding. Subjects of particular interest to dairymen are: Grading and Crossing, Inbreeding, Selection, Breed Analysis, and Sterility. The chapter on Breed Analysis is especially good in that it is devoted almost entirely to data on the dairy breeds of cattle.

Copies of this book may be secured through Hoard's Dairyman Book Department on receipt of the regular price, $3.50.

Caring for Cream in Cold Weather

HOARD'S DAIRYMAN:—During the winter months it is no longer a problem to keep cream cool and sweet in order to obtain a better price. It is a problem, however, to keep the cream from freezing.

When cream freezes, the solidification starts from the outside and moves gradually inward. The water in the cream is the first to freeze and the solids are driven toward the center. When the creamery or cream station operator samples this cream, he doesn't have the time to melt it and bring the frozen material back into solution, but instead the cream is stirred and the frozen part is broken into small particles. The icy particles that go into the sample jar will nearly always result in a lower test.

In case the cream producers belong to a co-operative creamery, they owe it to themselves and to their organization to deliver cream that can be handled in the shortest time and can be made in a better finished product. This cannot be done by delivering frozen cream. It requires more time for the creamery operator to stir frozen cream and often cans have to be heated before they can be emptied. Freezing also affects the properties of the butterfat so that the body of the butter is mealy which lowers its market value.

The Dairy Department of Iowa State College recommends the use of a simple device which can be made at a fairly low cost and will not only serve as a means of keeping cream from freezing, but it can be used during the remainder of the year to keep cream sweet.

A good oak barrel is sawed off one-third of the way down. A large box is constructed to set the barrel into, allowing at least eight inches between any side of the barrel and the box. The box is filled with dry sawdust, which is to be kept dry at all times. If this device is not placed in a building, it must be covered to keep out the rain because if the sawdust gets wet it will not act as a good insulator.

This device is placed between the well and the stock tank and all the water going from the pump is piped to the top of the barrel and down to the bottom. The outlet is at the top so that the oldest water in the barrel will be carried off.

This barrel will hold two five-gallon shotgun cans. The cream is placed in the water immediately after separation. This should be done invariably the year around, because it will cool much faster in the water and souring will be delayed much longer. The sawdust acts as an insulator, and the water in the barrel will freeze only slightly on the surface, and the cream will be kept from freezing in the coldest of weather.

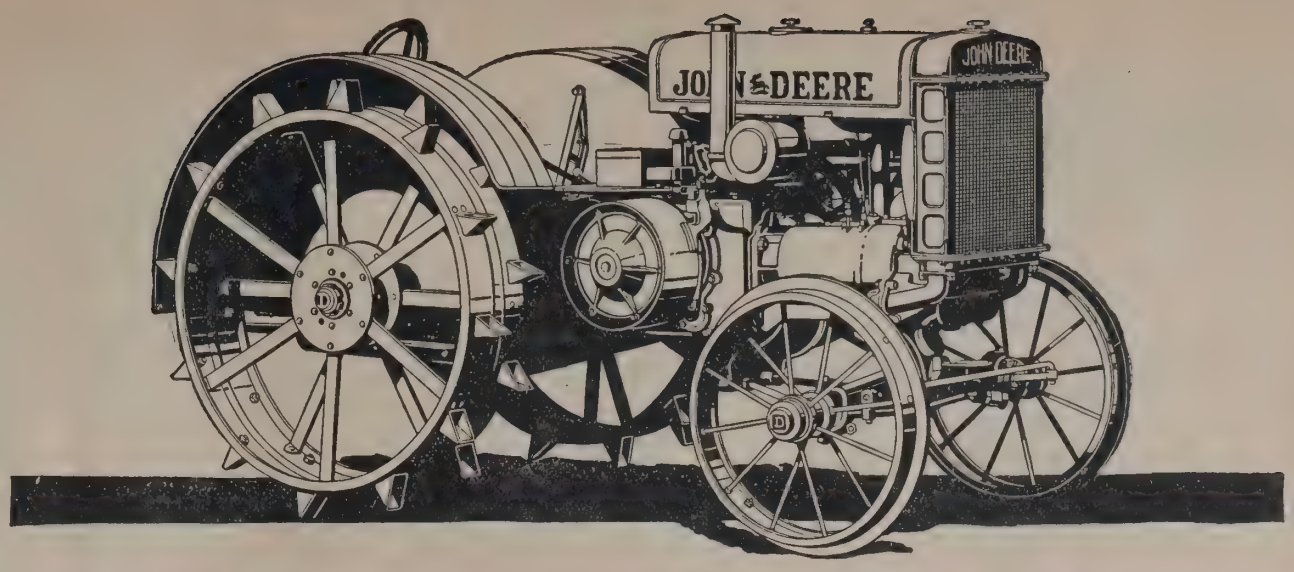
Iowa. EUGENE KELLEY.

Foreign Legume Seed to be Colored Red, Green, and Violet

According to recent federal seed regulations, foreign legume seeds will be dyed different colors so they can be readily recognized. The following includes the chief provisions of the act:

Alfalfa seed and red clover seed of known foreign origin other than Canada, and not formally determined by the Secretary of Agriculture to be unadapted for general use in the United States, will be colored approximately 1% green.

Imported alfalfa seed and imported red clover seed of unknown origin, or formally determined by the Secretary of Agriculture to be unadapted to general use in the United States, will be colored about 10% red.



Alfalfa seed and red clover seed from Canada will be colored approximately 1% violet.

Carver County Holstein Breeders Meet

On December 10, the annual meeting of the newly organized Carver County Holstein Breeders' Association was held at Waconia and in spite of the big snow storm on the preceding day, thirty-five members were present.

The officers elected for the coming year are as follows: F. C. Oelfke, president; J. A. Anderson, vice-president; R. J. Kratzke, secretary and treasurer.

Many plans were made for a large number of projects for the coming year and a $25 silver loving cup was donated for the champion Holstein calf club calf to be shown at the county fair at Waconia.—Minnesota Holstein Breeders' Association.

Like the Horse that's an Easy Keeper

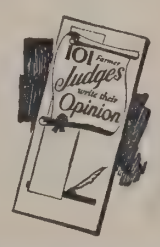
You know the horse that's referred to as an easy keeper—the one that keeps in better condition on less feed and does as much or more work than heavier horses—the horse you can always depend upon.

The John Deere 15-27 is the Easy Keeper in the Tractor Field

It produces more power with less weight.
It does more work with less fuel and oil.
It gives many more years of satisfactory service at much lower cost for upkeep.
It produces its great power to do your work as you want it done at costs unbelievably low.

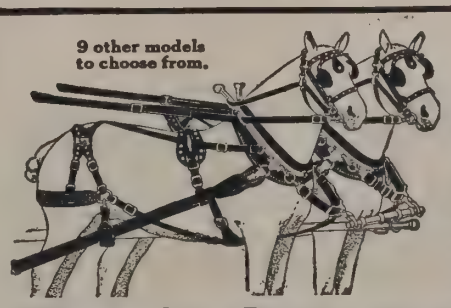
Its great power, combined with light weight; its extreme simplicity; its complete enclosure of working parts; its automatic oiling system; its ease of operation, inspection and adjustments—these are but a few of its qualities that have made the John Deere a sensational success in the hands of its thousands of users.

The John Deere is making hundreds of new power farmers. It is replacing hundreds of outfits that are inefficient and costly to maintain. It is replacing hundreds of tractors that are lacking in power to meet present-day farm needs.



Know what the John Deere will do for you before you buy a tractor. See it at your John Deere dealer's. Ask him for a demonstration.

GET THIS FREE BOOKLET, WRITTEN BY JOHN DEERE TRACTOR OWNERS



Reading this booklet is the next thing to actually talking to 101 users of the John Deere Tractor. It contains 101 letters of the many hundreds that have been received from its enthusiastic users. Many of these owners are farming under conditions similar to your own. Their experience is worth money to you.

You will also get a folder that illustrates the John Deere in its actual colors and that tells all about it.

Write to John Deere. Moline, Illinois, and ask for booklets SW-414.

Dairymen Say It's the *Perfect* Teat Cup

It Milks the Cows Clean

"I have now used the Burrell Milker five years without missing a single milking. Under normal conditions, the Burrell leaves no hand stripping. And if there is a cow in the herd that has sore teats, she can be milked with the machine without trouble. It seems the Burrell Teat Cup is perfect."—*Jake Lahr, Eden Valley, Minn.*

THE strongest claims for the Burrell Milker are made by Burrell users. Thousands of them summarize their experience and express their praise of the Burrell Milker in the single sentence—"*It Milks the Cows Clean*". And one of the reasons why it milks the cows clean is the Burrell *Air-Cushion Teat Cup.*

It Skims the Milk Clean

For many years, the wonderful Link Blades of the Burrell-Simplex Cream Separator have made it famous as the *closest skimmer.* It has a greater capacity for the size of its bowl, for the speed at which it is operated, and for the power required to run it than any other separator. It is simple, light and easy-running. But, above all, *it skims the milk clean*—and that's what you want in a cream separator. Four sizes—350, 500, 750, 1000 lbs.—hand or power driven.

It Cushions Teats with Air

The vacuum suck pulls the air out of the air reservoir, at the top of the cup, over the square shoulder, creating an air cushion which supports the teat. Between sucks air returns to the air reservoir, thus giving complete relief. The Burrell Air-Cushion Teat Cup—made of pure nickel silver—has no dangerous rubber linings. It is simple, sanitary—and *comfortable.*

4 Exclusive Features

(1) The *Automatic Controller,* which regulates the suction to suit exactly each individual cow; (2) the *Air-Cushion Teat Cup,* which supports and compresses the teats by air alone; (3) the *Sanitary Moisture Trap,* which entirely prevents contamination of the milk from the pipe line; (4) the *Positive Relief Pulsator,* which gives complete rest between pulsations and assures natural circulation—these four exclusive features make the Burrell practically a *perfect* milking machine.

Send For Valuable Free Books

Here are two valuable, illustrated books that are free to dairymen. One pictures and describes the Burrell Milker and explains how "*It Milks the Cows Clean*". The other tells about the Burrell-Simplex Cream Separator—all about its simple, sanitary, rugged construction, and how "*It Skims the Milk Clean*". Every dairyman should have both of these interesting, practical, helpful books for handy reference.

Wayside Musings

The Old Passes, the New Appears

JOSEPH S. MORRIS, WISCONSIN

WE pay special attention to the passing of the old year and the appearance of the new year. It is necessary that we shall have some points in time at which we may take stock of our possessions, see wherein we have suffered loss, and wherein we have profited. In our checking up of material profits and losses it may be well to consider to just what degree we have, personally, entered into the matter.

Some people tell me that old year and new year mean nothing to them; that all life is merely a succession of days—some good, some bad, some just "so-so." Of course it is true that life is made neither better nor worse by a calendar unless the calendar happens to be one of those atrocities given away by merchants with no appreciation of the bad influence of the ugly upon the spirit of man.

There can be a very real value in viewing the passing year in reflective mood. If we must mark this year down as a year of reverses, of losses, of failures, then we shall have to be specially thoughtful. No man can enter upon a new period of time and hope to make the most of his opportunities if he enters that new period of time without hope and optimism.

Where are we at? What has life done to us? Has it killed our hope and sent us on our way mere plodders? Have we come to think that there isn't very much that we can do to make things better? Have we been disappointed so often that we are afraid to brighten up and take a new grip upon things for fear that we shall again be disappointed?

It is a difficult thing to ask people to "cheer up!" when they have been disillusioned and have small faith in anything. And yet, it is just that that we must ask them. When a man is disillusioned and hope is all gone, there is nothing that can save him except to reillusion him, to rekindle hope.

The life we must live is not a child's play. It is stern business. We are doomed to see hope shattered and our dream-castles wrecked. And yet the only antidote for the poison of hopelessness is new hope.

You must see the sort of being man is! God-like in his qualities; able to turn inward upon himself and weigh his mistakes and errors; able, after innumerable failures and mistakes, to make of his life a reasonable and worth-while expression.

The man who coddles us in our misery and agrees with us that life is a rotten failure is not our friend but rather our enemy. He is helping us to stay down and if we aren't careful he will put us out permanently.

But someone will say: "How many times shall a man get up and try again?" To that there can be but one answer: "As many times as it may be necessary." A man is never licked until he admits he is.

Hope is the element cast into human life to keep us out of the insane asylums. You can't live life in this world unless you can continue to hope even when hope is well-nigh gone.

There is a great story in the Old Testament in the Bible. Jacob wrestled all through the night with an angel, and as the day was breaking the heavenly messenger wanted to go away but Jacob wouldn't let go until he got the blessing he wanted. God must admire the man who is unconquerable provided, of course, the man has his stubbornness set in the right direction.

There isn't any tonic in the world that is quite so valuable as the tonic of a buoyant, hopeful, optimistic, forward-looking personality. Somehow, under the spell of such a personality, the clouds disappear, the sun comes out, you get your rake and rake up the refuse and wreckage of the past and begin to build again. We need men and women of that type and the more we have the better world we'll build.

I listened to a couple of speeches the other day that did me more good than all the learned discourses of the wise men. It was at a calf club banquet that I heard these speeches. The one was by a lad of sixteen or seventeen. He was businesslike; he knew where he had failed; he laughed off his failure; he was not carried away by his successes; his face was toward the future; he expected to do greater things. The other speech was by a girl member of about the same age. She had a sane, wholesome, healthful view of things. She, too, had been successful but took it all in sweet reasonableness and was looking forward to greater conquests. In the most matter-of-fact way she rejoiced over the boys and girls, together, going in for work that means finer and better dairy stock.

I could not help but conclude that the problems confronting agriculture and dairying in America are not insuperable while we have young people of that type.

The old is always passing and the new is always appearing. Let's take new courage and walk face forward into the future, confident that all will yet be well. There has been a good deal of kicking but perhaps the kicks haven't always been organized and aimed in the right direction.

The world will have as much confidence in you as you have in yourself.

Eulogy of the Horse

Dr. Henry Van Dyke, in his interesting book, "The Other Wiseman," gives this eloquent eulogy of the horse:

"How close, how intimate, is the comradeship between a man and his favorite horse on a long journey. It is a silent, comprehensive friendship, an intercourse beyond the need of words. They drink at the same wayside springs, and sleep under the same guardian stars. They are conscious together of the subduing spell of nightfall and the quickening joy of daybreak. The master shares his evening meal with his hungry companion, and feels the soft, moist lips caressing the palm of his hand as they close over the morsel of bread. In the gray dawn he is roused from his bivouac by the gentle stir of a warm, sweet breath over his sleeping face, and looks up into the eyes of his faithful fellow-traveler, ready and waiting for the toil of the day. Surely, unless he is a pagan and an unbeliever, by whatever name he calls upon his God, he will thank Him for this voiceless sympathy, this dumb affection, and his morning prayer will embrace a double blessing—God bless us both, and keep our feet from falling and our souls from death! And then, through the keen morning air, the swift hoofs beat their spirited music along the road, keeping time to the pulsing of two hearts that are moved with the same eager desire—to conquer space, to devour distance, to attain the goal of the journey."

ISO-VIS

A discovery that will help YOU!

Have you heard about the new motor oil, Iso-Vis? It's an important discovery that will save you money and worry and all kinds of trouble!

Iso-Vis is altogether different from other motor oils. It behaves differently. It gives *instant* and *complete* lubrication! It puts an end to dilution troubles! It cuts down repair bills!

"How can Iso-Vis do all this? How is it different?"—you ask! It's a story that will interest you—a story you ought to know.

While you are plowing corn or cutting hay, a group of men you have never seen are working for you every day in the research laboratories of the Standard Oil Company (Indiana). They are *practical* scientists of long experience and intensive training. Their work is carried on in the field as well as in the laboratory.

For many years these men have been working on the problem of dilution. It's *your* problem—but you have so many others you undoubtedly never have given it much thought.

The farmer, of necessity, usually keeps his car in an unheated garage. On a cold morning it is hard to start. Do you know the reason? Motor oils generally have been so thick in cold weather that the engine could not turn over readily—they would not flow onto the bearings and the engine was not lubricated until after about ten minutes of "warming up" or operating.

Oil of the past was too heavy to start easily. But it soon becomes thin. The fact was established that motor oils lost two-thirds of their viscosity (lubricating efficiency) before the car had gone 200 miles. That was your problem of dilution! You realized it in terms of trouble and repair bills!

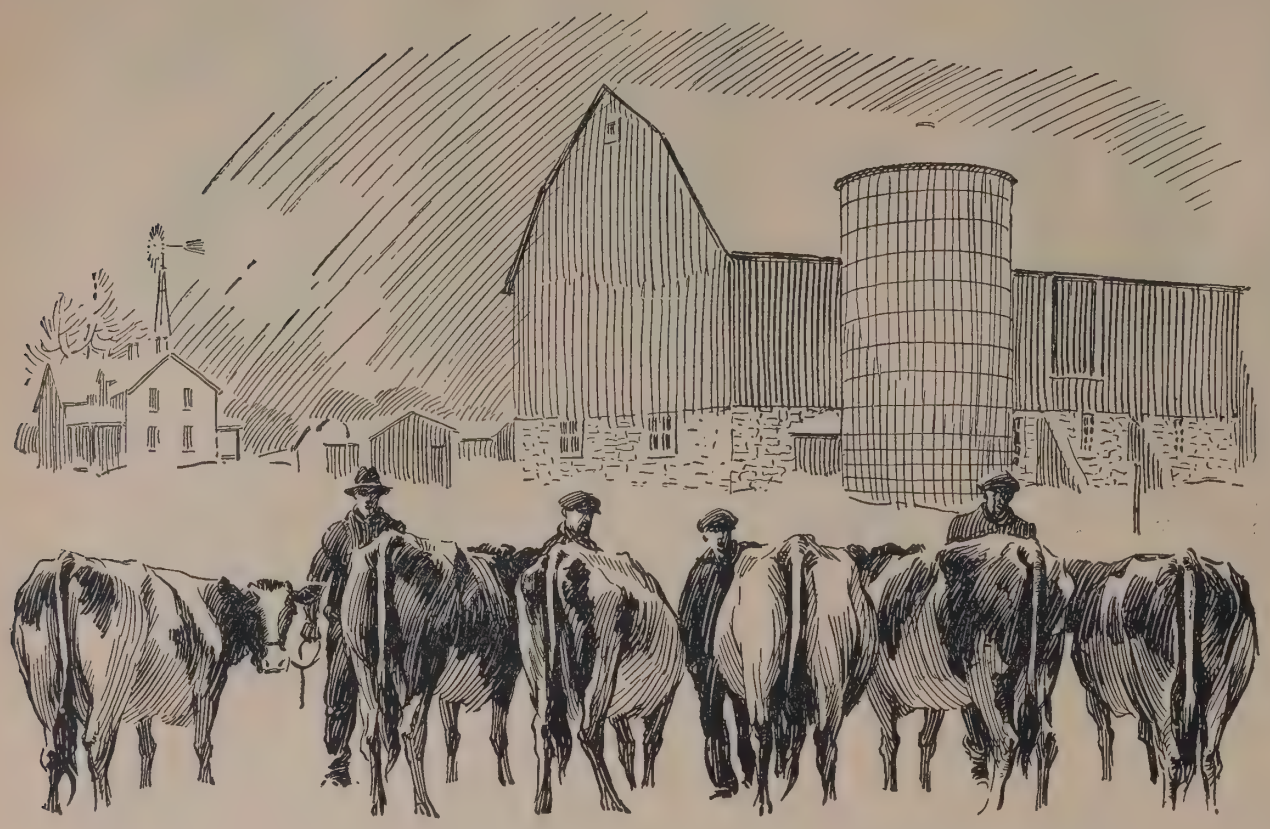
Some people said that nothing could be done about it. But the scientists of the Standard Oil Company (Indiana) followed the farmer's method. They just kept on working. Working to improve the lubrication of your car and your tractor.

Two years ago these men succeeded in solving the problem of dilution. The Standard Oil Company (Indiana) recently announced Iso-Vis, the result of their work, after thoroughly demonstrating its efficiency in hundreds of Standard Oil Company (Indiana) cars and trucks. Iso-Vis is not an experiment. It is an established achievement. Enthusiasm is high. The world's leading automotive engineers say that Iso-Vis is the biggest forward step that has been made in the lubrication of the automotive engine.

Iso-Vis is different from all other motor oils. It is the *only* motor oil whose viscosity stays within the zone of correct lubrication. Iso-Vis has the right body to start with and *it maintains that body until it is drained off*.

No need to worry because the garage isn't heated. No longer is it necessary to keep the "choke" out for miles. Iso-Vis gives *instant* lubrication under extreme cold weather conditions. The oil circulates through the lubricating system immediately. The engine is quick and eager! After a thousand miles of motoring Iso-Vis has not thinned out. Dilution troubles are over when you use Iso-Vis! It costs more per quart, but less per mile!

There are grades of Iso-Vis made especially for trucks and tractors which will save your expensive machinery and reduce your worries and your repair bills.



Iso-Vis is a discovery that will help *you*. The Standard Oil Company (Indiana) offers Iso-Vis as another proof of its friendship for and co-operation with the farmers of the Middle West.

THIS HERD WON A $1,000 AWARD FOR GOOD FEEDING

Farm and winning herd of W. J. Schimmelpfenig, Marshfield, Wis.

"We fed the *right* feed *liberally*"

And Mr. Schimmelpfenig's profit went up 43%

WHEN W. J. Schimmelpfenig got a new manager for his dairy farm at Marshfield, Wis., last March, his herd of 19 Holsteins got a new ration.

Peter Bushman, the new manager, talked enthusiastically about Corn Gluten Feed. He had fed it for 16 years. So, the next day after he came, a load of it arrived at the Schimmelpfenig barn.

The records of the Marshfield Cow Testing Association take up the story here. From April 1 to October 1, 1926, six high cows produced 53,732 pounds of milk. They ate a grain ration of which 39% was Corn Gluten Feed (see ration).

Compare the two years

Now look at 1925. Five of the same cows were in the herd. A sixth, the high cow of that year, is added to make a fair comparison. These six cows produced 38,638 pounds of milk. They ate home grown grains largely, with small amounts of concentrates. "Stump" pasture both years.

Thirty-nine per cent more milk in 1926; 43% *more profit!* For this record, certified by the official tester of the association, Mr. Schimmelpfenig was awarded first prize of $1,000 in the contest conducted by the Associated Corn Products Manufacturers to encourage better feeding.

Good feed, good feeding

"We fed the right feed liberally," says Mr. Bushman.

There is much meaning in those words. This herd was not superior in productive capacity to thousands of others. It was fed Corn Gluten Feed *liberally* — before pasture came and *with* pasture.

In the great dairy sections of the United States *liberal* feeding of Corn Gluten Feed is paying high returns. Test Corn Gluten Feed, for *results*, in your herd. Your dealer can supply you.

THE RATION

Average ration for 6 months of 1926

Corn Gluten Feed (39%)	300 lbs.
Oats	170 lbs.
Oil meal	100 lbs.
Corn	100 lbs.
Barley and oats	100 lbs.

THE RESULT

(the six cows)

	1925 Apr.—Oct.	1926 Apr.—Oct.	Increase
Milk	38,638 lbs.	53,732 lbs.	15,094 lbs.
Profit over feed cost	$524.23	$751.36	43%

DAIRY MARKET NEWS

Twin City November Milk

The Twin City Milk Producers' Association paid $2.50 a hundred for 3.5% milk delivered in St. Paul during November. The association handled 19,413,633 lbs. milk, of which 26% was surplus. Distributors paid $2.60 a hundred for milk, surplus and expense reducing this to a 10-cent spread between prices received by producers and prices paid by distributors.

Cream patrons were paid 58 cents a pound for butterfat in first grade cream during November. This is 7.4 cents above the average price of 92-score butter on the New York market.

December Milk Prices

(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 105 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributors' country plant:

Table I—December Producers' Prices by Geographic Sections

*Basic prices for fluid milk.

Prices paid per hundred pounds for standard grade milk (Grade B, 3.5%) at the dealers' country receiving stations or at the producers' railway shipping points, as also price f. o. b. city, are given in Table III:

Table III—December Prices at Country Stations

	At country station	Freight zones to which prices apply
New Haven	$3.70*	28c rate
Washington	3.02*	35c 10 gal. can
Chicago	2.50	All
Baltimore	2.97*	35c rate
Boston	3.35*	181—200-mile zone
St. Louis	2.20—2.35	34c rate
Trenton	2.85*	41—50-mile zone
Buffalo	2.57*—2.62*	28c rate
New York	3.10*—3.15*	201—210 mile zone†
Cleveland	3.12*—3.19*	All
Philadelphia	2.91*—2.95*	51—60-mile zone
Pittsburgh	3.15*	All
Scranton	2.90	30c rate
Dallas	1.90—2.20	All

*Basic prices for fluid milk. †53c rate.

The following net prices were reported paid to members of producers' associations supply-

ing the cities listed. Prices announced in advance for such cities are usually of two classes, "Basic" and "Surplus," the former applying to that portion of the milk which is used in fluid form for city wholesale and retail trade, and the latter applying to that portion classed as "Surplus," which is used for manufacturing purposes:

Table IV—Net Prices Paid Members of Producers' Associations for 3.5% Milk

Cities	Paid*	Period	Previously announced prices for same period Basic	Surplus
Hartford	$3.83	Oct.	$4.22	Butter markets
Des Moines	2.29	Oct.	2.40	$2.00

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on December 1, figures being given in thousands of pounds (000 omitted):

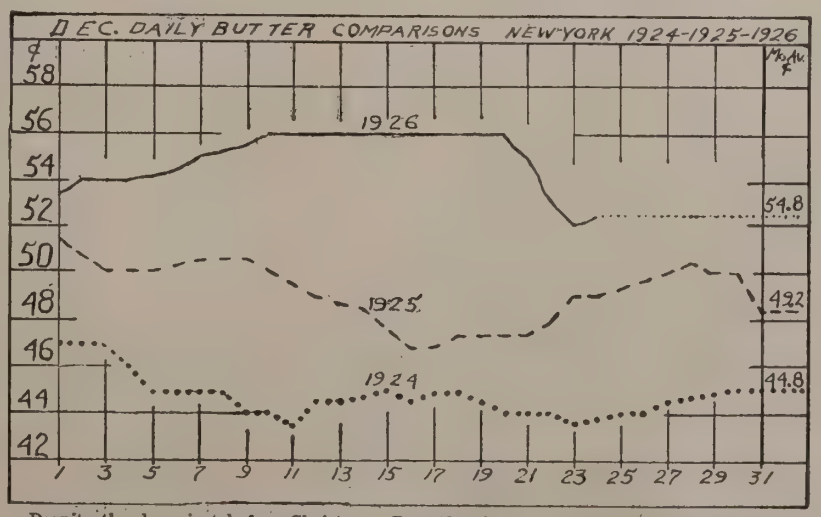
	Dec. 5-yr. ave.	Dec. 1 1925	Dec. 1 1926
	Lbs.	Lbs.	Lbs.
Butter, creamery	67,999	74,754	64,377
Cheese, American	50,333	66,495	63,895
Cheese, Swiss	7,301	9,041	8,227
Cheese, Brick	1,741	2,110	1,535
Cheese, Limburger	1,025	1,292	1,584
Cheese, all other	6,082	5,623	5,766

These holdings include stocks in both cold storage warehouses and packing house plants.

The decrease of butter in storage in November was 36 million pounds as against 20 million pounds in November, 1925, and 33 million pounds average for the same month's average for the past five years. With a continuance of lower production of a year ago, this indicates a strong market condition providing general business conditions maintain their present levels.

Butter and Cheese in December

During the first week in December butter steadily advanced to 56 cents in New York and then maintained this price until the 21st, when a sharp decline of 4 cents took place in less than three days. Similar conditions took place at the other markets, due it is said to apprehension on the part of buyers that the market could not be maintained at prevailing prices. A relatively small import of 16,872 boxes of New Zealand butter at New York and temporary release of butter that had been held up in lake transport, was sufficient to bear the market. Also, more liberal arrivals of fresh butter and a slowing up of demand at Chicago caused that market to register a decline.



Following these declines a more firm tone developed and price advances on all markets were again apparent. On December 27 the New York market ruled firm at 53 cents despite the arrival of 3,538 boxes of New Zealand butter, this imported butter selling for 51 to 52 cents. Withdrawals from storage have continued at a satisfactory rate and in excess of the withdrawals a year ago. Reports on production are conflicting, but the market opinion continues to hold that it is on the increase. This is partly substantiated by the volume of fresh butter arriving in the market, but the onlooker away from the market recalls that this same bearish opinion has been expressed for the past several months and it has not come to pass.

As will be noted in the chart, the average price of butter for the first 24 days in December is five cents above last year and ten cents above 1924, despite a decline in the last four days of four cents. This decline was stopped on the 24th and the advance to 53 cents on Monday is likely to be well maintained for the balance of the month and into January. At least from a pure statistical standpoint, we can see no reason for any further decline.

The cheese market continues firm, with slight advances in price. The average thus far for December is 24.7 cents on the Wisconsin Board, prices advancing from 24.25 cents on the first to 25.25 cents on the 27th. This is a half cent above December of last year and four cents above December, 1924.

November League Price

The New York Dairymen's League announces that the basic net pool price for November is $2.72. This is for 100 lbs. of 3.5 per cent milk in the 200—210 mile zone. It is 14 cents over the October pool price, and 11 cents over that of November, 1925.

Despite the drop just before Christmas, December butter will average five cents above a year ago and ten cents above 1924.

Blatchford's CALF MEAL

Save $10 to $20 on every calf! 1 lb. **Blatchford's Calf Meal** guaranteed equal in food value to 1 gal. milk! Costs only a fraction of what your milk is worth. Easy to feed. Raises big healthy calves. Used and endorsed by biggest stock farms. Most successful and economical milk substitute. Ask any user.

"As the Twig is Bent"

Johnny comes home from school, gives his books and hat a toss; they land, perhaps, on the table or a chair but more probably on the floor and there they stay until mother picks them up. Jimmy is told to feed the chickens right away. He forgets and mother does it. Mary is told to put her room in order, make her bed, hang up her clothes, etc. She does it in a haphazard way or not at all if she is in a hurry to get away. Mother does it, saying as she picks up after them, "Oh, they are just children, they will change when they get older." She is deceiving herself and wronging her children by taking that attitude. It is easier to do the things ourselves than to see that the children do them correctly but we cannot defy or ignore the laws of Nature and get away with it. "As the twig is bent so will the tree incline," is as inevitable as night and day.

We live by habit all the time but they are habits we acquire. We have not one habit at birth; we acquire them each and every one. The first habits are formed in the first few weeks of our lives,—habits of waking at regular hours for food, habits of going quietly to sleep in our cribs at regular hours, or habits of crossness, fretfulness, of crying to be rocked and petted.,

Our system, mind, nerves, and muscles are so constructed by Nature that we learn to do things more easily and quickly by practice, and there lies one of the secrets of habit formation. When we first try to learn something new, playing the piano for instance, we are slow, inaccurate, and have to devote every ounce of our power of concentration to the task but after a while we play more easily and surely, finally we become so accomplished that we can play without conscious effort. The task that was once so arduous and difficult is now a pleasure and an almost unconscious act in so far as the muscular effort is concerned. We have formed a habit; trained our mind, nerves, and muscles to co-ordinate. And so it is with all other habits.

The babe has no habits, but he soon acquires habits of some sort. We can train him to have some certain ones and not to have others. He is like plastic clay in our hands to mold as we desire and like clay he will harden and "set" and the mold into which he "sets" will be, nine times out of ten, the mold into which he will remain throughout life. I made the exception of one in ten for it is not absolutely impossible to break a habit if the desire to do so and the will power is strong enough. The "ifs" are so powerful, however, that it rests on us, the parents, as a grave responsibility to train our children in right habits.

What are right habits? First of all, I would put down absolute and implicit obedience. It should begin [illegible]th. The idea that a baby is too [illegible]ind is erroneous. I do not [illegible]pping or cruelly treat- [illegible]neglecting it, but it [illegible] the mother and [illegible]ild to "spoil" it.

If a child has been taught to be obedient, then training in other desirable habits and avoiding undesirable ones will not be difficult if we, the teachers and trainers, are earnest enough in our desires to put ourselves earnestly and sincerely to the task. Next to obedience and almost on a par with it I would place "health habits," the habits of personal cleanliness, neatness, eating proper foods in the correct manner, deep breathing, correct posture, regular sleeping habits, etc. In building a house the builder is very particular that his foundation is sturdy and true. Good health is the foundation of a good and useful life and into our hands the building of that foundation has been entrusted. Let us be as particular as the builder. Cheerfulness, orderliness, good manners, courtesy, truthfulness, honesty, thriftiness, in fact all the attributes of a desirable citizen can become habits for our children. When habits "set," character is formed. If we could only get that thought burned into our souls, "Habit is the basis of character," how much more watchful we would be of the precious plastic years of childhood.

How can we train our children in right habit formation? James, the great psychologist, gives these three rules: 1. Get initiative. 2. Get practice. 3. Allow no exceptions. By initiative is meant motive or desire. We must have a purpose in view; for the first few years it is the parents who must have the desire. As soon as the children are old enough to realize we can tell them why they should do so and so and inspire them with the longing, perhaps at first with the desire to dress themselves to receive the praise of daddy when he tells them how big they are getting, or to eat the right foods so that they may be strong like daddy or Uncle Dick.

We know it is the novice, the unskilled that is slow and inaccurate in any line of endeavor. To make habits a part of our nature we must keep going over and over the act we wish to fix and we must make the doing of the act pleasurable as possible. In teaching a child to put away its toys or to hang up its clothes we must be persistent. We must have a definite place for each article. To say, "Jessie, put up your clothes" is not enough. We must assign a certain place and say, "Jessie, put your clothes on this hook" and then see to it every day until it comes just as natural for him to put them there as it is for him to come in the house. We must insist on the doing kindly and quietly instead of saying as we often do, "Oh, for goodness sake, Jessie, when will you ever learn to put anything in its place, I just get tired to death telling you not to throw things down." It will take lots of patience and rigorous self control to hold ourselves in hand but if we can't, then it won't be much use to try to train our children for they learn as much by example as by precept.

The third rule, allow no exceptions, is not as easy as it sounds. Perhaps Johnny begs to be excused "just this once," or he forgets and we could far more easily do the task ourselves than call him back and so we let him go that once and then it is so hard to get back into routine again; so much is lost for which we have labored. Until the habit we are endeavoring to establish becomes fixed as an unconscious act, we must be on guard all the time.

If we wish to break an undesirable habit, let us not just forbid the doing of it and then inflict punishment if it is done. A habit once formed becomes a part of our very being and it is very hard to break. We must substitute some other habit, watch for the old habit patiently and kindly and with sympathy, and we must not forget that the blame for that habit is ours. Before you attempt to break a habit in your child, try it on yourself. You will then have the understanding that you should have. It is far easier and more kind to start children right at birth. There are so many influences affecting children today that parents do not have as long a time to train their children as they used to and it behooves us to make the most of the early years of childhood. It all depends on us and we need not expect the discovery of some new moral antiseptic, some new pink pill that can be administered three times a day before meals that will transform children into angels of conduct, thereby giving us relief from care and anxiety. Nothing will ever take the place of constant care and watchfulness and desire on our parts for "as the twig is bent the tree will incline."—GRACE GORDON.

Manners or No Manners

Should parents teach good manners to their children? Some seem to think they might just as well wait until they are old enough to learn what they want to. Others keep nagging the little folks for every error they happen to make and say the children never remember anything they tell them to. Some refuse to take their children away from home

(Continued on next page)

Looking Slim

It is the thought that one gives to clothes that counts for smartness, and a charming style especially adapted for stout figures is found in pattern No. 2461. It is cleverly designed to enhance its slenderness by gathers over the bust and tiny tucks at waist which distribute the fullness properly. See diagram! Step No. 1—just as your material appears after it has been cut out. Step No. 2—the centre-front slashed, which forms the rever, and collar attached; the tucks at waistline inserted and sleeves set into armholes. Step No. 3—the dress practically completed, showing the inverted plaits ready to be made. Cut in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. The 36-inch size takes 4 yards of 36-inch material with ¼ yard of 27-inch contrasting.

Pattern of above style guaranteed to fit perfectly. Price 10 cents in stamps or coin (coin preferred). Address Pattern Department, Hoard's Dairyman, Fort Atkinson, Wis.

while they are small and others take them everywhere regardless of the outcome. How may we reach a happy medium?

Mrs. B., a young mother who had not forgotten her own childhood, decided to try playing manners instead of plain teaching them. Her daughter, Martha, was a typical little homemaker who loved to play house with her dollies. She was having a merry teaparty one day when this new idea popped into her mother's head. So as soon as Mrs. B. could finish her necessary work she stepped into the next room where Martha was playing and asked if she might play too. Of course little daughter was delighted and she listened intently while her mother explained that she was Mrs. Riggs of the Doll's Home Bureau and if Martha wished she would teach her dolls how to act at home and when they were entertained as guests.

Soon big and little mother were very busy placing the tiny dishes and all tableware in the correct places while the dolls, sitting in a row, appeared to be watching intently.

"There, now," exclaimed Mrs. Riggs, "everything is ready. Seat your children and we will begin their good manners teaparty." Mrs. Riggs carefully explained to each doll just how to eat the different foods and to say "please" and "thank you," not one word or act escaping the attention of little Martha.

Many more tea parties were held and some days the dolls were divided between mother and daughter so that Mrs. Riggs and Martha, who became Mrs. Martin, might exchange calls and there was a sharp rivalry to see whose children would behave the better and not only at the table but all through the social call from the "how do you do" to the "good-bye."

As years went on, the play part ceased but mother and daughter still continued to be etiquette partners not only in outside life but in everyday home life. Martha, now grown to a charming young lady, says she will never forget the courtesies she learned in childhood play and she honors her mother who took time to lay one foundation for her daughter's happiness and that of those around her.—LULA A. CAMP.

Don't Drown Your Ferns

With winter here once more, we must begin to think of ways to keep as much as possible of summer in the house. Nothing—that is, nothing but a good supply of heat—helps to keep summer with us as much as house plants that are really flourishing and not the sickly kind that we are most familiar with.

Of all the winter plants, I believe that ferns are the most satisfactory in the long run and here is the advice that I recently got from a gardener who knows ferns just as you do your family:

"Most people," he said, "make the mistake of fairly drowning their ferns. They should always be watered sparingly—just enough to keep the soil moist—and especial care should be taken not to overwater if they are in a jardiniere; never let them stand with their feet in water.

"It helps them, too, if you will occasionally set them in a tub of water and wash thoroughly with mild soap suds, rinsing them well afterward. Mealy bug, a white wooly insect that works close to the bottom of the fronds, is one of the worst enemies of house ferns. If the plant is badly affected, cut off the whole top to within an inch of the ground and let it start again; otherwise make a daily examination and destroy with a toothpick all of the insects. Red spider is another insect that thrives in a dry climate; it is a sucking pest and can be eradicated, as can also the aphis or green fly, by washing or spraying the top with clear water.

"To promote fern growth, apply once in two to four weeks a dilute solution of nitrate of soda—one teaspoonful to a quart of water—or else two teaspoons of household ammonia to a quart of water or manure leachings."—LUCY THOMPSON.

Furnace Cookery

In the present days when the farmer's wife is still valiantly trying to cut down the high cost of living so that it will keep within the bounds of their low income, she has to figure where she can save even a few cents. Few people know that they can use the same fire that heats their homes to cook their meals if it is properly managed. A furnace can be used very nicely for this purpose if you know how to go about it. On the broad ledge inside of the furnace door many things can be cooked and baked.

You might begin by baking potatoes here. It will take from one hour to an hour and a half, depending upon how great a fire you have. After you have baked potatoes successfully, you can try scalloping them, but be sure to cover your pan with a tight lid.

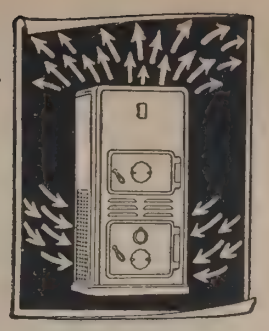
One of the greatest treats offered us is real Boston baked beans. Prepare your beans in the usual way and place them in an earthen jar and cover over. Bake them a long time and occasionally turn the jar around.

In order to roast meat I purchased a small tin roaster for a quarter. It probably measured 8x12 inches. Then placing my meat in and adding a little water, I put it upon the ledge. I found that I had to keep one eye on it and turn it if the fire was very hot. But it surely roasted the meat deliciously. Chicken can be stuffed and roasted here. I place a small square of white cloth over my chicken to keep it from burning and pour my water over that.

Apples may be baked, meat loaf made, soup is delicious when cooked here, and many pop corn in their furnaces.

Many kinds of pudding can be baked by placing the pudding pan in a second somewhat larger pan containing water. I always make my rice and bread puddings this way.

Many scalloped dishes may be prepared, among them scalloped corn, macaroni, oysters, and a dish of scalloped potatoes and ham is a great favorite.



Try cooking in your furnace some day when the fire is low. Watch carefully whatever you are trying to bake and you will have to be governed by what amount of fire and heat you have. If you have an old stove lid you may use this as an extra grate and by laying it upon your ledge it will widen your space for cooking.

This way of cooking proves very handy when you wish to leave a meal cooking for several hours while you are at church or away. When you return your meal will be ready and hot. How much it means to come home from church and have a hot meal that can be set upon the table immediately! Many farmers' wives seldom go to church for this very reason. The family is hungry upon their return and do not care to wait an hour or so for the dinner to cook, and it is dangerous to leave a stove running for so long with no one to watch it. And, oh, how the folks do hate a cold dinner after a long, cold drive.

A whole meal can be left cooking in this way while you are gone. You

FARM Relief *in sight*

"The Lord helps him who helps himself." And farmers *can* help themselves in the South—many of them *are doing it*—farmers who have moved from "the Frozen North" to "the Sunny South".

All kinds of farming can be made pleasant and profitable in this Southland—a land of all-year growing season; of low-cost labor and living conditions; of ample home markets; of schools, churches and good neighbors. And fine farm lands in the South can be *bought at moderate prices.*

Full information will be sent free on request; but this Railroad cannot undertake to find employment for anybody. Write G. A. Park, General Immigration & Industrial Agt., L. & N. Railroad, Dept. H.D.-4, Louisville, Ky.

L&N

may leave soup, roast chicken, scalloped or baked potatoes, Boston baked beans, scalloped corn, and rice pudding all taking care of themselves while you slip away for the little change and rest that means so much to a tired farmer's wife. And by using your brains together with your furnace you can save yourself work, worry, and money and be delighted with the results.—ETHEL MORRISON-MARSDEN.

Embroidery Articles

Stamped embroidery articles as appeared on the color page insert in our December 10 issue are still available and may be had by those who desire them. If you want to refresh your memory as to what the articles were or their prices, we will be glad to send you a list. Address Pattern Department, Hoard's Dairyman, Fort Atkinson, Wis.

How You Get Your Tea

Last winter I was visiting in a big city. Shopping took me one day into a little store where up in front I saw a sign over a small box that read, "The most expensive tea in the world." I was curious and found that it was put up in tiny bags, enough for one cup of tea, for fifteen cents, so I bought one.

I felt sure before and now I am more than ever convinced that the most expensive things are not necessarily the best, for that tea didn't taste one whit better to me than my old reliable grocery store brand.

It is interesting to know how teas are selected for general marketing. It is said that up until the early eighties the United States was merely a dumping ground for tea that other countries would not take. Then a tea inspection law was passed and we now have very strict regulations so that every consignment of tea that is received in this country is opened at the port and a sample taken out. This sample is brewed and tasted by an expert who compares it with a standard tea and passes or rejects it.

The fixing of the standard is an interesting thing. Every year seven men selected from various parts of this country meet in New York and for a couple of days do practically nothing but drink tea, sipping it this way and that from handleless cups as the Orientals do, getting as far as possible the full effect of the flavor.

Of course, this "cup test" is only one of many other kinds by which the standard is fixed and the seven men finish their work by making up packages of the standard they have decided upon and sending them out to all the exporting companies in the foreign countries and also to all the ports in this country where tea is received. By comparing his tea with this standard no tea merchant need experience any loss due to sending to the United States any product that he knows will not meet our tests.

Since tea tasting is such an important thing to the seven standard fixers, it is, of course, important that they know how to brew it in the most perfect fashion. Here is their method:

Take two earthenware pots and fill them with boiling water in order to heat the pots. Pour out the water from one pot and into it put one level teaspoon of tea for every cup that is to be brewed. Add boiling water and allow it to steep for three minutes. Then empty the hot water from the other pot and pour in the tea infusion. The water should be *freshly* boiling. Some people think that any boiling water is all right but water that has boiled too long has had the air driven from it and the taste changed. If you do not believe that, just try drinking some boiled cooled water—LUCY THOMPSON.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coi carefully) for each pattern ordered. Sen your order to Fashion Department, Hoard' Dairyman, Fort Atkinson, Wis. Every pat tern is seam-allowing and guaranteed to fi perfectly. Do not fail to state size.

Our patterns are made especially for us b the leading fashion designers of New Yor City. No stock of patterns is carried in ou office and, since all orders are forwarded t the factory, kindly allow a reasonable tim for delivery of any pattern you order.

Try Our Fashion Magazin

You'll be delighted with a copy of our ne Fall and Winter Fashion and Dressmakin Magazine. It contains all the attractive ne models for afternoon and evening wear. Als house dresses, aprons, lingerie, children' clothes, Xmas gifts that can be made at hom etc. The price of the book will be save many times over by the saving on pattern and in the making of garments. You reall can't afford to be without a copy and, sinc the supply is limited, we suggest that yo send 10 cents for your copy now. Addres Pattern Department, Hoard's Dairyman, Fo Atkinson, Wis.

Hoard's Dairyman patterns cos only 10 cents each. If you are buyin any patterns it will save you mone to buy from us. Fashion Magazin also only 10 cents.

Correspondence Course in Dairying

Last year over one hundred farmers from different parts of the United States and even the Hawaiian Islands took advantage of the practical farm dairy course offered by the North Dakota Agricultural College. Many of these progressive farmers have now completed the course and every one of them have requested another subject in dairying for this winter's study.

One student writes: "I am in the dairy business and I believe that every farmer can well afford the time and effort to take this correspondence course and learn more about his own business. I have enjoyed the course and have learned more than I can express of the subject covered. I have the lessons and my corrected answers filed away in a loose leaf note book as well as clippings from papers and all the Experiment Station and U. S. D. A. bulletins connected with the course, for future reference. I am hoping that your department will offer the second course in dairying this winter as I am very anxious to turn my spare winter moments into scientific study of my occupation."

After receiving many similar letters, the College has decided to offer two dairy courses this winter along the following lines:

Course No. 1 aims to give to anyone interested in dairy production the information needed for the founding of a dairy herd and for the feeding and management of the herd. The best methods used for keeping records on cows and for breeding and raising the future herd are given the consideration they deserve. This will emphasize: the selection of dairy cattle, feed of dairy cattle, the dairy calf, dairy heifers, the feeding and care of milk cows, the herd bull, production records, factors which influence the profitableness of the dairy herd, common ailments of dairy cattle, and the production of high grade milk and cream.

Course No. 2 is given to help the farmers and the cream buyer, the retailer, and the consumer learn about milk and milk products, so that each may know better how to do his part and understand the problems of the industry as a whole. It is given under the following topics: the dairy industry in North Dakota and in the United States; the secretion of milk; the composition and properties of milk; factors affecting the composition of milk, cream, and milk products; the food value of dairy products; bacteria and milk fermentations; the production and handling of high grade milk and cream; the separation of milk; buttermaking; cheesemaking and ice cream making.

Further details and information may be secured by writing the North Dakota College of Agriculture, Agricultural College, North Dakota.

Timothy Hay, Oats, and Corn

I am trying to get my tenant interested in dairying. He has a few cows already but I am not satisfied that he is getting as much production as the cows are capable of giving were they fed a balanced ration. He has timothy hay, corn, and oats available at the farm. Will you advise me as to what would constitute a balanced ration using the above feeds and others that you may suggest?

Davenport, Iowa. W. T. W.

A ration in which timothy hay is used as the only roughage will need a concentrates mixture containing 19 to 20% of digestible protein such as would be had in a high grade mixed feed containing about 24 per cent of total protein. Such a mixture could be made of the oats and corn plus supplementary feeds high in protein. The following mixture is suggested: 300 lbs. of ground corn, 400 lbs. of ground oats, 400 lbs. of bran, 200 lbs. of gluten feed, 400 lbs. of linseed meal, and 300 lbs. of cottonseed meal. These feeds should be thoroughly mixed. The mixture contains 19.3 per cent of digestible protein. We suggest the mixture be fed at a beginning rate of 1 lb. for each 4 lbs. of milk produced daily and the rate be gradually increased to where the cows are getting 1 lb. for each 3 lbs. of milk produced daily. By weighing the milk daily one will find out if the increased allowance of grain is resulting in sufficient increased production to justify the heavier feeding. The timothy hay should be fed to the limit of appetite.

Cow Lacks Persistency

I have a Jersey cow that gives 24 quarts of milk daily for the first 6 weeks after she freshens. She then drops to around 16 quarts and about 2 months after breeding she slumps badly to a gallon or less and thereafter insists on about 3 months' rest. She holds flesh well—is a good keeper—and is 7 years old. I have fed her alfalfa hay, mangels, ground corn, a 16 per cent protein mixed feed, middlings, in addition to which she has had the run of a clover and bluegrass pasture. She has had salt and water at all times. Can you suggest a ration that will cause her to be more persistent in milk?

Ursa, Ill. G. S. R.

Assuming that this cow has had a sufficient quantity of the feeds named, we see no reason why the ration should be changed. Alfalfa hay is the best legume hay to be had; mangels supply as high a quality of succulence as one could obtain; there is sufficient variety in the concentrates fed and the protein allowance is more than would actually be required. We are inclined to the opinion that this cow is already doing about all that she is capable of and that she is following the dictates of her inheritance. The fact that she is in good condition—an easy keeper—indicates that she is getting plenty of feed. It also indicates that she does not have as great power to put feed nutrients into the milk pail as she should have. While persistency in milk flow is somewhat tied up with feeding and management it is also tied up with inheritance, a thing that cannot be changed or influenced. It is unfortunate that a cow so good for a short period did not inherit the character of persistency. There are thousands of cows like this. The unfortunate thing is that too many owners value them according to what they do a few weeks after they freshen and forget what they do not do at the end of 9 months.

Dairymen at Ames

HOARD'S DAIRYMAN:—Farm and Home Week at Iowa State College, Ames, is scheduled for January 31 to February 4, 1927. As in previous years the dairymen have a program for each day of the week. A part of the program will be devoted to judging, a part to feeding and breeding, while other features are to receive attention also. An effort has been made to provide some information on nearly all the dairyman's problems.

Thursday, February 3, has been given over to the meetings of the Iowa State Dairy Association and of the various state dairy breed associations. The special features are talks by C. L. Burlingham, Dr. C. H. Covault, and Dean C. F. Curtiss. Also as a part of the program the Dairy Husbandry Staff will present the results of their two years of experimental work with mineral supplements for dairy cattle. EARL WEAVER.

Iowa State College.

Lloyd S. Tenney Appointed

Lloyd S. Tenny has been appointed Chief of the Bureau of Agricultural Economics, Secretary Jardine of the Department of Agriculture announced today. Mr. Tenny has been acting chief of the Bureau for the last six months.

Mr. Tenny has been with the Department of Agriculture since 1902 except for the period 1910-1921 when he was engaged in fruit marketing work in Florida and New York. He became assistant chief of the Bureau in 1921 and has been acting chief since last June.

Mr. Tenny's former work with the Department had to do with marketing problems and as assistant chief he has been in charge of service and regulatory work on marketing. He is a native of New York State, having been born on a farm near Rochester.

Aunt Ada's Axioms: Making the best of things makes them a lot better.

Wonderful New Milking Method

Milks Cows Like No Other Machine Ever Milked Cows Before

At last something really new in machine milking history! The wonderful new SURGE Milker!

A machine that is making records for Breeders who never dared use a machine before. A machine that produces low count, premium priced milk—and does it with no more work than you now give to washing milk pails. The Surge is sweeping everything before it!

Only These 4 Rubbers To Wash

Think of that! You men who have *tried* to keep old fashioned milkers clean—*mark this!* Only 4 simple pieces of rubber to wash. No long tubes. No claws. No places for the milk to lodge and breed bacteria. Easy to produce Grade "A" milk and get premium prices.

Which is easier to keep clean?

With The Surge Milker the milk travels ONLY 4 inches from Teat to Pail. With other milkers it travels through 4 feet of curling rubber tubes and twisted claws—where bacteria breeds and contaminate the milk. To produce CLEAN milk any milker must be thoroughly washed EVERY DAY. The Surge is so easy to clean that there is no temptation to slight the job.

Mail Coupon For FREE Demonstration Offer

Just mail the coupon below—*now*—and we will install The Surge Milker complete in your barn—*Free*—and show you what it will do on your own cows. No cost or obligation on your part.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

[EDITOR'S NOTE:—You will remember in the last installment of Mr. Gurler's autobiography, published last summer in the August 25th issue, he was discussing the writing of his book. The story is now continued from that point.]

"American Dairying"

Hoard's Dairyman said of my book: "American Dairying," in their issue of November 30, 1894:

"One of the most notable things in connection with practical dairying during the current year is the publication of a practical treatise on that subject, written by a man of wide experience, trained judgment, and skilled common sense. It treats every phase of the question, from the breeding and selection of the cow to the final marketing of the finished product—and this from the standpoint of the year 1894.

"We have read the book with great care—much of it more than once—and the more we read it the better we like it.....He writes of what he knows, of what he has seen and tried, and, unlike too many writers of books, he has the rare gift of omitting the superfluous and the uncertain. ....The result is that he has given us the best book on dairying that was ever written, not too learned or technical for the beginner, nor too verbose or commonplace for the scientist, the expert, or the editor."

The Columbian Exposition

At the formation of rules governing the dairy breeds contest at the Columbian Exposition, Mr. J. N. Pickerell, Secretary of the Shorthorn Breeders' Association, asked me to act for their breed. I replied that I did not own any registered Shorthorns but would act for their breed if he wished me to do so. Mr. Pickerell replied that this was his wish. At this meeting I suggested, argued, and won on the point of the cows being weighed into and out of the contest. Some breeders objected on the grounds that it was not a beef contest. In the contest on cheese produced, one Shorthorn cow produced about the same number of pounds of cheese that she added weight to her body.

I was one of the judges of the butter made in this contest. The other judges were A. N. Barber and Mr. Eldridge on South Water Street, Chicago, both of whom were butter dealers of long experience. We met once a week to judge the butter. I soon decided that I knew each breed's butter. On one judging day I ught the man bringing out the had made a mistake. I went ork again while the other and then told the man mistake bringing us ne breed's butter He looked at the numbers on the packages and referred to his book, and replied that I was correct and that he had made a mistake.

Certified Milk

About 1893 I was approached by a representative of the Chicago baby doctors, requesting me to engage in the business of producing a pure milk for infant feeding. I learned that the doctors' plans were for me to produce and deliver the milk where they ordered it. I gave this matter long thought and reached the conclusion that there was too much risk about the cost of delivery to warrant my embarking in the business on their plan.

This is the gold medal won by H. B. Gurler at the Paris Exposition in 1900 for his highest quality raw milk which kept sweet without preservatives for 21 days. Illustrations show both sides of medal.

I conceived the idea that the economical way to reach customers was through the regular milk dealers who could put the baby milk on a wagon that was going to the locality where it was ordered. I told the doctors I would undertake the work on that plan, and they accepted my suggestion.

The next point was to secure milk dealers who would take the agency for my milk. I soon learned that there was a combined determination not to have one in the field. Dr. Peck, of the Bowman Dairy Company, told my brother when I was ready to start the work, that they would give me just thirty days to operate. The large dealers refusing to take the agency, I was compelled to take such dealers as I could secure with the aid of the doctors.

At that time I was selling to Sidney Wanzer and Sons all the sweet cream from one of my creameries, but they would not handle my certified milk. My customers were secured through the doctors who prescribed the milk and told where to secure it. They did as ordered, just as they would take a prescription to a drug store, and in many cases the family would take their plain milk also from my agents.

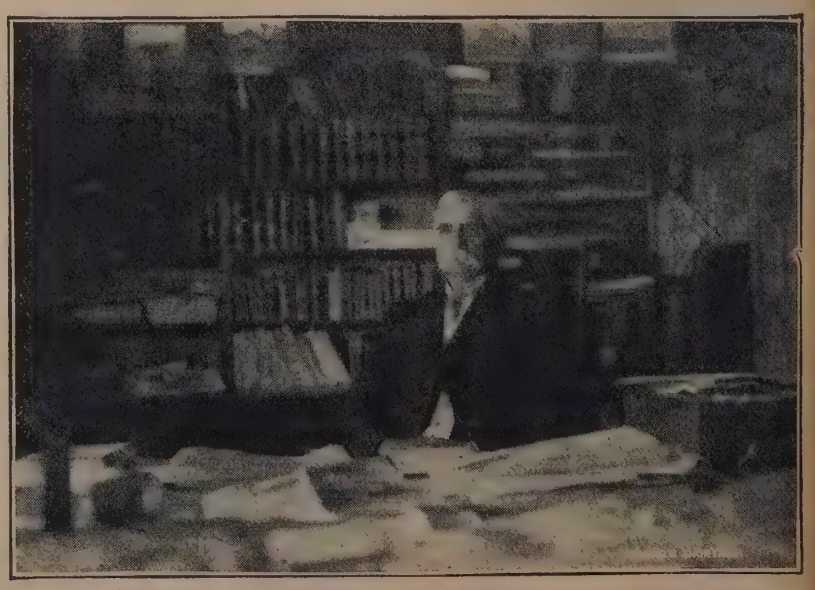
This soon proved a boomerang to the men who were going to put me out of business, and they commenced coming to me to secure the agency. One firm that turned me down at first wished the agency for the whole city. This would have pleased me very much at the start, but I would not go back on the men who took what they thought was a risk. In this work I found it necessary to make a draft on nearly everything I had learned in twenty-one years' work digging into the dairy business.

The production of certified milk was soon taken up by several society people who wished to have something to play with, thinking that their money would secure men who were competent to give experience that they lacked, not realizing the enormous amount of detail to be mastered. This business grew until I was keeping 360 cows at my farm.

In 1900, Major Alvord, Chief of the Dairy Division of the U. S. Dept. of Agriculture, wrote me they were to make a display of dairy products at the Paris Exposition. He requested me to ship some milk for the government exhibit. This request staggered me. The idea of shipping raw milk 4,000 miles in the month of August seemed impossible to me. I had sent milk for babies to the Atlantic coast, also to the Pacific coast.

It took me some days to work up nerve enough to undertake this job, but I did finally reach the conclusion that I should have as much faith in my work as my friends had. In my thinking I hatched an idea and went to the farm to put the idea into effect. I took the milk from the bottling table, after it had been put through the separator to standardize and clarify it, and was bottled ready to ship.

There was no special preparation nor selection as we took the first bottles we came to. We put these bottles into a combination of chipped ice and salt and cooled them down near the freezing point as soon as possible. Then we packed them in ice and started them by express to New York. This milk was seventeen days in transit and kept sweet until it was 21 days old. It kept sweet a day longer, after reaching Paris, than did the milk produced in the vicinity.



The judges believed my milk had been doctored, and had it analyzed before being convinced. They called it a Yankee trick. My reasoning proved correct, i. e., freeze it as soon as possible after milking, pack it in ice to New York, where it went into a refrigerator on board the vessel.

I had visitors at my farm from several foreign countries. The German professor in charge of the Experiment Station at Kiel was one of my visitors, also Dr. Hopkins Heath officer of the city of London, who said as he left my farm that there was nothing in England anywhere near up to my standard.

I finally sold this business to a competitor who had invested $250,000 in a plant with the view of outdistancing everybody, but found he could not hire a man who was able to get there, and he was losing $5,000 per month. After selling this milk business, I was offered $5,000 per year salary to take charge of a milk plant on the Atlantic coast, but had become tired of being nerved up to the point of commanding everything I ever knew about cows and milk.

The Babcock Test

As soon as Dr. Babcock had a machine for operating his test, Professor Henry wrote asking me to come up and see it in operation. I went to Madison and saw the doctor work a test and then worked one myself. I was so thoroughly pleased with the machine that I outfitted myself with a machine and set it up at our De

H. B. GURLER IN HIS STUDY AT WORK ON ONE OF HIS BOOKS

Kalb creamery and we commenced to familiarize ourselves with it.

We selected our Malta creamery as the place where we would commence paying for milk by this test, and commenced to talk to the patrons about it. We went carefully as it was such a revolution in the creamery work that it was not safe to crowd it. So we took considerable time educating the patrons along that line. We were very anxious not to make any mistake, as this was the first creamery that had ever paid by this test, and we had several other creameries and wished to put it in use in all of them.

A favorable sentiment developed gradually, and when the time was ripe, as we thought, we commenced to pay by it. Some of the low testing dairies received less than they had been receiving by the old pooling method, but they had become convinced of the accuracy of the test and made no objections.

I worked with the test all of the first year with this creamery, as I was determined there should be no mistakes made for us to stumble over in the future. After a year's work at this first creamery, we gradually introduced it in all our creameries. Comments about the Babcock test are uncalled for now as every person in the dairy or creamery work knows of it.

(To be continued)

Western Clubsters Compete

HOARD'S DAIRYMAN JUNIORS:—The Pacific International is the big event of the year in club work in the western states. Oregon, Nevada, Utah, Washington, and Idaho were represented this year.

One of the club show features was the colt club from Adams County, Washington, coached by N. C. Donaldson, county agent. The swine classes in the club work were strong as usual. The first live stock clubs started in the Northwest were pig clubs.

Cleo Ott won sweepstakes on the champion pen which was purchased for seventeen cents a pound. There were 27 exhibitors of sheep and goats. Norman Reid, Oregon, exhibited the champion fat lamb which sold for fifty cents a pound.

In poultry judging, a team from Multnomah County, Oregon, composed of Alvin Sheller, Chas. Edwards, and Rolland Sheller, took first place. The highest scoring individual in the contest was Howard Smith from the club representing the city of Portland.

The dairy calf classes were larger than heretofore. There were 70 exhibitors, of which thirty showed Jerseys, twenty Holsteins, while Brown Swiss and Guernseys were exhibited by ten boys and girls each.

Union County had the best record in club work. They were coached by H. G. Avery, county agent. The Union County delegation included Carmen Daniel, winner of the Hollywood Special, who was also third in the showmanship contest, and winner of first place on junior calf and second place on yearling heifer. Jane Daniel took fourth on senior calf and Troy Becker, fifth.

All of the prize winners named below were from Oregon:

Holsteins

Female 2 years old or over won by Walter Andregg; 2, Lloyd Grimes; 3, Lawrence Aylsworth. Yearling heifer won by John Fleming; 2, Carmen Daniel; 3, John K. Grimes. Senior calf won by Orville Blair; 2, Zena Grimes; 3, Jan Burns. Junior calf won by Carmen Daniel; 2, Edgar B. Grimes; 3, Raymond Ulrich.

Jerseys

Female 2 years old or over won by Sven Nelson. Yearling heifer won by Howard S. Loe; 2, Sven Nelson; 3, John Hult. Senior calf won by Helen Schweikl; 2, Howard Loe; 3, Clifford Ekstrom. Junior calf won by Earl Taw; 2, Herbert Kanne; 3, Alvin Tillman.

Guernseys

Yearling heifer won by Floyd Stafford; 2, Elm Petterson; 3, Ragnar Anderson. Senior calf won by Richard Stangel; 2, Melvin Stangel.

Brown Swiss

Female 2 years or over won by Anna Boeckli; 2, Magdelina Boeckli. Yearling heifer won by Sylvia Moser; 2 and 3, Minnie Grossen; 4, Howard Grossen. Senior calf won by Alice Moser; 2, Paul Boeckli; 3 Magdelina Boeckli.

Oregon. F. L. BALLARD.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button showing the head of your favorite breed of dairy cattle, and a handsome Dairy Farm Boy's creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now!

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue Let's talk it over.]

The Christmas issue contains many interesting articles. We are going to confine the review this time to three of them and this order—"Blood Will Tell Even in Worms," "Where Men Have Visions and Dreams Come True," and "The Feeding of Dairy Cows."

How important is the silkworm to Japan? It is even more important than the dairy cow is to Wisconsin. Three hundred million dollars a year is what this tiny worm brings to the Sunrise Kingdom, while Wisconsin's dairy output is about $250,000,000 annually.

How much "silage" do silkworms eat? The eggs are laid by the moth on cards of rice paper about 18x24 inches in size and each card contains about 225,000 eggs. To bring a card of eggs to maturity requires about a ton and a half of mulberry leaves, the silkworm's "silage."

Is the silkworm more efficient than the cow? Yes. A good mature cow producing about 5,000 lbs. of milk a year eats about four times as much protein as is found in her milk. The silkworm secretes 65 per cent of the protein it eats in the silk it makes.

How long is the thread in a cocoon? Almost four-fifths of a mile. Silk strands have a tensile strength a third as strong as a filament of steel of equal diameter.

To what is Mr. Hadley's success due? To his vision of what a profitable herd must be like and might produce, and then following the well-known laws of proper breeding and proper feeding. His 12 grade Holsteins on a rough, stony, New Hampshire farm averaged 13,966 lbs. of milk containing 607 lbs. of fat last year.

What is a ration? A ration is the total amount of feed given an animal in 24 hours.

What constitutes a good ration? A good ration is palatable, has bulk, has succulent feeds in it, and is well balanced, meaning that it has the right proportion of the nutrients, protein, carbohydrates, and fats for maintaining the cow and producing milk.

Teacher: Why should corn be cultivated?

B. B. (Bright Boy): So the birds can find the worms easier.

Opportunity is the only "knocker" that ever finds a welcome.

Message to Hoard's Dairyman Juniors

ON the emblem of our club which every Hoard's Dairyman Junior wears is the relief likeness of ex-Governor W. D. Hoard, pioneer dairy leader and founder of Hoard's Dairyman. Wouldn't you like to know more about "the man on the watch fob?"

Romance, adventure, struggle, tears and laughter are all found in "The Life of William Dempster Hoard," a fascinating new book written by George W. Rankin. It's a story dedicated to young folks and is full of interesting anecdotes. For example:

One day the boy Hoard was watching his grandfather feed the stock out in the yard. Suddenly a ferocious bull attacked the old gentleman. Without a chance to escape he stood his ground. As the bull lunged toward him, he side-stepped deftly, and as the angry beast rushed by, thrust the pitchfork into his side. This operation was repeated several times, until the bull, exhausted, fled out the gate and down the lane where it dropped dead.

The boy Hoard was so impressed that he exclaimed enthusiastically, "Grandpa! You're the bravest man in the world." Flushed with pride the old gentleman uttered this sage advice, "My son, remember this all through your life—in time of danger, take counsel of your courage, never of your fear." And Hoard never forgot!

In order that Hoard's Dairyman Juniors, and others interested, may obtain a copy of this book for "their very own" we are making a special offer. Send in three subscriptions (each three years for $1.00) to Hoard's Dairyman and we will mail you at once "The Life of William Dempster Hoard." A little hustling and you will have those three subscriptions in no time. Who will be the first to earn one of these fine books?

GET BUSY, AND USE THE COUPON!

FARMS FOR SALE

In the San Joaquin Valley of California farming is now a paying business, feeding millions of people in towns. Dairying, hogs, poultry and fruit should yield a good income. A small one-family farm, with little hired labor, insures success. You can work outdoors all the year. Best crops to plant are well proved. Selling is done co-operatively in established markets. Newcomers welcome. The Santa Fe Railway has no land to sell, but offers a free service in helping you get right location. Write for illustrated San Joaquin folder and get The Earth free for six months. C. L. SEAGRAVES, General Colonization Agent, Santa Fe Railway, 951 Railway Exchange, Chicago. 26-6

Dairy farmers are needed in the South to supply growing demand for dairy products. Locate in Black Soil section of Alabama where you are assured of making a success. Large creamery at Selma. Plantation has been divided up into suitable acreage. Lime lands can be bought at low prices. No need to have your cattle housed up all winter. Why try to fight the uphill game of farming in a cold country when you can make money and enjoy pleasant living in the balmy South? Write to me for your free copy of Southern Field and reliable information about this country. W. E. PRICE, General Immigration Agent, Room 604, Southern Railway System, Washington, D. C. 24-*

North Florida Dairy Farms. No tuberculosis. Lowest summer price for milk $5.80 per hundred. Beautiful, high, rolling country. Permanent all year around legume and grass pastures. No feed to buy. No blizzards or hurricans. Cooler in summer, warmer in winter than your country. Improved farms ready for plow $25 to $50 per acre. Easiest terms. Splendid water, good roads, schools and churches. Many Northern farmers with pure bred herds now here. Land values rising. For details write CHAMBER OF COMMERCE, Monticello, Florida. 27-4

Dairy Farm in South Florida For Sale—Finest herd of Guernsey cows in state, many purebloods, some imported. In sight of depot and express office, in easy reach of Palm Beach, Miami and Tampa. Close to two growing cities. Price from merchants and stands eighty cents, retail customers, one dollar and winter customers one dollar and a quarter per gallon. Fine barns, milk house, silo and York ice machine. Fine muck land, well drained. Feed in abundance can be raised. Good reason for selling. Write C. H. F., BOX 3390, Tampa, Florida. 27-2

2000 Middle West farmers moved to Oregon in last two years, after thorough investigation. They like our mild winters, cool summers, with no severe storms to ruin a season's work and destroy property. Fine roads and schools, productive soil, good markets for your products. Write for official bulletins and illustrated booklet of facts, Free. LAND SETTLEMENT DEPARTMENT, PORTLAND CHAMBER OF COMMERCE, 233 Oregon Building, Portland, Ore. 25-4

Attractive farm property for sale—500 acres in heart of rich and beautiful farm area, near Hartford, Wisconsin, Washington County. Thirteen substantial buildings in excellent condition, including grain elevator, cow barns equipped with eighty James stanchions, calf and bull pens, large hay barn, ice house, sheep and hog barns. Four concrete silos. Buildings wired for electric lights. Complete water system. For particulars and price, address E. L. PHILIPP ESTATE, Station "C," Milwaukee, Wisconsin. 25-4

Wonderful Opportunities for economical dairying and chicken raising. Write CHAMBER OF COMMERCE, Quitman, Georgia.

Farm Help Wanted—Working manager and single man. State wages and experience, HERMAN KNOLL, Ottawa, Illinois.

Brown Swiss Shipped to Peru

One of the first sales of Brown Swiss from this country to South America was recently made by W. O. Bohart, who sold 65 head from his Montana farm to the Cerro de Pasco Copper Co. of Peru. It is the company's intention to cross Brown Swiss bulls on the native cattle.

A co-operative creamery should not be started until farmers owning 800 cows or producing 150,000 pounds of good quality butterfat a year have signed an agreement to deliver their cream to the creamery for from three to five years. A local creamery that will accept poor quality cream is doomed to failure.

Are You Killing Off All Your Buffaloes?

"Willful waste makes woful want," and to rent is to waste.

Fifty years ago great herds of buffalo roamed the plains of America and afforded the plainsmen an ever ready commissary. Hunger was unknown. Even in the most unfrequented sections of the Middle West, a delicious dinner of half beef, half venison flavor was a matter of a few moments only, and the meat course of the pioneer's meal was always fresh.

But the farmers of the East were buying buffalo robes to keep themselves warm when they drove to town on winter mornings. Robe dealers were paying a pittance for the hides and the plainsmen were short-sighted. Day after day they stalked the magnificent herds. Thousands and tens of thousands of carcasses were left to decay on the ground every year. No more willful waste is recorded in history, and the plainsman lived to see the result of his folly. He awoke one morning to the realization that the buffalo was gone. His kind was all but extinct and the plainsman had profited practically nothing from his wholesale slaughter.

The buffalo was the victim of thoughtlessness and mismanagement in the time of plenty. He was like your rent dollar. One by one your rent dollars drop into your landlord's pocket, and you get in return even less than the plainsman realized on his hides.

Have you ever counted the rent dollars that have gone that way? Figure it up—then think where you might be today if you had applied them to a good piece of dairy farm land in Wisconsin. It isn't too late. Write now and let us explain how you may store your rent capital and become an owner of a fine dairy farm in the greatest dairying State in the Union.

Vest Pocket HERD BOOK

(Made by Hoard's Dairyman)

There's room for a sketch, ancestry and record of 100 head. There's an index, a 1927-1928 calendar, a gestation table, a breeding record and a dozen blank pages for reminders. It's loose-leaf, with a mighty handsome and durable genuine leather cover.

One proud herd manager we know has carried one right with him for two years, and says it looks as good today as it did the day he got it.

And the price is only two dollars postpaid.

Feeding is one thing in swine husbandry but saving large numbers of pigs per sow bred is quite as essential. To do this one must know the causes of pig losses and their relative importance before he can do the right thing at the right time. The article below discusses the causes of pig losses.

Causes of Pig Losses

In some swine cost of production studies made by the U. S. Department of Agriculture in Iowa and Indiana in 1922, 1923, and 1924, we find some interesting data relative to the causes of pig losses from farrowing time to weaning time and their relative importance.

Averaging the figures for the two states for the three years we find that for every 1,000 pigs farrowed 331 were lost from various causes by the time the surviving pigs were weaned. Large litters of pigs weaned per sow bred is a very important item in production costs. Knowledge of the causes of loss and the relative importance of these is valuable in so far as it enables one to place the prevention emphasis at the right place.

Forty-seven per cent of the pigs lost met their death by being laid on by the sows. Next in importance are dead and weak pigs when farrowed. These two causes account for 22.8 per cent of the losses. The next important cause is from pigs being chilled or unduly exposed. The other causes given in order of number of pigs lost by them are: Pigs starved, pigs eaten by sows, pigs injured, scours, sore mouths, smothered, thumps, cholera, milk fever, and overheating. Miscellaneous causes account for 11.7 per cent of the total losses.

Arranging these causes by groups we find that pigs overlaid, chilled, injured, eaten by sow, overheated, and smothered account for 58.6 per cent of the total losses. Pigs born dead and those too weak to survive account for 22.8 per cent of the losses. Malnutrition and diseases account for 6.9 per cent of the total losses and of these, pigs starved and pigs lost from scours are the most important.

The first group of causes would require more constant and careful attention at farrowing time and for two weeks thereafter to reduce the losses. The second combined causes resulting in dead and weak pigs would call for better feeding and management of the pregnant sows to reduce the losses. The third group of factors causing loss would require better sanitation and a little closer attention to the pigs after they have escaped the farrowing hazards. The miscellaneous causes would require, naturally, attention of a miscellaneous character and these losses would be reduced by a closer attention to preventing losses from the other causes given.

Protein Supplements Compared

The Minnesota College of Agriculture exhibited 5 lots of pigs at the Minnesota State Fair last fall which demonstrated the efficiency of buttermilk as a protein supplement when compared with tankage, rape pasture, middlings, and no supplement. The pigs were started at an average weight of 47 lbs., and fed for 80 days.

The rations fed each lot were about the same except in the character of the protein supplement. Shelled corn, ground oats, and mineral formed the basis of the ration and was fed as an entire ration to one lot of pigs. This lot did the poorest of any, weighing on an average of 87 lbs. at the conclusion of the experiment and the cost per pound gain was 9.1 cents.

The first lot was fed shelled corn, ground oats, buttermilk, and a mineral mixture. They weighed at the conclusion of the experiment an average of 162.6 lbs.; their cost of gain was 5.4 cents per pound. This was the heaviest lot and made its gains the cheapest.

The second lot received tankage instead of buttermilk. They finished at 127 lbs. weight and 6.7 cents cost per pound of gain. The third lot received rape pasture in place of the buttermilk. They finished at 124 lbs. weight and a cost per pound gain of 7.1 cents.

The fourth lot got a ration of shelled corn, middlings, and mineral mixture. They finished at 111 lbs. weight at a cost per pound gain of 5.5 cents. All the pigs in the five lots were fed 80 days. The high value of buttermilk as a protein supplement for feeding pigs was conclusively demonstrated.

The necessity for feeding a protein supplement is brought out forcibly by the results of another Minnesota experiment in which the feeding was carried on for 125 days.

Pigs denied such feeds weighed but 114.8 pounds each at the end of the feeding period, while those in a lot given buttermilk weighed 236.13 pounds each. Another lot which received tankage instead of buttermilk weighed 180.53 pounds each. The feed cost of 100 pounds gain was for the first lot $8.23. for the second $5.84, and for the third $5.98. The pigs were of uniform weights at the start.

Helping the Fall Pig

A ration composed of corn, tankage, chopped alfalfa hay, and linseed meal makes fall pigs grow approximately as well as spring pigs, according to F. B. Morrison of the Wisconsin Experiment Station.

The corn should be fed in a self-feeder. A mixture of 50 pounds of tankage, 25 pounds of linseed meal, and 25 pounds of chopped alfalfa hay should likewise be fed in a self-feeder but separately from the corn. If one attempts to feed the four feeds separately the pigs will not eat enough of the linseed meal and chopped alfalfa. The alfalfa hay supplies a good quality of protein; it supplies essential vitamins for normal growth and it supplies bone building substance—lime and phosphorus.

Milwaukee Electric Is Selling $2,000,000 of 6% Cumulative Preferred Shares at $100, to Savings Investors

If your savings are less than 6%, this advertisement offers you an opportunity to increase your income. If you have idle money, it offers you a chance to put that money to work where it will be safe, and where it will earn $6 a year per $100, paid by checks mailed to your address March 1, June 1, September 1 and December 1, every year. If you are not satisfied as regards the safety of your present income investments, this advertisement offers you an opportunity to transfer your funds to an investment in Wisconsin's largest and strongest State-regulated public service company.

The Milwaukee Electric Railway & Light Co., with the State's approval, authorizes Securities Department to offer direct to home investors a $2,000,000 issue of its 6% cumulative preferred shares. Money got for the shares will pay for income-producing additions to the Company's public service property.

The shares sell at $100 each, payable all cash or $10 down and $10 per share monthly for nine months. Dividends on paid-up shares start the day you buy them. Interest at 6% is allowed on monthly payments, credited on the last payment. If you do not finish your payments, you get back all you have paid in, but without interest. Buying either way, you get 6% annual income on every dollar invested from the day you buy these shares. Equally with all earlier preferred shares, these shares have a first claim on the Company's dividend earnings, and on its assets to full face value, in case the business is ever sold or dissolved, ahead of the $19,000,000 of outstanding common stock. The dividend priority of these shares is CUMULATIVE—that is, dividends of 6% must be paid on these shares every year before the holders of the common shares can get any dividend on their shares. The safety of these shares is indicated by these facts: the Company, now thirty-one years old, has paid every obligation on the due date, in cash and in full, since it began business. It has paid cash dividends in full on its preferred shares every three months for the past twenty-seven years. It has paid cash dividends on its common stock, averaging 8% annually, every year for the past twenty-four years. It is today one of the strongest, best built and best managed public utility properties in the United States. It serves one of the richest, solidest industrial districts in the United States. It is a permanent, necessary industry. Its business grows larger every year. Most of its growth is still ahead of it.

The 6% dividend rate is dictated by the present and probable future cost of capital for first class preferred shares in this part of the country. Back in 1921 Milwaukee Electric sold an issue of 8% shares—forced to it by then current high capital costs. Since then that issue has been called in and paid off at $103 a share. Later, with capital costs lower but still above normal, the Company sold issues of 7% shares. Those shares, still outstanding, cost their buyers $100 each and are worth today, on a 7% income basis, at least $110 a share. The 6% shares now offered at par $100 are worth par, measured by the rate and safety of their income. Capital costs have fallen this far since the World War, and may fall still lower in the years to come. These 6% shares are callable at $110 each, plus accrued dividends to date of call.

Big investors are not barred, and it is likely some good-sized blocks of these shares will be bought by rich men and women who realize that dependable, permanent, 6% income investments are hard to find, and bid fair to become even scarcer hereafter. We wish, however, to sell the shares, so far as possible, to our customers and other friends here at home who want a business rate of income from their savings. Milwaukee Electric and its associated utilities in Wisconsin and Upper Michigan have close to 25,000 satisfied home shareholders, all naturally interested in helping increase the business. The sale of this issue is expected to add 2,000 to that number and at least 1,000 of our present shareholders will enlarge their interest in the business by purchasing shares of this issue.

These shares are on sale at Securities Department, Public Service Bldg., Milwaukee, at the offices of Wisconsin Gas & Electric Co. in Racine, Kenosha, Waukesha, Watertown, Burlington, Whitewater, South Milwaukee and Cudahy; at the offices of Wisconsin Traction, Light, Heat & Power Co. in Appleton and Neenah-Menasha; at the office of Badger Public Service Co. in Plymouth and at the offices of Peninsular Power Co. in Iron Mountain, Michigan. Mail orders will be filled promptly by registered letter. Address

Poultry on the Dairy Farm

A Poor Way to Start

I would like to get some information in starting in a small way to raise chickens. I am not intending to do much in egg production but chickens for market. I want to find out something in the way of what buildings I need to get started, say, about 500 to 800 the first year. I have a farm of 200 acres, all in fine shape, fine buildings, and want to make a little extra money in chickens.

Oshkosh, Wis. F. H. H.

I very much believe that the method which you contemplate is doomed to failure in the very beginning if you start with the expectation of carrying from 500 to 800 chickens the first year without any previous experience and expect only to cater to the market poultry end of the business without an attempt to get egg production.

We look upon egg production as the principal source of income from poultry and the meat side of it is rather a side product which we market to our best advantage.

It is possible to produce quality eggs and place those on a market which will pay a premium for them. Such is not the case with poultry. Anyone of the marketing establishments, either private or co-operative, can take the average run of poultry as it is received from farms and can sort these birds out into their respective classes and by putting them through a proper finishing and feeding period and dressing them out they are able to make from this sort of a mixed and motley collection a choice article which will obtain a premium when marketed. This entirely prohibits one from catering to any special market which will pay the premium, since it is easier and more feasible to take the average run of stuff and sort out of that the quality with a low overhead than one would encounter in a private enterprise of this sort.

If you wish to take one of the medium weight breeds, or one of the so-called "dual-purpose breeds," such as the Barred Rocks or Rhode Island Reds, which are cited as an example, and breed these for egg production or keep them for egg production, that is an entirely different story. It is possible to breed up any one of these or to obtain high production strains of any of these varieties. In this case, however, a person is keeping them for the egg production, and then disposing of the surplus fowls to the best advantage that the market offers.

There has been some attempt made to revive the winter broiler industry during the past year, when enough has been known about poultry nutrition to compile a ration that will prohibit the development of leg weakness in the chicks. This has resulted in a few instances in a considerable number of winter broilers being placed on the market.

One even then is competing with the lower price product since the demand for quality broilers is undoubtedly rather limited and it is possible for the average person to obtain cold storage broilers. These are usually birds that have been hatched late in the year, come on the market in the fall while still small, and in classifying these they are graded out as broilers and go into storage under that grading.

If the start is to be made in some one of the counties that has a county agent, I should advise you to get in touch with him, since he is the logical clearing house for you to consider and will be able to put you in touch with some poultry minded person in the county that has good equipment, is practicing good methods, and is making a success of his poultry work. Usually the closer to home that we can get these instances, the more successful we are going to be.

It will be rather a hopeless job to attempt to outline or to list the successful parties that might be required in order to have them within access of your present location.—J. B. HAYES.

The Champion Hen

HOARD'S DAIRYMAN:—What is declared to have been the greatest egg laying contest ever staged has just been concluded at the Dominion Experimental Farm, Agassiz, and as a result British Columbia is now very much in the limelight as a poultry breeding center.

Hen No. 6, in the White Leghorn pen entered by the University of British Columbia, with a total production of 351 eggs in the period of a calendar year, has beaten all previous records. The previous record for this continent was 335 eggs laid at Puyallup, Washington, but New Zealand claimed a record of 342 made by a hen owned by Mr. Drewitt of Christchurch, in 1923, while Australia had a record of 347, made at Gatton, Queensland, in 1924. All these records were easily beaten. The hen laid 200 eggs without a break and during the year had only 14 rest days! Yet after the contest she was in splendid shape and weighed 4.4 lbs. compared with 3.5 lbs. when she entered.

But equally wonderful was the performance by a Barred Rock in the pen entered by the Experimental Farm which laid 326 eggs. This also beats the world's record for the breed which, it is claimed, was held by a Barred Rock entered in last year's contest and also owned by the Experimental Farm which laid 321 eggs.

An Ancona hen with a production

Professor Lloyd and the champion hen with a record of 351 eggs in a year. The hen is owned by the University of British Columbia, Canada.

of 257 eggs also beat the Canadian record for that breed.

Forty-six pens, each containing ten birds, were entered in the contest, the breeds represented being as follows: White Leghorns, 36 pens; Anconas, 2: Barred Rocks, 3; Rhode Island Red, 2; White Wyandottes, 3.

In the contest, points were given according to the weight of the eggs. Eggs weighing 24 ounces to the dozen were taken at par; those scaling an ounce less were docked a point and those averaging heavier were given a higher score.

The University pen laid the greatest number of eggs—2,946—but they only scored 2,829.6 points and the pen, on points, was seventh in the contest. The winning pen—White Leghorns—was owned by F. W. Appleby, of Mission, with 2,556 eggs which scored 3,057.5 points. J. H. Mufford & Sons, the owners of last year's winning pen, were second with 2,457 eggs scoring 3,048.3 points.

The average for the 460 birds in the contest was 231 eggs.

British Columbia. A. H. COTTON.

Soft Shelled Eggs

I have a flock of White Minorca hens which started laying about three weeks ago, but now start laying soft shelled eggs. I feed them oats, wheat corn, cod liver oil, egg mash, oyster shells, and charcoal. What can be the trouble and what can I do for this?

New Germany, Minn. (MRS.) F. O.

The cause for the soft shelled eggs produced by this flock may be due to any one of several different things. It has been found that soft shelled eggs are produced by hens that have been injured, such as that occasioned by a fall, and it may also be caused by the birds being frightened. In this case the eggs slip by the section in which the shell is formed without deposit being completed.

One way in which this injury can be eliminated is by placing the roosts on a level rather than putting them at a slant such as one so often finds, particularly in older types of poultry houses. The flock in endeavoring to roost at the highest point, which means the top roost, causes a certain number of them to fall off with the result that injury often results. It may not be indicated in any way other than in soft shelled eggs.

A second cause comes from frightening them. A person should always be careful in approaching a house that has a good bunch of producing pullets, to let them know you are coming before you rush in on them.

The third should be taken care of in the fact that you are using cod liver oil as a part of your feeding ration. I presume that this is used at the rate of 2% to the mash, or that about one quart is added to about 100 pounds of the dry mash mixture and that your mash consumption is held up to the proper level by the control which you exercise in the amount of grain offered to them.

The cod liver oil should not be taken as a sole cure for this trouble, since one should also take advantage of whatever direct sunshine may be obtained by opening the windows whenever the sun is shining, allowing the sun to shine directly on the birds. The combination of the two is preferable to the use of the oil alone.

Any one of these three may be the cause of it and a person should decide to check up on it in order to eliminate it.—J. B. HAYES.

Pacific Butter and Poultry Meeting

The fourth annual convention of the Pacific States Butter, Egg, Cheese, and Poultry Association will be held at Salt Lake City January 31, February 1 and 2, 1927. It is doubtful if the association has ever had so many important events lined up for a convention. Special features include, besides the business meetings and luncheons, scenic trips in and about Salt Lake City, visits to the state capitol, the famed "Mormon" Temple and Tabernacle, a "bob" sleigh ride—weather permitting, or a cabaret dinner dance, and a visit to the world's largest open-cut copper mine.

Program and other details may be secured by writing J. A. Nelson, Newhouse Hotel, Salt Lake City, Utah.

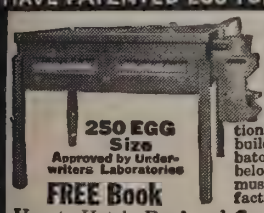
Wisconsin Poultry School

The Fifth Annual Poultry School during Wisconsin Farmers' Week will be held January 31—February 4 at the Poultry Building, Madison, Wis. Sessions will be held daily from 8—11 a. m. and 2:30—5 p. m.

As an accommodation to parties interested only in a certain phase of poultry keeping, the program has been arranged for that purpose. Monday, Poultry Diseases and Sanitation; Tuesday, Marketing; Wednesday, Breeding and Incubation; Thursday, Feeding and Nutrition; Friday, Turkeys, Capons, and Dressing Demonstrations.

An excellent staff of speakers has been obtained to assist along particular lines.

There is no charge or tuition during this school, and an invitation is extended to attend all or any of the days.



POULTRYMEN REPORT 80% to 94% HATCHES

One Pull Turns Every Egg

Miller's Patented Trays are the greatest forward step in incubator construction. All eggs turned in one minute. Save time, insure bigger hatches and stronger chicks. Users report 80% to 94% hatches.

"IDEAL" Incubators have many exclusive features, tested and proven successful. Our 38 years' experience enables us to offer the best incubator in construction and performance. They give universal satisfaction, produce bigger hatches and require little attention.

MILLER'S "IDEAL" INCUBATORS HAVE PATENTED EGG TURNING TRAYS

250 EGG Size
Approved by Underwriters Laboratories

In Miller's "IDEAL" Incubators you get all of these time and money saving features at no extra cost. Volume production enables us to build superior incubators at prices well below what others must charge. Satisfaction Guaranteed.

FREE Book

How to Hatch, Feed and Care for Chicks. Describes Miller's "IDEAL" Incubators, Brooders, Eggs for Hatching and Baby Chicks. WRITE TODAY! Bargain Prices.

NOW FREE SHOEMAKER'S POULTRY BOOK

Shows and describes $3 varieties of Old Reliable Strains of SHOEMAKER Blood Tested Flocks of PURE BRED POULTRY Backed by 38 years of breeding prize winners. Gives many useful facts about handling, feeding, diseases and remedies. Quotes LOW PRICES on fowls, eggs, CHICKS, Brooder Stoves and supplies. Write for this valuable BOOK — it's FREE.

C. C. SHOEMAKER, Box 103, Freeport, Ill.

LOWELL'S

COW CLEANING PRESCRIPTION

Is Guaranteed to cause the cow to clean within 48 hrs. when used as directed or money refunded. It relieves GARGET and is a preventative of MILK FEVER. It has the effect of restoring the vigor and strength of the cow. Sent post paid, $1 a pkg 6 for $5

Mfg. by Lowell Blaisdell & Co.
5804 N. Harlem Ave. CHICAGO, ILL.

Horns Can't Grow!

After using TOMELLEM PASTE on calves up to 2 months old. An easy and safe way to do away with dangerous horns. One application enough. No bleeding, soreness or scars. Endorsed by county agents. Keeps indefinitely. Bottle sufficient for 50 calves. $1.00 Postpaid. At dealers or direct by mail from

TOMELLEM CO., Dept. B, CALICO ROCK, ARKANSAS

Have a Better Farm

Good fences will enable you to have a better, more profitable farm. They permit modern, diversified farming, more live stock and poultry, easier marketing and more fertile soil. They distribute the work, save hired labor and make each field yield more profit.

SuperZinc-ed REG. TRADE MARK

Pittsburgh Perfect and Columbia Fences

are designed to give the greatest possible service per dollar invested. They are made from our own formula of steel which has unusual strength and an affinity for the heavy zinc coating which insures great durability. Both the Columbia and Pittsburgh Perfect brands have proven their merit under the tests of severe service. Buy the dependable Super-Zinced Fences for your spring fence improvements.

Guaranteed

All of our fences are Super-Zinced, that is, armored against rust by the heaviest coating of zinc that can be successfully applied to wire, and are guaranteed unexcelled in quality and durability. Look for our brands when buying fence, barbed wire, gates, steel posts and wire nails. Write for catalogue and our excellent new booklet, "Farm Records", mailed free upon request.

I want More Money from your farm

W. O. Morgan, Richland, Ia., Wm. Luscombe, Fairmont, Minn., A. C. Hanson, Inwood, Ia., Carl Schultz, Russell, N. D., J. M. Hiner, Reed Point, Mich., S. A. Wyrock, Lewistown, Mont., and other practical farmers give some interesting experiences with good fences and show how to turn losses into profits. Let us send you their stories.

RED STRAND "Galvannealed" FENCE

Know why we use more copper in our steel and cover the wire with a heavier zinc coating to make Red Strand "Galvannealed" last many years longer.

Thousands of farmers have used Square Deal fence for many years. Now, with more copper and a heavier zinc coating, they like the new Red Strand "Galvannealed" better than ever, especially when they know that this longer lasting, finer fence costs no more per rod than any other standard make and that it costs less per year because it lasts so much longer.

Hundreds of careful buyers are writing us daily to find out about Red Strand "Galvannealed" before they invest in any more fence. It will pay you, too, to get all the facts. Ask your Red Strand fence dealer or write us.

Milk While They Learn

(Continued from page 9)

pointing to the record of a previous month, "that some students make a mighty high net profit. Here is the column of one girl who made a net profit one month of $25.49. another of $24.34, and here is one that made $16.19. The average net profit for the entire fourteen students is about $15.00 per month. The room and board at the school is only $12.50 per month, so you can readily see that all of the students who are milking cows earn their room and board and some of them double it. In order to take care of the students who happen to get a low producing cow, we make a change every month so that the student who happens to have a low producer one month will get a high producer the next month and in that way we even up the amount that each student earns over the entire school year.

"Let me say just a word about the type of students that we have working here in the dairy. They are student leaders and most of them engaged in all kinds of student activities. In some schools the tendency is to shun the student who has to work to defray expenses. To get around that kind of snobbery, I made an attempt to get some of the most popular students to take a cow and care for her. Now our best students are the ones that are wanting to earn their way in this way. These students, and most of them are girls, get up at 5:30 in the morning to milk, and they milk again at 12:30 and at 8:30 in the evening.

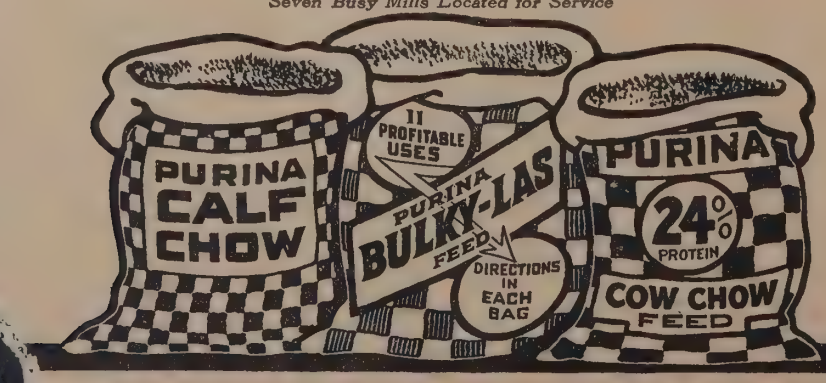
We have a fine spirit here among the boys and girls. They are all rivals and what they are learning in actual experience is taken up in lecture work and the information emphasized. "We have worked the plan for over three years now and find that it is a success. We have found that a cow must make at least three gallons of milk per day to pay a student to milk her. I believe that when these students go back to their homes on these Arkansas farms they will not keep a cow that produces less than three gallons of milk per day and some will not be content with that. Their lessons in feed and care will remain for a long time.

Buying Cow Chow Cheaper

THE PRICE you pay for Purina Cow Chow doesn't depend entirely on the Mills or the dealer. You, yourself can reduce the price of it.

1—You know just about how much you will need. Talk this over with your feed dealer. Find out when he expects to have cars coming in.

2—Arrange to take your Cow Chow off the car.



3—Buy Cow Chow in large quantities and pay cash for it. Credit for each ton can be bought at the bank for about 35 cents a month.

4—Get your neighbors to use Cow Chow. Your dealer is able to supply several large users in one neighborhood cheaper than just one user.

For three straight years the price of Purina Chows has been reduced through additional volume. See the feed dealer with the checkerboard sign.

"Use Phosphate—It Pays"

It shows good business judgment to buy phosphate and apply it to grain fields, state A. R. Whitson and Griffith Richards of the Soils Department at the Wisconsin College of Agriculture in a recently issued special circular entitled "Use Phosphate—It Will Pay."

They point out that—

Legume crops will produce heavier yields if supplied with plenty of phosphate.

Phosphate will hasten the maturity of small grains and corn from one to two weeks.

Phosphate is constantly leaving the farm in crops, bones of animals, and milk sold.

Phosphate will be lost no matter how carefully the manure is handled.

On the average Wisconsin farm for every dollar spent for phosphate a return of from $2 to $4 may reasonably be expected.

How may phosphate best be applied and in what amounts?

The greatest money return will be obtained by broadcasting for the small grain crop with which alfalfa and clover are sown. As to the amounts per acre:

45% phosphate—100 to 125 lbs.
20% phosphate—200 to 250 lbs.
16% phosphate—300 to 375 lbs.

Phosphate may be sown with a grain drill equipped with a fertilizer attachment at the same time the grain is seeded; it may be applied with a two-wheeled, hopper type, lime and fertilizer sower before the seed bed is prepared; it may be applied with an end-gate lime and fertilizer sower; it may be spread evenly over the manure on the manure spreader; or it may be spread by hand.

A soil improvement program for the farm suggested by Whitson and Richards includes:

1. The use of lime when needed.
2. Look upon the money spent for phosphate as a yearly repair charge for your soil.
3. One-third of the tillable area of the farm should be growing successful legume crops each year.
4. All manure should be carefully handled to save plant food.
5. Plow down green crop materia frequently.

The German Dairy Exposition

In connection with the 36th annua meeting of the Association of Ger man Dairy Experts, an Internationa Exhibition of packages and contain ers for milk and dairy products wil be held in Berlin from August 16 t 20, 1927. The association is offerin prizes for the best type of milk ca and milk bottle, butter tubs, butte packages, and packages for cheese

Manufacturers interested in en tering an exhibit at this show ma secure more complete information b writing the Verbandstag, Des Ver bandes Deutscher Molkereifachleute Berlin, N. 4, Chausseestrasse 8, Ger many.

Effect of Poor Roughage

HOARD'S DAIRYMAN:—With equally s good herds in the beginning of the ew association year as last year, ows in the Glenwood Association of Wisconsin are not producing as well r herds averaging as well as in No- ember last year. The forty-pound st has fallen off 50 per cent.

Most of this is due to the bad fall eather and poor quality roughage. lso cows are not freshening as early the fall as usual. No reason has een found for cows freshening later the fall, but it seems to be preva- nt throughout the entire associa- on and vicinity. The poor quality f the roughage and home grown ains necessitate buying high pro- in concentrates. Other years when e could safely estimate hay at 10 12 lbs., this year weights are be- ween 15 and 20 lbs. This goes to ow that cows are consuming a eat deal more roughage, even when eding a well balanced ration. Some rmers report a poor quality of oats en going as far as selling oats and bstituting bran and changing other eds in the ration somewhat.

Some dairymen predict a run-down ndition of their herds because of or quality roughage. They know at a little extra concentrates will supply the right amount of protein, carbohydrates, and fat, but it will not take the place of good quality roughage or keep down the cost of production.

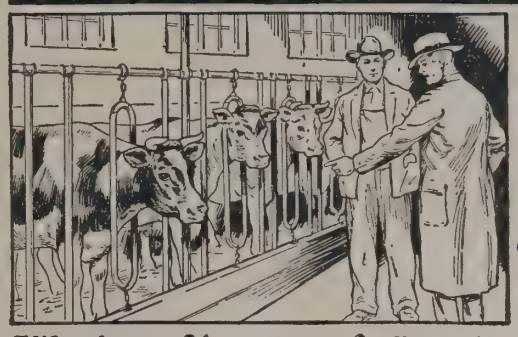
GORDON SCHROEDER, Tester.

Protein Supplements

HOARD'S DAIRYMAN:—In place of oil meal as a supplementary protein feed alone, most members of the Hammond—Baldwin Association of Wisconsin are this year feeding a mixture of gluten feed or meal, cottonseed meal, and oil meal. The difference in price per pound of protein in the different feeds led to this change. By retaining one-third to one-half the amount of oil meal we still have the desirable laxative and tonic effects of oil meal at considerable saving in feed cost. In addition, the variety of proteins in the mixture more nearly supplies the need of high producing cows.

The members of the association have co-operated and made it possible to order a carload of cottonseed meal which will result in an appreciable saving over small lot purchases at local dealers.

The gluten feed contest of last summer served to acquaint many



(Continued on next page)

Why We Know B-K controls live stock disease

What we discovered in our laboratories -thousands of farmers have proved

Here are Typical Experiences

ABORTION

"I am ready to stand back of B-K to the finish. Last year we had about 40 per cent of our cows abort, but we have not had one since we began using B-K."
(Name on request), Lenox, Mass.

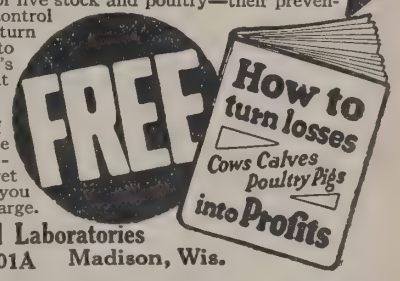
CALF SCOURS

"I had a number of cases of calf scours this summer and in desperation tried B-K. To my surprise in a few days every calf was back to normal."
H. W. Swafford,—, Oregon

RETAINED AFTERBIRTH

"We have got better results from B-K than anything we have ever used for retained afterbirth and calf scours."
J. N. Standfield,—, Ill.

B-K



Everything we say in our farm paper advertising and our bulletins concerning the value of B-K for the prevention and control of disease, is based on facts. We know them to be facts from 15 years of tireless effort, during which we have tested B-K under practical conditions on farms, and in our laboratories.

Our chemists and bacteriologists keep in touch with the leading thought concerning prevention and treatment of live stock and poultry disease.

The word "laboratories" in our corporate name means not only dependable laboratory products made on honor, but services in the form of data, information as to practical, helpful things to improve your conditions. If you will write us what lines of live stock and poultry and how many animals of each kind you are keeping, also your specific troubles, will gladly give you personal attention.

Every Live Stock Owner Should Have This Book

It discusses thoroughly and authoritatively the diseases of live stock and poultry—their prevention and control—how to turn losses into profits. It's a book that embodies our 15 years of experience and research, yet is offered you free of charge.

Prof. Evvard's Inspiring New Book

Prof. Evvard's new book, "Minerals and Feeding," has my unqualified endorsement, and I want to place a copy in the hands of every feeder in America. This book announces new and astonishing advancements in the feeding of livestock. It contains page after page of intensely interesting questions and answers on the vital problem, *how to feed to increase production and to insure greater livestock profits with actually less feed and delay*. It gives a wealth of feeding information and is the most complete book on Mineral nutrition ever published.

Information of Priceless Value FREE

Told in simple words. Easy to read. Easy to understand. A book written by Prof. John M. Evvard of Iowa Agricultural Experiment Station, an authority of the highest standing. This book is an exclusive reproduction of a series of remarkable, up-to-the-minute articles recently prepared for the farm press. I want every livestock and poultryman to fill in and mail the following coupon. I will gladly mail this $1.00 book to you absolutely free. Read it carefully. If after reading it you agree with me that it is one of the most timely and valuable books on feeding that you have ever read and you wish to keep the book as a permanent reference, merely send me 25c to help defray the postage and publishing expense. If you do not feel that this valuable book is worth many times the small sum of 25c you may keep it absolutely free with my compliments, for I want every stock feeder to use this book.

JAMES H. MURPHY, President

Guaranteed way
to make dairying pay

YOU give your cows good feed, good care and good quarters. You invest considerable money which you expect to return you a profit in milk and cream.

Are you getting all the milk your feed and care justify? Are your cows giving good returns on your investment?

What makes a good milker?

No cow can do her dead-level best unless her health, appetite, digestion and elimination are right. These four things are important above all others. That is why simply feeding a cow and taking good care of her are not enough to insure heavy milk production.

Dr. Hess Improved Stock Tonic keeps cows at the peak of their production

Dr. Hess Improved Stock Tonic is exactly what a cow needs to enable her to get the most good from her feed—to produce the most milk.

It contains laxatives for the bowels and diuretics for the kidneys—because proper elimination is essential to heavy milk production. It contains tonics that increase appetite and correctives to promote digestion. For the more a cow eats the more raw material she has to convert into milk—provided her digestion functions thoroughly.

Dr. Hess Improved Stock Tonic is especially rich in minerals, valuable essentials in the diet of milk-producing animals. It embodies calcium carbonate, itself an important constituent of milk. Calcium phosphate, a bone and tissue builder. Potassium iodide, which is essential to the proper functioning of the glands. It prevents calves being born with goiter and contributes materially to stronger, healthier offspring.

Dr. Hess Improved Stock Tonic is real health insurance for the dairy herd. It materially reduces the losses resulting from garget, retained afterbirth, metritis and in getting the cow again in calf.

We guarantee that Dr. Hess Improved Stock Tonic will pay you a real cash profit

This is our unqualified offer: Get a supply of Dr. Hess Improved Stock Tonic from your dealer—25 pounds for every 5 cows. Feed it to your cows for thirty days to prove its worth.

Notice how it whets the appetite! See them consume their ration with a relish. No going off feed—that means you will get a greater and a more even production of milk.

If Dr. Hess Improved Stock Tonic does not pay you, and pay you well, return the empty container to the dealer and get your money back. He will gladly refund it for he knows that we will reimburse him without question.

This is the strongest, fairest guarantee ever made on any product. You can be sure that we could never afford to give it if Dr. Hess Stock Tonic did not produce real cash-money results that you, yourself, can see.

Dr. Hess & Clark, Inc., Ashland, Ohio

Dr. Hess Stock Tonic
Improved!

members with this feed and now it is quite commonly used where formerly it was practically unheard of. We find it especially useful for cows that are not fond of oil meal and in herds where we have had trouble with cows going off feed. Most of these cows take to gluten meal readily and seem to stand it better, due, I think, to the lower fat content of the gluten meal. OSCAR BERKSETH, Tester.

Too Much Emphasis on Records

HOARD'S DAIRYMAN:—With the experience I've had in testing and what I've seen of other associations, more emphasis has been put on reporting high production cows and herds than reports of improvement. I am led to believe that more than 75 per cent of the high production records were being made by these dairymen before they joined the cow testing association.

Cow testing associations are for the purpose of helping the dairyman to make a greater net profit. This must come through more intelligent breeding and feeding. I feel that reports should contain such material as:

1. Number of members changed from a poor ration to a practical, balanced ration.
2. Number showing any improvement in feeding.
3. Number feeding individually and according to production.
4. Lowest cost per 100 lbs. of milk.
5. Lowest cost per 1 lb. of butterfat.
6. Lowest average feed cost per cow in association.

These might be arranged on the basis of a scoring system and submitted to testers. I believe this system would help bring about better results.

Indiana. M. C. SNEDEKER, Tester.

One of the primary reasons for changing the type of reporting cow testing association news in Hoard's Dairyman was the very reason that is brought out in this letter. We feel that altogether too much emphasis is being placed on high records in cow testing association work rather than the real and fundamental purpose of this work. However, there are always two things to be considered in publicity, one of which is to engage the interest of people and the other to teach a lesson. High records seem to be of interest to many, and for this reason it seemed wise to maintain the tabular statement as to records. We hope that the narrative reports will bring out the specific lessons and other interesting items that will really make the cow testing page of larger value and interest to our readers.

It has been something of a regret to us that testers, generally, have not understood the purpose of the narrative report in supplying us with this type of material. A cow tester on his daily rounds runs into many things that would be of interest if he would only jot them down and carry them forward to us.

It may be that some member has developed a unique system of feeding or handling his cows that has worked satisfactorily. Possibly he ensiled his corn without tramping, with the result of either good or poor silage. Maybe he has ensiled mangels with his corn, or in an emergency has substituted one feeding crop for another. Calves, horses, crops, equipment, and other developments may tell a story of success or failure that is worth more and is of greater interest to others than the fact that John Smith had a cow that produced 76.48 pounds fat last month, interesting as this accomplishment may be to Mr. Smith and one in which he takes well deserved pride. Then, too, do not neglect report of improvements and conveniences in testing that would be of value and interest to the hundreds of other testers throughout the United States.

The report on the costs of production, as suggested by Mr. Snedeker must be used with discretion. Prices of feed vary widely, as will be noted by reference to our market page. Comparison between associations and between cows on this basis are not valuable unless the same basic prices are used and the comparison is logical. In the West cows will be properly charged with alfalfa hay at six to eight dollars a ton, while in the East the proper charge may be three or four times this. Low production costs are what all of us are seeking, but how they are secured is what we want and need to learn. Then, too, as in feeding cows, palatability as well as quality is essential. The story must be told so the other man will want to read it.

Appreciation of Tester

HOARD'S DAIRYMAN:—The country of Denmark is noted for its dairying and its co-operation. The sons and daughters of Denmark, who have come to Brown County, Wisconsin and settled around the village of Denmark, this county, are imbued with the same spirit of co-operation and the same efficient dairy requisites as their forefathers. Five years ago a cow testing association was organized in that vicinity. The association was reorganized for its sixth year. Five of the original members have signed up for the sixth time. All but two of the members in this association live in the township of New Denmark. This year's average for the association is 325 pounds of butterfat per cow. Mr. Peter Erickson who owns a herd of 20 grade Holsteins and who has been in the association since its organization increased his butterfat 98 pounds per cow during the five years. This increased production means practically $1000 more which he is receiving from his herd than he was receiving five years ago.

The success of this association is due largely to the efficient tester who has worked in this association since its organization. This man, Mannin Nelson, one of the best testers in Wisconsin, eats, drinks, and sleeps with the thought in mind of improving the herds in his association. In appreciation of his faithful service the Denmark Cow Testing Association held a surprise party in his honor. About 150 men, women, and children were present at this meeting.

J. N. KAVANAUGH, County Agent.

Silage From Frozen Corn

HOARD'S DAIRYMAN:—In the territory covered by the Endeavor Association of Wisconsin, silage from silos filled before the first frost shows a vast superiority over that from those filled later. Next in quality silage came silos filled with frosted corn that was moistened and well packed. Both had the typical silage smell and sufficient moisture. The typical silage odor indicates the right kind of fermentation has taken place and the right amount of moisture kept out the air and created the necessary condition for favorable bacteria. In the silos filled with dry, frosted corn, the silage spoiled to great depths at the top and around the wall, and there were moldy spots even in the center of the silo. The silage was light in weight and in many cases had a burned smell.

This teaches the lesson that a farmer should not wait to fill at the latest date. W. BODEKER, Tester.

The person who never makes a mistake never makes anything.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Superficial Wounds

A wound may look superficial yet be serious. One time we were asked to examine a sheep that was mysteriously stiff, lame, and sick. It had left the flock, stopped grazing, and lay down most of the time. An internal disease was suspected by the owner, but careful examination disclosed that there was a small punctured wound in the hip and on opening it up a seething mass of maggots was found present. Such conditions are also met with in cattle and may have a most serious effect. The superficial wound attracts flies and they lay their eggs in the exuded blood, serum, or pus; then maggots or screw worms (larvae) develop and at once burrow and live on the inflammatory lymph and even destroy the tissues which then become putrid. The system of the animal may be poisoned by absorption of poisonous or toxic matters generated in such putrid wounds and fatalities occur, unless prompt treatment is given.

The superficial wound commonly is deemed so slight and unimportant or nondangerous that it is given no attention or is merely given a "lick" of pine tar or axle grease. Pine tar is a favorite "smear" with sheepmen and may prove fairly effective, but to help keep flies away it is best to mix with it some crude carbolic acid, oil of tar, or commercial coal-tar dip or disinfectant. It is not suitable for application to ordinary cuts on a cow's teats or udder. Those should at once be washed clean, dried, and well swabbed with a 2 per cent solution of mercurochrome or with tincture of iodine. Then, a salve composed of 1 part of tincture of iodine and 2 parts of vaseline should be applied. If flies annoy, a small quantity of iodoform may be mixed with the ointment, or oil of pennyroyal, oil of citronella, or oil of tar, or a little of a mixture of the three drugs, will serve the purpose. One part of each of them mixed with three parts of oil also makes a good preparation for repelling mosquitoes.

The swabbing may be repeated daily until healthy conditions are established and healing is progressing, but in the superficial cases mentioned one or two applications usually suffice. In districts where tetanus (lockjaw) is prevalent it is best not to apply an ointment or salve, as they exclude air and so favor proliferation of the germs and formation of their toxic elements which cause the disease. In case of a punctured wound of the hoof of a horse which also is sometimes considered superficial or trivial, it is advisable to have the veterinarian give the animal a protective hypodermic injection of tetanus antitoxin. Cattle are much less susceptible to the disease.

Superficial wounds on the body soon heal when wetted several times daily with a lotion composed of 1 ounce each of acetate of lead and powdered alum, 6 drams of sulphate of zinc, and 1 pint of soft water. Label the bottle "poison" and shake it well before use. It must not be applied, however, where the animal can lick it off, or when it may be licked by other cattle, for it is quite poisonous. Do not remove the scab formed by use of the lotion. The lotion is also excellent for barbwire wounds of the skin or harness sores of horses.

The Secretion of Milk

We wonder if it is going to be necessary to revamp the prevailing beliefs as to the method of milk secretion in the cow's udder. It is the common impression, among experts, that most of the milk is elaborated at the time of milking, it being an emulsion of butterfat, casein, sugar, and mineral matter in "water" derived from the blood. Now comes the U. S. Department of Agriculture, with astonishing results of experiments conducted by W. W. Swett, of the Bureau of Dairy Industry, which seem to upset the old ideas relative to milk secretion.

Whereas it has been held that the internal capacity of the cow's udder for the storing of milk is not more than half a pint to each quarter, the report referred to asserts that tests disclose that the udder is capable of holding from 11 to 20 quarts of milk, instead of but 1 quart. This was determined by immediately removing the udders of 2 cows, killed for the purpose, mounting the udders on a suitable framework and milking them clean.

One of the cows had normally been giving 12 pounds at a milking. A total of 10.27 pounds of milk was drawn from her udder after all body connections had been severed, "showing that more than 85 per cent of her production was stored in her udder at the time she was slaughtered." The postmortem milking of the second cow yielded practically 50 per cent of her normal production. "In her case milking was more difficult and all the milk was not drawn, as was shown by the considerable quantity which gushed forth when the udder was later cut open." Mr. Swett further states that it is not uncommon to be able to inject the equivalent of 3 to 5 gallons of milk into the detached udder, the amount depending upon the different characteristics of various udders. The experimenter does not consider his few tests conclusive, but thinks that they indicate that milk secretion is, to a considerable extent, a continuous process, and that a large proportion of the milk secured at any milking is collected and stored within the mammary gland before milking is commenced; also that "the liberation of the milk from the gland is not dependent either upon a nervous or mechanical stimulation or upon internal muscular contraction, since all body connections had been severed before the post-mortem milking was performed."

The writer has often instantly removed the udder after a cow's death and cut into it to determine the amount of milk it contained, but has never tried the post-mortem milking process here mentioned. On the basis of what we have determined by the cutting process we have, for years, stated in lectures and writing that the udder, before milking, is capable of containing several quarts of milk, but we have likewise held that most of the secretion occurred during the act of milking. We have also believed, and yet contend, that milk secretion is controlled by the sympathetic nerve system, in close association with the cerebro-spinal nerve system, and is not under control of the will of the cow; hence that a cow cannot wilfully "hold up" her milk.

Definite proof and conclusions on the subject will be awaited with interest.

Drying Up Cows

HOARD'S DAIRYMAN:—Regarding "Drying Up Cow" on page 527 of the May 10, 1926, issue, I feel as though it would be a crime to be silent on this matter, knowing, as I do, that

(Continued on next page)

Healthy Teats and Udder

The easy milker is usually the profitable milker. Much of the holding back of milk is due to lack of care of the udder and teats. It pays to go after the extra quarts by giving constant care to even the "little" hurts that make the cow nervous and restless.

Bag Balm has a permanent place in thousands of cow barns, because it keeps the delicate udder and teat tissues free from Caked Bag, Bunches, Inflammation, cuts, bruises, chaps, cracked teats, etc. All sores or congestion are quickly eliminated by this great penetrating, healing ointment. Most troubles are healed by Bag Balm between milkings—it acts like magic.

Bag Balm is clean and pleasant to use. Nothing in it to taint the milk; it penetrates at once to the injured part and restores the tissues to normal. A wonderful healer for any sort of skin trouble or animal sore—hundreds of uses on the farm.

Big 10-ounce can, only 60c at feed dealers, general stores and druggists. If your dealer is not supplied, order from us. Ask for free booklet, "Dairy Wrinkles."

Make a note now to put Bag Balm on the job of keeping your cows milking easily and liberally. It pays its cost every day in the average dairy.

DAIRY ASSOCIATION CO., Inc., Lyndonville, Vt.

Wonder Healing Compound FOR MAN or BEAST

—It's CORONA WOOL FAT

Soothing Healing Ointment That Works Like Magic

Corona Wool Fat is made from the oil extracted from sheep's wool. It's different from any salve or ointment you ever tried. It heals and soothes, but will not smart or blister the most sensitive wound. It has healed thousands of stubborn wounds where other lotions have failed.

Hardly a day passes but what you'll find some use for Corona. For sore shoulders, sore necks, collar boils, split hoofs, scratches, sore teats on cows, caked udders, cuts, wounds, burns of any kind on man or beast it is unequalled.

LIBERAL SAMPLE FREE Corona is sold by nearly all druggists or direct from us on receipt of price—8 oz. tins 65c, 20 oz. tins $1.25, postpaid. If you will send your name and address, we'll mail you a liberal sample and book of uses Free. We want you to see for yourself the wonderful healing properties of Corona.

CORONA MFG. CO., 416 Corona Bldg., Kenton, O. [6]

EXTRA MILK
—try this simple plan!

IT is a fact! Seven cows in ten are capable of giving far more milk than they do—in the winter months. Malnutrition—the bane of human health and well-being—is far more common in cows than in people. It is the biggest leak in winter dairy profits. Under the urgent strain of consuming and converting quantities of dry, coarse feeds into milk, the digestion and assimilation break down. The cow may *appear* healthy, but the milk fails to come in paying volume. Quantities of high-priced feed go to waste.

The remedy is simple—and amazingly inexpensive. Help the milk-making organs meet the added burdens thrust upon them. Build new vigor into the digestion and assimilation—milk profits simply MUST result.

Kow-Kare is doing just this job for added thousands of cow owners every year. Instead of just cramming feed into their cows these dairymen are helping their cows keep the milk-making process going full-speed. Kow-Kare has a marvelous tonic, strengthening effect on the productive organs — makes them function actively, produce maximum milk flow and resist disease. Kow-Kare, fed sparingly, but regularly with the feed will put your "poor milkers" back in the profit column. Try it; a single can of Kow-Kare will ration one cow from one to two months, the treatment being regulated by the cow's general condition. It's a little investment, with big—and certain—results.

For Cow Diseases

In treating Barrenness, Retained Afterbirth, Abortion, Bunches, Scours, Lost Appetite, etc., Kow-Kare has a well-earned 30-year reputation of bringing cows back to health and production. It goes to the source of the trouble—makes the affected organs regain vigorous health—resist disease.

For cows at calving Kow-Kare, fed before and after, prevents expensive troubles, makes cow and calf healthy and vigorous.

Feed dealers, general stores, druggists have Kow-Kare—$1.25 and 65c sizes. (Six large cans, $6.25.) Full directions on can. Mail orders sent postpaid if your dealer is not supplied. Our valuable free book on cow diseases sent free, on request.

DAIRY ASSOCIATION CO., INC., LYNDONVILLE, VT.

KOW-KARE
Famous Conditioner of Milch Cows

FOR INFLAMED JOINTS

Absorbine will reduce inflamed, swollen joints, sprains, bruises, soft bunches. Quickly heals boils, poll evil, quittor, fistula and infected sores. Will not blister or remove hair. You can work horse while using. $2.50 at druggists, or postpaid. Send for book 7-S free.

MOORE BROS., Dept. H, ALBANY, N. Y.

your paper goes into every civilized country on the globe. I do not know who is responsible for the article but certainly no qualified veterinarian.

The article mentions leaving a little milk in the udder. This has not the least tendency to diminish secretion but is the best means of producing mammitis or garget. My advice is to milk the cow dry; then there will not be any thick milk even if she goes two days. It is always best to commence by missing one milking, then two milkings, then three, and so on; but in all cases milk her good and dry. If thick milk accumulates once, the udder is hot and feverish and it will take several regular milkings to get it right.

Please pardon me for calling you down on this matter, but it was simply unavoidable on my part as I feel it is my whole duty to do so and I am certain any qualified veterinarian will bear me out.

My best wishes to you and your most worthy paper.

Australia. J. R. C. JONES.

[EDITOR'S NOTE:—There are, evidently, different opinions concerning the proper way of drying up a cow. We would be pleased to have contributions from our readers describing their methods of handling a cow when it is time for her to go dry. We may not be able to publish all that we receive, but we will use enough to give a complete list of the several practices followed.]

Determining Pregnancy

Is it possible for a farmer to be able to determine if a cow is with calf two months after service? The veterinarian I employ can do that, but his charge is so high, it is a luxury to have him. I wondered if I could learn the art myself. Are there reliable books to be had on the subject?

Western Springs, Ill. S. G. M.

The cow's fetus when two months old is only two or three inches long. At that stage of pregnancy it is practically impossible to determine presence of the fetus by feeling through the wall of the rectum or vagina. An experienced veterinarian can make the determination later, in that way, but that would not be possible for the layman. When a cow or heifer that has been coming in heat at regular intervals of 21 days fails to do so after being bred it may, as a rule, safely be concluded that she has conceived. In the heifer the udder then gradually increases in size. The pregnant animal also becomes more quiet and after five months it is possible to feel the fetus through the rectal wall, or abdominal wall, and the abdomen also noticeably enlarges. Veterinary Obstetrics by Flemming, published by William R. Jenkins, New York, gives full information on such subjects.

Cowpox

Please give me a remedy for cowpox. I have quite a bit of trouble with cowpox in my herd. I have one cow that has been infected with this disease for 6 months and seems I can't get any remedy that will cure it.

Fredonia, Ky. J. B. R.

True cowpox should run its course in about 20 days. The papules of cowpox, on the teats, are oval in shape, have concave or dented tops with the lymph contained in several compartments, and are surrounded by a purplish ring or zone. When the crusts fall off, a pock-mark remains for some time. Successive crops of papules tend to form on different parts of the teats. In false cowpox, due to infection of abrasions or lacerations of the skin of the teats, by filth from the stable floor, yard, or milker's hands, sores form, discharge pus, and often turn into ulcers containing dead (necrotic) tissue. The characteristic symptoms of cowpox are absent. Isolate the cow. Cleanse the sores and scrape away necrotic tissue; then swab them with a 2 per cent solution of mercurochrome. Afterward apply a mixture of 1 part of tincture of iodine and 2 parts of vaseline. Repeat the treatment daily as long as necessary.

Mammary Tumor

I am writing you to know what to do for a seven-year-old Holstein cow we have. We use a milker and a couple months ago a lump about the size of a hen's egg formed down in one quarter of this cow's udder. This is not hard yet. It don't go down any or get any larger. This begins on the back side of the quarter and feels like another teat started but did not develop and comes where the teat cup of the milker rubs it when milking her. This is one of our good cows and what should I do to overcome this trouble. She is not giving near the milk out of this quarter she should. We have been milking her by hand the last six weeks.

Saxton, Mo. J. S.

As tuberculosis is a possible cause of such a tumor you should have the cow tested with tuberculin, if that has not recently been done. Tuberculosis is incurable and contagious so that an affected cow has to be disposed of in the manner prescribed by state law. It is even more probable that mastitis (garget) has caused formation of the tumor or mass of scar tissue. That is also incurable when established. Isolate the cow and rub some iodine ointment into the affected part 2 or 3 times a week. We think it likely, however, that the cow will have to be fitted for the butcher.

Abortion Infection

I have been having lots of trouble with contagious abortion in my cattle for the last two years. Now I have sold them all off. How soon can I safely restock and how shall I disinfect my barns? Would there be any danger in using a wood pasture after laying idle all winter?

Switz City, Ind. E. G.

Perfectly cleanse the stables after removing loose trash. Then saturate every part of the stable with a mixture of 1 part of compound creosote solution and 30 parts of water. Afterward apply freshly made limewash, including the floors and gutters. New cattle may then be introduced. The wood pasture should be safe after a winter's exposure to frost and snow.

Caked Udder

Would you recommend the use of camphorated oil on udders caked or slightly caked at freshening time?

Cape Girardeau, Mo. A. H. M.

As camphor tends to lessen milk secretion it is better to rub in a mixture of 1 part each of turpentine and fluid extract of poke root and 8 parts of lanolin (sheep's wool fat) or lard in cases such as you mention. Do that night and morning and also massage the udder at noon without applying the ointment at that time.

if your horse

has a cough or cold or has been exposed to disease give it Spohn's. Use Spohn's to keep your horses working full time. For distemper, influenza, colds, coughs, pink eye, catarrhal fever and all diseases affecting the nose, throat and lungs.

Doctor Recommends This Tobacco to Pipe-Smoking Patients

His own happy experience with this particular tobacco led him to recommend it to others

There seems to be an unwritten law among pipe-smokers. When one man discovers a way to get more enjoyment out of his pipe, he feels obligated to tell the "pipe-smoking fraternity" about it.

So it is not surprising that when Doctor Gardiner of Florida found a tobacco that really enabled him to enjoy a pipe for the first time, he made a point of recommending it to all his pipe-smoking patients.

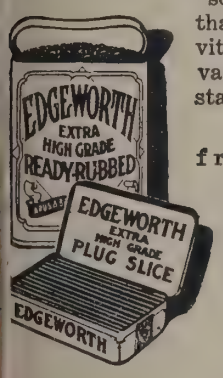
You'll find his letter interesting.

Larus & Bro. Co.,
Richmond, Va.

Dear Sirs:

No harm done, I hope, if I feel like I want to say a word of praise for Edgeworth Ready-Rubbed.

I have tried many kinds of tobacco in a pipe, but until I got to smoking Edgeworth I never really enjoyed a pipe.



Frequently I say to patients who must smoke: "If you're going to smoke your pipe, use Edgeworth."

I like it and recommend it wholeheartedly to anyone who enjoys smoking.

Yours truly,
W. D. Gardiner, D. O.

There seems to be something about Edgeworth that gives a degree of smoking satisfaction that a man simply can't keep secret. He wants to "tell the world" about it—once he has discovered it for himself.

Of course, until you try Edgeworth, you won't know what this "something" is. For that reason we invite you to take advantage of our standing offer.

Let us send you free samples of Edgeworth so that you may put it to the pipe test. If you like the samples, you'll like Edgeworth wherever and whenever you buy it, for it never changes in quality.

Write your name and address to Larus & Brother Company, 15-M S. 21st Street, Richmond, Va.

We'll be grateful for the name and address of your tobacco dealer too, if you care to add them.

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Edgeworth Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound, and also in several handy in-between sizes.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one- or two-dozen carton of any size of Edgeworth Plug Slice or Edgeworth Ready-Rubbed at the same price you would pay the jobber.

On your radio—tune in on WRVA, Richmond, Va. —the Edgeworth Station. Wave length 256 meters.

Minerals, Molasses, Kafir Fodder

What per cent of steamed bone meal do you recommend in a ration for dairy cows? What per cent of limestone, if any, and in what form? How much cane molasses should I add to each 100 lbs. of cut kafir fodder? I have kafir fodder in bundles and want to run this through a cutter adding the molasses so cows will relish it better than if fed dry.

Kerrville, Texas. B. L. W.

Not enough is known about the lime or other mineral requirements of cows to permit one to prescribe a definite per cent in the ration. Rations may be supplemented with minerals in three ways. Some manufacturers of mixed feeds are now offering feeds in which certain mineral substances have been incorporated. These substances are usually bone meal, finely ground limestone or other form of calcium carbonate, and salt. These substances are usually added in the proportion of 20 lbs. of each to 1,940 lbs. of mixed feed. Another way to supply these is to mix them in equal parts by weight and allow the cows free access to the mixture or, if the cows are stanchioned continuously, 3 to 4 ounces of the mixture are fed daily with the concentrates to each cow. A third way to supplement the ration is with a mineral mixture compounded by a reliable manufacturer and fed according to directions.

The need for supplying minerals to cows depends very much on the character of the roughage fed and on whether cows are low, medium, or high producers. For example, a low producing cow fed a ration that includes all the legume hay she cares to eat is not so likely to need additional minerals to supply her requirements. On the other hand, a high producing cow fed a ration including silage and corn stover would need additional minerals, particularly calcium or lime, in addition to which she would need a rest period of 6 to 8 weeks during which time she must be liberally fed in order that she may recover any depletion in minerals that may have been used during the peak of her lactation period. Medium producing cows, those producing up to 300 lbs. of fat a year, will, if fed liberally of legume hay and given 6 to 8 weeks rest plus liberal feeding during this time, likely not need much additional mineral substance. As a matter of safety, however, it is considered good practice to give cows of this kind some additional mineral.

The amount of cane molasses to add to 100 lbs. of cut kafir fodder will be determined partly by the way in which the dry fodder takes up the molasses. One would not want to make the mixture too sticky because of difficulty in handling it. Again one would not want to add so much molasses as to make it difficult to balance the ration. Both feeds, molasses and kafir fodder, are low in protein and require considerable of protein to balance the ration. If a legume hay were fed with the molasses—kafir mixture, less of high protein concentrates need be fed. The price of the molasses in relation to prices of other carbonaceous concentrates like corn, hominy feed, kafir grain, and such like should be considered. If one should add 15 lbs. of molasses to 100 lbs. of the dry cut fodder, the feeding of 20 lbs. of this mixture would include 2.6 lbs. of molasses; 25 lbs. of molasses to 100 lbs. of fodder would give 4 lbs. in a feed of 20 lbs. daily. Four pounds of cane molasses per head daily is not considered too heavy feeding of this feed, but it might be more than is profitable to use.

Are You Buying Hay?

(Continued from page 5)

cago, and at other important hay markets. The federal grades are definite and are interpreted in the same way at all markets by men who have been carefully trained for the work and who are continually under supervision to see that the grading is carefully, impartially, and correctly done.

As soon as hay producers and consumers become familiar with the federal grades and make use of the local inspection system, haymarketing should become less expensive and more satisfactory. Local inspection by qualified inspectors should help to develop direct shipments from producing centers to consumers. Local inspection should help to avoid disputes between both shippers and buyers. If a shipper gets an order for an inspected carload of "U. S. No. 1 alfalfa" and fills a car with hay which the local inspector grades as "No. 1 alfalfa," he is protected to the extent that the man who gets the hay cannot refuse the hay on the claim that it is not up to grade. On the other hand, when a buyer some distance away orders a car of "U. S. No. 1 alfalfa," he can be quite sure that the car will be of that grade and not filled with less desirable hay. Hay growers, dealers, and consumers should find when the federal grades are generally known and adopted that hay marketing will be better standardized and more satisfactory.

Fortunes made in no time are like shirts made in no time; it's ten to one if they hang long together.—Douglas Jerrold.

"A Thing of Beauty is a Joy Forever"

This typical Ayrshire cow picture, 11"x14", in colors, suitable for framing mailed free.

It doesn't matter whether it is a favorite old tree on the farm, a sparkling jewel, or a herd of cows in the barn yard; there is everlasting joy in things of beauty.

Since before the poet wrote the above line more than a century ago, Ayrshire breeders have recognized the "joy forever" in producing cattle of unrivalled beauty. Style, straight backs, good bodies, level udders, and ideal proportions have been bred into these hardy creatures for generation after generation. No wonder the Ayrshire is recognized as the dairy cow of perfect type!

But the real reason why Ayrshire beauty is a joy forever is because it is associated with the most liberal and economic milk production.

Booklets describing the breed gladly Mailed Free. Write

Which Breed is the Best?

(Continued from page 8)

own; a bull association can be organized. A local breeders' association brings benefits; benefits which must be measured in more than direct returns. There is encouragement and stimulation in joining together in the promotion of a single breed which the man with "something different" fails to receive. A beginner may wisely be guided in his selection by the results of a "cow census" in his neighborhood.

These several considerations are important to the man who would discover which is the "best cow" for his farm: "which one do you like," "what is your market," "market price of the breeds," and "what do the neighbors own." And of these, the last is by far the most important.

[EDITOR'S NOTE:—This discussion is to be supplemented in succeeding issues of this publication with a series of five articles describing in greater detail the characteristics and history of each of the five major dairy breeds. They will be of interest to the man who is about to make a choice, as also to men who have already made their decision.]

La Crosse County Guernsey Sale

The recent La Crosse County, Wis., Guernsey Breeders' Sale was a record breaker in number of cattle sold and in number of distant buyers. Two hundred eighty-nine head of cattle sold from one o'clock in the afternoon to eleven o'clock in the evening. Buyers were present from nine states, many of the cattle going to California, Pennsylvania, New York, Utah, and New Jersey. It was one of the outstanding sales of the fourteen fall sales held by the Association. One hundred six registered cows, heifers, and bulls were sold in the afternoon.

Forty-five bulls and bull calves sold for an average of $98.

Twenty-three heifers and heifer calves sold for an average of $101.70.

Thirty-eight cows sold for an average of $167.65.

The top bull, a very nice yearling consigned by Richard F. Klemm, sold for $280 to P. A. Larson of Wisconsin. Mr. Klemm also consigned the two top cows, one selling for $360 to Jas. H. Allen of New York and the other for $350 going to Ed. Williams of Utah.

The grade sale started at 7 o'clock in the evening and 183 head sold in four hours. Forty-six heifers and heifer calves averaged $50.20 and 137 cows averaged $118.24.

The top cow, consigned by Herbert Hochmuth, sold for $255 to F. M. Byers of Illinois.

Grahamholm—Mayowood Sale Has $600 Top

The annual Grahamholm—Mayowood sale, held at Rochester, Minn., November 15, afforded an excellent opportunity to Middle West breeders for the purchase at moderate prices of a splendid offering from these well known herds.

The top price of $600 was paid for the yearling, Grahamholm Ceasar Colantha, a very promising son of "Dutch." He went to the bid of The New Mellary Abbey of Iowa. The proved sire, Grahamholm Colantha Johanna Lad, went at the bargain price of $375 to the bid of F. D. Scholljegerdes of Minnesota. He is a bull of splendid type, seven years old and has tested daughters up to 30 lbs. in junior 2-year-old form. The offering averaged well over $200. The top of the females was reached when Ormsby King of Minnesota paid $350 for one of the best young daughters of "Duke." Mr. King took a number of the top females.

The Grahamholm consignment was made up largely of heifers from twelve to twenty months of age. They were daughters of the Grahamholm herd bulls, of good type, and found great favor with the bidders. Several of these went up over $200 with a $250 top.

In spite of wretched weather conditions throughout Southern Minnesota and Northern Iowa for several days before and on the day of sale, the attendance was good and the bidding spirited at all times.

The sale was managed by Melin—Peterson Company, and J. E. Mack and E. J. Hanson did the selling.

As True Today

"Two great obstacles," said W. D. Hoard in an address delivered in 1881, "for a long time stood determinedly in the way of successful dairying in the Northwest. The first was the indifference of the farmers, and the loose, careless habits which a quarter century or more of wheat farming had bred. That obstacle still remains to a certain extent. Dairy farming calls for the best exercise of the intellect. Just in proportion to the enlargement of the judgment and the adoption of thorough methods of business conduct among the farmers in any community, can be marked the growth of dairying. Old methods and old notions yielded stubbornly. But the verdict of outraged nature has been against them. The mute reproach of impoverished fields and lean pocketbooks has been more than human nature could long endure."

An acre of corn put into the silo and then put through cows will produce as much milk as an acre and a quarter of corn fed as dry stover and corn grain. The silo route is the cheaper, too.

If all the Dairy Cows In Iowa Were HOLSTEINS—

On January 1, 1926, there were 1,369,000 dairy cows in Iowa which produced approximately 6,200,000,000 pounds of milk last year at a feed cost of approximately $95,000,000. If all farmers were milking cows that were as productive on the average as the 811 cows (Holsteins) on Iowa state farms operated by the Iowa Board of Control, it would have only taken 617,600 cows to produce this 6,200,000,000 pounds of milk and if they had been as economically fed as the state cows, there would have been a saving of approximately $35,800,000 last year alone.

This statement was made by the Iowa State Secretary of Agriculture, Mr. Mark Thornburg, before the recent joint convention of the Iowa Creamery Buttermakers and the Creamery Managers and Secretaries Associations.

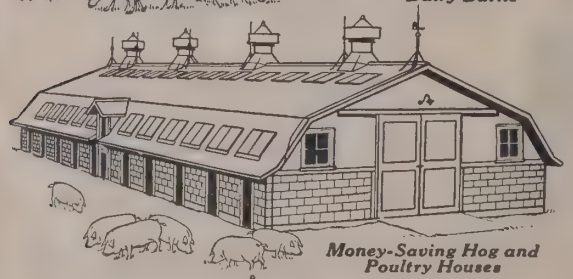
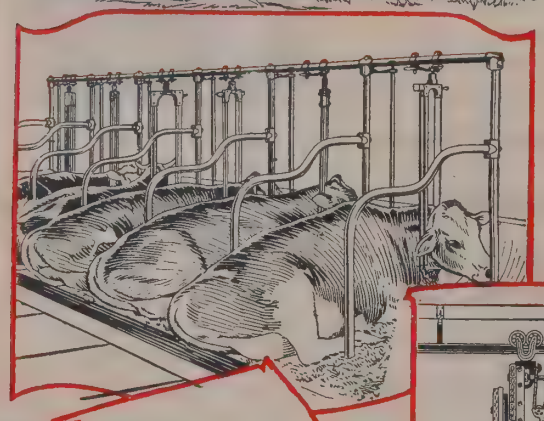
Barn Equipment Book

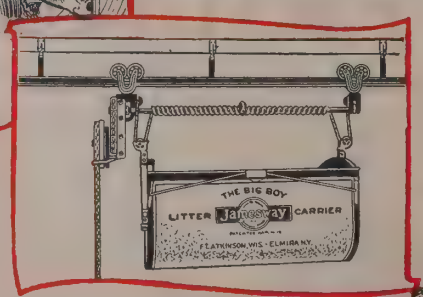
Poultry Equipment Book



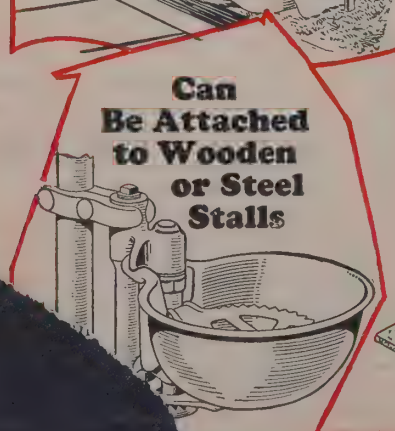
BOTH FREE

W. D. JAMES, Pres.





Labor-Saving Dairy Barns



Money-Saving Hog and Poultry Houses

Can Be Attached to Wooden or Steel Stalls

If you are going to build or remodel a Cow Barn, Poultry House, Horse Barn or Hog House—if you are thinking of putting in Labor Saving Equipment in your present buildings — or installing a Ventilating System — by all means send for these FREE BOOKS before you buy. They will show you how to save a lot of money and help you get started right.

Get the Latest Ideas

How to get the most in farm buildings for the least money is a subject Jamesway has specialized in for years. How you can benefit by these money-saving, money-making plans is told in these Books. Get the latest ideas—benefit by this actual experience and thus avoid costly, annoying mistakes. Profit by the short cuts and save money. These Books tell you how.

It took years of experience to gain the knowledge found only in these practical Books. Over 300 illustrations of Cow and Horse Barns, Poultry and Hog Houses—pictures of the best farm buildings in the land. Two Books packed full of valuable information—send for one or both today.

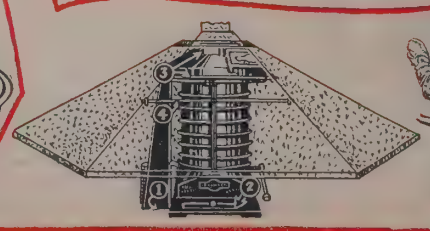
Jamesway Costs Less

By all means let us send you proof that Jamesway Costs Less—that it will pay for itself in a short time and continue to make money for you year after year. It is within easy reach of the man who wants to start in a small way and the RIGHT way. There's nothing better.

These Books tell all about Jamesway Equipment—Stalls, Cups and Carriers for Cow Barns—Hay Racks, Grain Boxes for Horse Barns—Heated Waterers, Mash Feeders, Brooder Stoves for Poultry Men—a full line of Sanitary Steel Equipment for cows, horses, hogs or hens at prices that will save and make you money.

Helpful Aids for Those Who Build

Here are only a few of the many helpful aids found in these books for those who expect to build or remodel:



- —How to save on materials and labor
- —Why specifications get lowest bid
- —Why planning on paper saves money
- —7 essentials of farm buildings
- —How to arrange equipment
- —What is the best wall material
- —What is the best floor material
- —How to pick the right equipment
- —Why walls and ceilings get wet
- —20 pages of Ventilation facts

Why wall construction and heat loss are the two most vital factors in farm building construction.

Mail Coupon Today To Office Nearest You

Just fill out and mail coupon—check items you are interested in and we will send the books you want and full particulars of Jamesway Service. We are the oldest and largest concern in the country specializing in Farm Building Plans, Equipment and Ventilation for Cow, Hog and Hen Farmers. We have saved money for thousands of farmers and we can save money for you, too. Don't build or remodel until you get these valuable books.

Why Jamesway Costs Less

Our extensive experience in designing and building equipment for Cow and Horse Barns, Hog and Poultry Houses, enables us to build BETTER designed—MORE practical—LONGER lasting—MORE Sanitary equipment for the Cow, the Horse, the Hog and the Hen. Being so much better made, they last much longer; being BETTER designed, they do the work better—save you time and labor and give more comfort to your animals. Jamesway Equipment Costs Less because it lasts longer and does the work so much better.

"I have been looking in the dictionary for a word that will express what I think of Jamesway, 'perfect' approaches it. This little paper is not large enough to tell you how pleased I am with my outfit." John B. Scott, Pittsford, Michigan.

"Not only did your cups pay for the equipment but they put a few dollars away every week in the increase in milk checks. I can't say enough for the Jamesway." John Signer, Monroe, Wisconsin

"I have used the Jamesway for nine years. After nine years of service they have done what I expected and I know they will be here for nine years more." Fred Warnberg, Rush City, Minn.

"I ordered Jamesway in 1915—lost everything by fire in 1918 and have Jamesway again and like them best of all." Paul Lytinen, Cloquet, Minn.

"Jamesway is the most dependable labor saving device I have on the farm so far." Alex Turick, Anamoose, N. Dak.

"Just a word in regard to our stanchions purchased in 1909—they are as good as new and have given good satisfaction." W. E. Rabe, Oakdale, Wis.

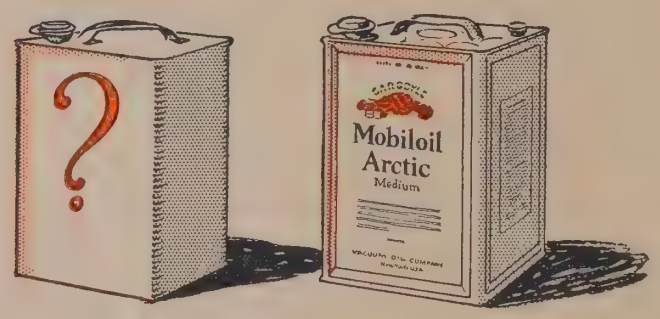
HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING



Volume 72, No. 2 Fort Atkinson, Wisconsin

Rye may look like wheat–*but*–

"Rye is the poorest grain you can try to feed a hen," says a prominent farm paper discussing the substitution of rye for wheat as an ingredient in mixed poultry feed. "It looks so much like wheat that it is often a temptation to try it on poultry. Hens do not like rye until starved into eating it, and as plenty of feed is required by hens that lay many eggs *there is no economy in forcing them to eat a grain they dislike.*"

Many oils may look like Mobiloil–*but*–

Appearance is no guide to low-cost running. Many farmers are tempted to use a cheap oil because it *looks* like Mobiloil. They accept "just oil" and forget that Mobiloil is a *specialized* lubricating oil. And with less than Mobiloil lubrication they get less than Mobiloil protection against wear, repairs, over-heating, and carbon troubles. The correct grade of Mobiloil often cuts oil consumption from 10% to 50%—proving the cheapest oil to use on cost alone.

An unmatched cold-weather record

Make this CHART *your guide*

THE correct grades of Gargoyle Mobiloil for engine lubrication of prominent passenger cars are specified below.

The grades of Gargoyle Mobiloil, indicated below, are Mobiloil "E," Mobiloil Arctic ("Arc"), Mobiloil "A," Mobiloil "BB," and Mobiloil "B."

Follow winter recommendations when temperatures from 32° F (freezing) to 0° F (zero) prevail. Below zero use Gargoyle Mobiloil Arctic (except Ford Cars, use Gargoyle Mobiloil "E").

If your car is not listed below see any Mobiloil dealer for the complete Chart. It recommends the correct grades for all cars, trucks and tractors.

GARGOYLE
Mobiloil
Make the chart your guide

Mobiloil is the favorite oil in Canada, Norway, and Sweden, as well as in the United States. And Mobiloil successfully lubricated Commander Byrd's plane on his historic dash to the North Pole—the outstanding cold-weather lubricating job of all time.

The 42 Mobiloil Engineers have studied the cold-weather operating problems of your car, truck, tractor and other farm engines. Their winter recommendations in the Mobiloil Chart are your scientific guide to low-cost winter operation. 609 makers of automobiles and other automotive equipment approve these recommendations.

If your car is not included in the brief Chart at the left, see the complete Chart at any Mobiloil dealer's. It shows the correct grades for automobiles, tractors, trucks, farm lighting and stationary engines.

Now is a good time to talk to the Mobiloil dealer about your season's requirements of Mobiloil. You make a substantial saving by buying Mobiloil in barrel and half-barrel lots.

Success With Sweet Clover

HOARD'S DAIRYMAN:—We have a five-acre field of sweet clover that has brought wonderful results, and we are well pleased with it as a hay and pasture crop. A year ago we plowed this field and made a good seed bed. Then we spread about four tons of limestone, after which we sowed it to oats and sweet clover.

When we cut the sweet clover it was as high as the oats and it was so heavy it was hard to cure. We got about sixteen loads of hay. The cows

ON THE JUDSON FARM

liked it fine and the young calves would eat it too, but we came to the conclusion that it was not best for young calves as it was too much of a laxative to feed. After cutting the hay we pastured it the rest of the season and this year we got another good crop of hay, and pastured it the rest of the time. We expect to plow this field in the spring and sow to alfalfa which I have heard does well after sweet clover.

We sowed another piece of sweet clover and oats this spring. We did not lime it and it has not done nearly as well, none of it growing over six inches tall all summer. We fertilized some of the soil and we could see that this made a big difference in the growth, so I think a good many soils need both fertilizer and lime. We never had any trouble with bloating from the sweet clover or poisoning from the hay.

Wisconsin. (MRS.) H. L. JUDSON.

A Story of Fads

HOARD'S DAIRYMAN:—The fur farming fad that is going over the country reminds me of other fads that have come and gone during my life. Some of them are still here on a solid foundation while others have been largely abandoned.

I remember when I was a boy a man came to my father and wanted to buy a piece of the farm to establish a bee ranch. After that every one seemingly was talking bees, but the business waned and now only a few have bees. The ones that stuck to it, studied the business, and applied themselves to it, are still in the game and have made good.

Next came Jerseys. I remember the first Jerseys that were shown at our county fair and the remarks made about them: cat-hammed, runts, deer, and baby cows. But it was not long until these same men were paying a hundred dollars or more for these little heifers, and Jerseys were seen everywhere. They produced butter that brought the unheard of price of 25 cents a pound. The short road to wealth was in the milk pail. Creameries were built with the farmers' money, many being promoted by sharpers and their history is well known. Now there are few Jerseys to be seen. Those that stuck studied the business, and their sons are with us still and are wearing good clothes and riding in big cars.

Then came chickens. Every one was talking chickens. Expensive houses sprung up everywhere. The poultry exhibits at our fairs were the largest of all the exhibits, but soon there were wrecks of poultry plants to be seen everywhere. This fad springs up about every so often, but I know men who started in at the beginning that are with it yet and they, too, have paid for their farms and have nice homes and automobiles.

Next came ginseng. These little plantations were seen everywhere and resulted more disastrously than any of the other fads. Now there are none to be seen in my county. The most stable fad with us today is the making of market milk. Herds of Holsteins have taken the Jersey's place and silos are seen on every hand. Will it last? The answer is the same. Those that follow it through thick and thin are the ones that come out on top.

Now there are fur farms springing up around us. Fox and skunk are principal kinds grown. Fifteen hundred dollars is the average price of a silver female. From what I've seen of this industry there are more things to combat than with the other ventures I have enumerated. The fox is a very peculiar animal. They require constant attention and the beginners can soon wreck a fortune with them. Nevertheless, the one that devotes his time to them as the winners in these other fads may come through all right.

My observation has been that, when anything has been hailed as a quick and short road to fortune, it has left many a wreck by the wayside. The trouble has been that a market must be established and the business must be studied. I remember how the eggs were advertised as a cheap and pure food, and the market showed the result. Now milk and butter are the center of the stage and the American people have just awakened to their good qualities. Will every one want a silver fox coat in the future?

Ohio. A. UNDERHILL.

Estafette of Abbeyleix has taken fifth place in class AA by producing 15,127.6 pounds milk and 838.7 pounds fat, testing 5.54 per cent. She also is the new state champion Guernsey in Pennsylvania for that class. She has a former record in class F of 10,466 pounds milk and 610.7 [illegible] fat. Estafette was bred [illegible] Fitzpatrick and made [illegible] der the ownership [illegible] both of Pennsyl[illegible] can Guernsey [illegible]

The McCormick-Deering P & O Little Genius 3-furrow plow is shown here pulled by the sturdy 4-cylinder McCormick-Deering 15-30 Tractor. The little Genius is built in 2, 3, and 4-furrow sizes for tractors of various power ratings.

McCormick-Deering—*the mark of quality manufacture*

THE McCormick-Deering dealer in your community offers you tractors and tractor plows developed by one builder for your satisfaction. The dealer, who is expert in gauging the machine needs of his community, has chosen his stocks from the McCormick-Deering line with your soil, crop, and climatic conditions closely in mind. If you are interested in turning your soil in the shortest possible time and with the smallest expenditure of man labor, we urge you to study the McCormick-Deering combination of power and plows.

McCormick-Deering Tractors are sturdy, modern, 4-cylinder units, built in three types,—10-20 h. p. and 15-30 h. p. regular tractors, and the two-plow Farmall designed for planting and cultivating row crops in addition to doing all regular tractor work. All three embody the same basic 4-cylinder engine design and are built according to Harvester quality standards for long years of economical, labor-saving operation.

McCormick-Deering P & O Tractor Plows—moldboard and disk types—are up-to-the-minute in every detail. Designed to plow with minimum power and to operate with minimum human effort. Power lifts, accessible levers, quick adjustments, easily removable shares, etc., are features.

Ask the local dealer for specific information on tractors and plows for your requirements.

INTERNATIONAL HARVESTER COMPANY
of America (*Incorporated*)
606 So. Michigan Ave. Chicago, Ill.

P & O

For more years than most of us can remember, the name P & O has meant absolute plowing satisfaction. Today, the McCormick-Deering line of tractor plows bearing this name upholds the P & O tradition with incomparable tractor moldboard and disk plows for open field, orchard and vineyard use. Built by the makers of the famous 4-cylinder McCormick Deering Tractors for every kind of soil and power. Also, a complete line of horse-drawn gangs, sulkies, and walking plows.

McCormick-Deering
4-cylinder FARMALL

The new all-purpose tractor for planting and cultivating corn, cotton, and other row crops. Leads the way to real horseless farming.

McCORMICK-DEERING TRACTORS *and* P & O PLOWS

The World thinks well of Buick

EACH NEW YEAR finds Buick still more firmly established in public favor.

Old friends remain, new friends are won by this famous motor car. Brilliant achievement is the basis for this high regard.

Today, Buick has an engine *vibrationless beyond belief*, the century's finest contribution to the pleasure of motoring.

And a score of other exclusive features testify to the never-ceasing search by Buick for the new and better thing. The Sealed Chassis, Vacuum-Cleaned Crankcase and Thermostatic Circulation Control are typical examples.

Buick could not offer so much at so moderate a price, if the world did not buy so many Buicks, and if the savings of great volume were not continually poured back into Buick quality.

Look to leadership for value. Only a very satisfactory motor car could have held first place for nine consecutive years!

BUICK MOTOR COMPANY, FLINT, MICHIGAN

A FAD THAT BECAME A LEADING CROP

'N 1920, 162,820 green on a brown . background; in 1925, 550,645 green on a brown background— ›t green figures on a brown license ate, as you might suspect, but ·een acres of alfalfa on the brown ils of Ontario. This 340 per cent crease in Ontario's alfalfa acreage without doubt the most important ange in the cropping methods that ve been under way on the farms this province during the past five ars.

Ontario eclipses the four northern ates—Michigan, Ohio, Pennsylva-a, and New York, which border it the south, in total acreage devoted alfalfa and in the percentage of nd under alfalfa as compared with e total acreage under tame hay ops. In Pennsylvania but 2.4 per nt of the total acreage under tame ıy in 1925 grew alfalfa; in New ork this percentage was 4.3, in hio it was 5.37, in Michigan it was .1, while in Ontario 15.5% of the tal hay acreage of the province oduced alfalfa. When we consider at only a decade ago the acreage ıder alfalfa in Ontario constituted arcely 2 per cent of the total area ıder hay, the figure for 1925 is sig-ficant of the great awakening inter-t which farmers of this province e showing in this crop.

Many and varied have been the perlatives bestowed upon alfalfa its many admirers. "The wonder ant," "the queen of forage crops," he feed crop supreme," and "the st mortgage lifter" are typical ex-nples of the titles which have been ed by ardent writers encouraging falfa culture, while enthusiastic ag-cultural orators have heaped their aises of its matchless qualities up-farmers' audiences large and

W. C. HOPPER, CANADA

small. The very name alfalfa is Arabic "for the best fodder."

Origin of Alfalfa

Although still new to Ontario and still more or less unknown to many farmers in North America, alfalfa is nevertheless of very ancient origin. Its gradual spread from the country now known as Persia to other parts of Asia, to Europe, and to North America would make a romantic story. It was upon it, doubtless, that the flocks of Abraham fed and when David in his pastoral psalm referred to the "green pastures" in which his flocks were made to lie down, in all probability he referred to the rich alfalfa so common to that eastern land. From its original Asiatic home it spread north and northeast through Siberia. It crossed the Arctic Circle and pushed its way eastward into Thibet, Mongolia, and China. It came west into Greece and reached Italy from Greece in the first century B. C. From Italy it came westward into Spain and then north into France where it was given the name "lucerne." The Spaniards brought it to Central and South America in the sixteenth century and to California about 1854 and left in it one of the most valuable of all contributions to the wealth of this western hemisphere.

Excellent Qualities of the Plant

Alfalfa's superiority as a hay crop is conceded by all. In yield per acre, in palatability, and in feeding value it is unsurpassed by any other crop grown for hay in Ontario. The average yield of other hay on Ontario farms is but 1.5 tons per acre, while alfalfa averages 2.75 tons and yields of 4 and 5 tons per acre are quite usual. Alfalfa's deep root system which imparts to the plant the ability to withstand drought, the winter hardiness of the variegated varieties which even surpass in this respect the long established legume red clover, the perennial habit of the plant which permits continuous cutting for many years, and the adaptability of alfalfa to such a great variety of soils are further arguments in favor of the growing of this pre-eminent legume crop for the temperate zone. This is the legume which the farmers of Ontario not so long ago smiled at as a fad but which now bids fair to become the leading hay crop of the province.

Under the heading, "Alfalfa the Conquest of the Air," one Ontario writer has rather strikingly observed another cardinal quality of alfalfa. He has disclosed the fact that the conquest of the air as applied to such aeronautic flights as across the Atlantic, around the world, and over the top of the earth, the accounts of which the world has stopped to read, mean less to us than that other conquest of the air of which there are no animated press reports and no current comments but which is nevertheless being silently and mysteriously pursued day by day by such legumes as alfalfa. Our interest in this latter conquest, he believes, should be quickened because it is intimately connected with the food that we eat and the clothing that we wear. Our food is ultimately derived from plants and the most important problem in agriculture today is that of putting nitrogen into growing plants. Nitrogen, that essential plant food found in such a limitless quantity in the atmosphere, which by bacteria associated with alfalfa, in common with other legumes, is brought into a form suitable for plant utilization. The plants, then, in their turn may be converted into substances for the feeding of humanity.

Pioneer Work of Dr. Zavitz

As a student at the Ontario Agricultural College ten years ago, I first became acquainted with the man who has probably done more than any other to encourage the growing of alfalfa in Ontario. The farmers of this province owe a great debt of gratitude to Dr. C. A. Zavitz, professor of field husbandry at the above mentioned institution.

His faith and untiring efforts to introduce this crop on the farms of Ontario have given to him the initial "A" alfalfa, for his second name. His work in the testing of varieties for winter hardiness and yield and the comparisons of rates and dates of seeding which he instituted are now of long standing and the results most valuable. The pioneer work of Dr. Zavitz has gradually expanded until at present time the experimental and extension work with alfalfa now under way by federal and provincial agencies in Ontario is far-reaching and comprehensive.

Ontario Suited to Alfalfa Production

The fertile undulating land of Ontario with natural drainage and so largely well supplied with lime in surface soil or subsoil, the facilities for the making of nitro-culture for seed inoculation, and the suitability of the climate and soil for hardy seed production are features which have

(Continued on page 98)

Hardy home-grown seed has made possible in Ontario abundant alfalfa crops similar to the one pictured above. Windrow and cock curing are both practiced by

THE FEEDING OF DAIRY COWS

No. 7—Herd Management

THUS far our attention has been given to the good ration as a factor in making money from cows. There are other factors that must be considered along with this if a good ration is to serve its best usefulness. Let us call these the factors of management.

What Does It Profit to Put a Good Ration into a Scrub Cow, or Grow Timothy when Alfalfa Could Be Grown, or Allow Cows to Freshen in Poor Condition?

Scrub Cows

Good feeding comes first in cow management. It is unfair to call any cow a scrub because of her low production if she has not been adequately fed. Having given every cow in the herd a fair chance it is then best to cull some cows if any are found that do not make a satisfactory return. This enables the dairyman to send his feed to market through more profitable cows.

The best way to find the poor cows is to be a member of a cow testing association. If one is located so that it is not possible to operate an association, the next best way is to use a milk scale and a record sheet. With these conveniently located in the barn the time for using them is of small concern when compared with the benefits derived.

Most Milk Per Acre

No sooner does a dairyman learn to feed his cows well than he realizes the relation between crop production, good rations, and profit. In other words, he begins to measure milk production in terms of what it brings per acre of crops grown for feeding. When all dairymen do this it will revolutionize the production of milk from the standpoint of economy of production.

Earlier in the series we stated that the basis of a good ration for cows is a succulent feed and a legume hay. We have repeatedly advised dairymen to find out what succulent feed and legume hay they can grow best and then to reorganize their crop rotation sufficiently to produce these feeds in abundance.

A dairyman from Indiana recently wrote in to say that he was paying $32 a ton for alfalfa hay. When one pays this much for roughage he is likely to skimp on the daily allowance. Skimping on roughage and making the deficiency up with higher priced concentrates is not the right way to feed cows.

One of the leading dairy husbandmen in this country has said, "It is doubtful if dairying should be undertaken on a commercial scale where succulent feed of some kind is not available." This means that if one cannot have some kind of silage, roots, soiling crops, or pasture, his cows cannot be made to approach closely their inherited productive capacities.

The same might well be said about the growing of legumes though not, perhaps, to the same degree. Where no legume hay is available the feed cost per 100 lbs. milk is invariably higher.

We repeat that every dairyman should find out what succulent feed and legume hay he can grow best and then set about growing these in quantity sufficient to meet the needs of his

dition at Calving Time

sked a good many suc- what they consid- portant single fac- d rations and in- ences the yearly production of cows. The answer has invariably been to have cows in good condition when they freshen. To go a little farther we do not know a single successful dairyman who does not practice this factor of good management.

This "good condition" does not mean that cows must be fat as for the butcher but it does mean that they be given opportunity to regain at least all that may have been depleted from their bodies during their previous lactation and preferably they should be made to store a reasonable reserve.

There was a time when this practice was somewhat discouraged on the basis of danger from milk fever but the discovery of the air treatment and its intelligent use now make almost a perfect defense against the disease.

If good cows are not in good condition when they freshen they must be excessively fed during the first half of their lactation if their inheritance for producing milk is satisfied and even then it is doubtful if they are made to reach their maximum. Excessive feeding has its danger and many a good cow has been injured because her owner tried to hold her up in flesh or build her up after she calved in poor condition. It is easier, safer, and much more satisfactory to build a cow up when she is dry than to try to do so after she calves.

The important factors in building cows up are the dry or rest period and adequate feeding. Some dairymen excuse a cow's condition on the basis of not being able to dry her up. Other dairymen seem to think that as soon as a cow ceases to give milk her feed should be cut down to mere body maintenance. There are few cows on average practical dairy farms that cannot be dried up 6 to 8 weeks before they are due to calve. Every effort should be made to dry them up and thereafter they should be liberally fed to within a week before they are due to calve.

The feed used to bring cows up to good condition at calving time is a necessary overhead expense in the management of good cows. It is not enough to know how to feed cows when they are in milk; one must also know how to feed them when dry.

Regularity

In visiting many good dairymen we frequently are reminded that regularity in feeding and milking is a part of getting the most milk from cows fed good rations. Putting this in a different way it takes a mighty good salesman to attract the attention of a good dairyman when it's time to feed and milk. With some dairymen it can't be done.

Experimental evidence indicates that regularity of feeding is more important than manner of feeding or regularity of milking though feeding and milking usually are done about the same time.

The question of manner of feeding roughage and grain comes up frequently. There is no definite answer. Most dairymen feed grain before milking and roughage after milking, though it is not likely that any more milk is produced than if the method were reversed. The reason for feeding hay after milking is to avoid creating a dusty atmosphere at the time of milking; the reason for feeding silage or roots afterwards is to make sure no undesirable flavor will be imparted to the milk as is sometimes the case when such feeds are given before milking.

Cow Comfort

A very successful dairyman in Minnesota said to us last summer, "I soon found out a cow could not make milk on cold northwest wind and ice water." A cow's chief function is to convert nutrients of feed into milk but she will divert what nutrients she needs to keep her body before any are used to make milk. There is no satisfactory substitute for comfortable housing. Any neglect in this respect is sure to show up in the nature of increased feed requirement and usually decreased milk.

Convenience

Next to feed, labor is the next cost factor in producing milk. In fact the feed itself represents the labor of crop production and it is principally for this reason we included a discussion of most milk per acre in this article as having a bearing on good rations and profit. But the labor factor does not end with the production of crops for feeding.

If it is important to remove scrub cows from the herd it is also important to improve scrub laborers who care for the herd. If it is important to figure milk production in terms of milk per acre of crops used for feeding it is also important to figure it in terms of milk per unit of man labor used in caring for the herd.

We know a dairyman in Wisconsin who does practically all the work on an 80-acre farm including the feeding, milking, and care of his herd. The total yearly production of the herd is 200,000 lbs. of 3.5 per cent milk. May we suggest right here that each dairyman who reads this figures out how much milk he is getting for a year's labor.

This Wisconsin dairyman makes his head save his heels. There is nothing fancy about the arrangement of his barn but everything there is there for a purpose—in the proper place at the right time. The result is that when this man enters his barn in the morning, at noon, or evening to do the work necessary to caring for the live stock, he makes every lick count, with the result that he does about twice as much work as the average man and does it better and easier.

Disease Control

As a factor of management in getting the fullest use of good rations we cannot emphasize too much that of disease control. In some respects this is the hardest problem to solve because not all diseases can be effectively controlled. This is no reason, however, why every dairyman should not acquaint himself with all the proven methods of disease prevention and practice these continually that his herd might be protected. The two most prevalent diseases are tuberculosis and contagious abortion. They are the most important in an economic sense. Tuberculosis is being rapidly conquered. There is no question but that it can be effectively controlled. Today there is no excuse for feeding good rations to tubercular cows. It would be great good fortune if as much could be said about the control of contagious abortion. The losses from this disease are enormous. The demand for helpful knowledge is far beyond the supply. Progress is being made in understanding the disease and we have every reason to believe it will ultimately be conquered.

The next article will discuss air, water, minerals, and vitamins in their relation to getting the most out of the feeds used.

Helping cows make the best use of good rations is an essential part of good feeding. Following are some of the more important factors that help cows to return greater values for feeds eaten, and help dairymen to get greater returns for their labor:

1. **The elimination of scrub cows.**
2. **Growing a succulent feed and a legume hay.**
3. **Having cows in good condition when they freshen.**
4. **Regularity in feeding and milking.**
5. **Making cows comfortable.**
6. **Having barn and feeds conveniently arranged so that labor may be used efficiently.**
7. **Controlling disease.**

The Rural Mail-man

The man deservin' highest praise
Is not the latest movie craze;
The wrestler who downs them all,
Or man that shines in playin' ball.

The man my songs would celebrate
And glorify in any state
Is he who fills the day with charm
By bringing mail out to the farm.

The rural mail-man tends to biz
No matter what the weather is;
We get our papers just the same
Despite the fickle weather vane.

When old King Borias gets bold
And sends a blast of bitter cold,
The mail-man takes his daily ride
And leaves folks better satisfied.

In drivin' rain, in stingin' sleet,
Through heavy roads or summer's heat,
He braves 'em all; and each day brings
Its special share of ads and things.

Of course, he gets his wage or jack
For thus distributin' his pack,
But things like that, it seems to me,
Ain't reckoned just that way, by gee!

I feel the mail-man represents
A portion of the tax I spent
That crops right out in service now
The same as though I'd bought a cow.

The mail-man is the one who links
The farmer up with other ginks
Through dailies served hot from the pr
Chuck full o' current newsiness.

The farm improved by quite a lot
When someone had a happy thought,
And instituted R. F. D.'s
That never fail to serve and please.

And let us bless the humble man
Who represents his Uncle Sam;
Who takes the same old trip each day
And makes the farmer's life more gay
(Copyrighted 1925). —I. A. Kimbl

Rerodding a B. Franklin Jo

New lighting rods are being installed on St. Paul's cathedral, London, which Benjamin Franklin originally equipped when he was in England. He helped to install the conductors. The original rods of the famous cathedral were iron, and the engineers who are now adjusting copper rods have a fragment of the original iron conductor which Franklin devised.—The Inland Printer.

AYRSHIRE CATTLE IN THE UNITED STATES

TWO hundred years ago in the County of Ayr in Southeastern Scotland, a group of thrifty farmers pursued the breeding of a beautiful and very useful breed of cattle which took their name, Ayrshire, from their place of origin. The excessive moisture, the bitterness of long winters, the rough highland pastures, and the scarcity of grain necessitated that these be rugged, hardy cows that had ability to produce milk profitably under difficult conditions. Doubtless cattle from neighboring countries were used in the formation of the breed, but there is no record of direct foreign importations into Ayr at that time.

BEUCHAN PETER PAN, LEADING ADVANCED REGISTRY AYRSHIRE BULL WITH 54 A. R. DAUGHTERS

Importation and Distribution

Early in the last century Scottish settlers enroute to Canada brought the first Ayrshires to American shores. The first importation to the United States is thought to have been made in 1822 by H. W. Hills of Connecticut. In 1837 it was reported that John P. Cushing of Boston made an important importation and since then importations have been quite regular. There are at present about 30,000 registered Ayrshires and 400,000 grades in the United States. Some herds are to be found in every state, but New York, New England, and Pennsylvania are the strongholds of the breed.

General Characteristics

The Ayrshire has a well built, stocky body, not heavily covered with flesh but giving the appearance of great vigor and vitality. Calves weigh from 60 to 80 pounds at birth. The weight of mature bulls varies from 1,600 to 2,200 pounds while mature cows weigh from 1,000 to 1,600 pounds. The color varies from almost pure white to nearly all cherry red or brown with any combination of these colors. Usually the switch is white. The horns are large and turn gracefully outward, then forward and back, giving a very distinctive appearance to the head.

Ayrshires are noted for their uniform type. Straight tops and well shaped bodies are the rule, and generally the cows carry the most symmetrical udders of any of the breeds.

Below is given the score card for Ayrshire cows, a card which will doubtless be changed by a type committee appointed by the Ayrshire Breeders' Association and now working on that very thing.

A Typical Ayrshire

The Ayrshire Association has done something unique in securing a reproduction of what kind of an Ayrshire cow breeders like. Hundreds of photographs were examined and two were finally selected as being nearest to perfection in production and conformation. Copies of this typical Ayrshire may be secured from the association, as also other literature on the breed.

Production

Ayrshire milk contains a percentage of butterfat that is about the average of all the dairy breeds. The 6,709 cows and heifers that completed official records up to January 1, 1926, produced an average of 10,316 lbs. milk containing 409.99 lbs. butterfat or 3.974% butterfat.

The Ayrshire Breeders' Association is the first breed association in this country to adopt a "herd test" plan for making official records and it is expected that this plan will result in a larger percentage of the cows of the breed being tested than would otherwise be the case. On July 1, 1926, 60 herds with 1,800 cows were on test, with every probability that this number would be doubled within six months.

The two highest butterfat records for the breed are both held by Canadian cows. Briery Lass, owned by the Canadian government, last spring completed a record of 22,035 lbs. milk, 979 lbs. butterfat and in the early summer Nellie Osborne of Elm Shade, owned by W. C. Wylie of Quebec, finished a year's production of 23,223 lbs. milk, 1,003 lbs. fat, the first cow of the breed to cross the 1000-lb. mark.

The ten highest butterfat producers and milk producers among Ayrshires in the United States are listed below:

Ten Highest Butterfat Producers

What I Am Trying To Do On My Farm

In Building a Profitable Dairy Herd

W. J. DOUGAN, WISCONSIN

THERE are three outstanding essential factors in building a profitable dairy herd. The first essential is cows capable of producing. This is so self evident that it seems almost unnecessary to state, yet any number of farmers are trying to se-

MR. DOUGAN WITH MARIE OF SARNIA

cure profits from cows that cannot turn feed into milk. There is a wide difference in cows in this respect, even in cows that are well bred to type and appearance. The average Wisconsin cow gives only 190 lbs. butterfat. The average of the 49,000 cow testing association cows in Wisconsin in 1923 was 273 lbs. Eighteen per cent of the herds average over 300 lbs. butterfat. The highest producing cow gave 839 lbs. fat. Therefore the selection of producing cows is of prime importance.

The second necessity in building a profitable dairy herd is economical feeding. Not always the lowest priced feed is the cheapest. The feed that produces milk at the lowest cost is the economical feed to use.

The third necessity is proper management. Here is a good rule for housing and handling of cows: Keep the cows happy. The late Hon. W. D. Hoard expressed a fine sentiment and gave a good rule in this: "The cow is a mother. Treat her as such."

These three factors in building a profitable dairy herd, viz., good cows, good feed, and good management, are easily stated, but, oh, how difficult to work out in actual practice.

Knowledge is essential and to control these factors we must have complete and continuous records of production. These are absolutely required. What the cow does at the pail is the final criterion of the cow, her feed, and her manager.

There has grown up in the dairy world during the past decade, an institution of marvelous influence and almost unlimited possibilities. It is the foundation of intelligent and progressive dairying—the cow testing association. This is simply a co-operative movement. A group of farmers combine and hire a competent man to come to each of their farms once a month. He weighs and tests the milk from each cow, weighs the feed, and figures out for each cow just what she is doing and what profits she is making over cost of feed. There are over 170 of these associations in Wisconsin with over 78,000 cows under test. The continuous records gained in this way are determining to the dairyman his profitable cows and the unprofitable ones, the economical feed, and the right management.

I will give some facts from my own experience to illustrate these points. I had two cows of my own raising from the same dam but different sires. We will designate these cows by their stable names, F4 and G5. F4, with her first calf in 1920, gave over 7,000 lbs. milk, then increased to over 9,000 lbs. and is still a good producer in the herd. G5 gave only 5,000 lbs. with her first calf, and never got up to 7,000 lbs. She was an unprofitable producer and finally was sent to the block.

D5, a four-year-old cow purchased in 1918, started out as a fair producer, giving around 7,500 lbs. milk. By improving her feed, we found she had splendid capabilities. We brought her up to 9,000, 10,000, and 12,500, lbs. with 591 lbs. fat. F9 is another cow that could tell a similar story. A20, a fine looking grade cow bought in 1914, started in with only 4,000 lbs. milk per year. With the best of feed and care during several years, she never gave over 5,600 lbs. milk per year. The daughters of D5, the good cow, are proving good; the daughters of A20, the poor cow, were poor and there is none of her blood left in the herd.

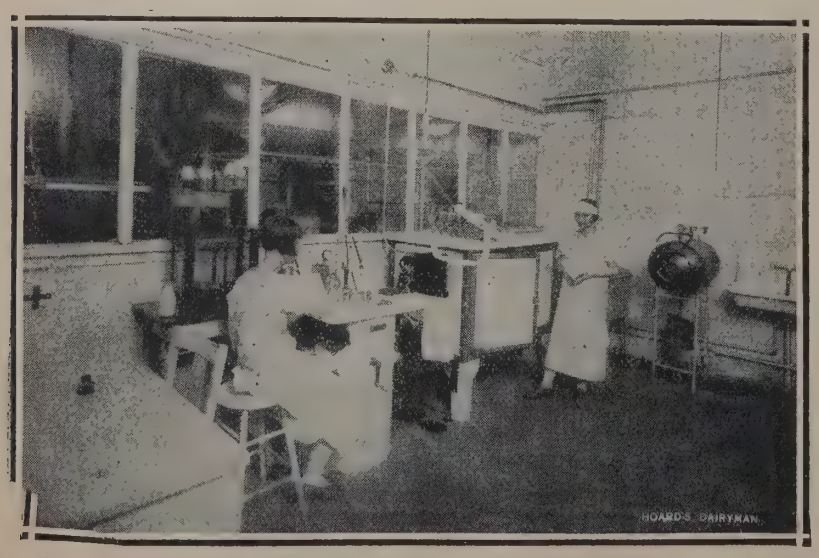
The records of the C. T. A. help me to select sires for building up my herd. The sire is half the herd. The criterion of a valuable sire is whether or not his daughters are as good or better than their dams. With continuous and complete records of production of every cow that comes into my herd, I am able to select prepotent sires to continue in the breeding.

With complete records before me, I can judge the profitable feeds. At one time I was trying to make my cows produce on home-grown mixed clover and timothy hay—mostly timothy. I bought a carload of alfalfa. The increase in milk from feeding alfalfa more than paid the entire cost of the hay. Therefore I could afford to give away my timothy and buy alfalfa at $35.00 per ton and still be ahead.

For some time I thought I could not afford to put in drinking cups in the barn. I had a large tank of good water in the yard. I finally put in the cups. The records showed that this improvement in management paid for the cups in less than sixty days because of the increase in milk.

By keeping careful records and being guided by them in selecting cows, selecting feed, and directing management, I have built up a profitable herd. In 1922 the herd averaged 8,000 lbs. milk, 364 lbs. fat. For several years my herd of over 30 cows has averaged over 300 lbs. fat.

In conclusion, let me emphasize the importance of patience and perseverance. Don't be in too big a hurry to see results. Fix right principles and patiently wait and watch. Don't get discouraged with a few failures. To reach your goal, stick to your breed and your line of dairying. Eternal perseverance along intelligent, sane lines will surely bring results.



A BUNCH OF HEIFERS TO WHOM MR. DOUGAN IS INTRODUCING A BABE

A Texas Co-operative

N. S. IVES, OKLAHOMA

THE Rio Grande Valley is very fertile where it is irrigated, but the irrigated strip is narrow and the population sticks to that strip. The desert on each side is practically uninhabited by humans and totally uninhabited by dairy cattle. It is up to the cows of the irrigated farms along the river to furnish El Paso with milk and butter.

LABORATORY OF THE RIO GRANDE VALLEY DAIRY ASSOCIATION OF EL PASO, TEX., THE LARGEST CO-OPERATIVE DAIRY IN THE SOUTHWEST

There are a number of privately owned dairies in El Paso, and some of them buy milk from the farmers, but back in 1916 a number of the farmers near the city decided to get together in the dairy business and do the milk selling themselves. They formed the Rio Grande Valley Dairy Association, with a capitalization of $2,500. Statistics of the United States Department of Agriculture say the average length of life of co-operative dairies in this country is from seven to ten years. Obviously, 1921 was about the logical time for the Rio Grande Valley Dairy Association to begin to die, but the habit of co-operation, like any other habit, is strong, and there was plenty of room in El Paso for more and better milk. Therefore, the association reorganized in 1921, with a larger capitalization, and added new equipment which would handle the milk more easily and raise the quality of the dairy's products. A new manager was secured in the person of Mr. H. F. Deitrich, a young man with a wide experience in dairying and dairy product marketing.

The association's news sheet says: "A few years ago El Paso was at the bottom of the list of cities of its size as regards quality and handling milk. Today it stands well to the front for cities of its size. The United States has the most carefully guarded milk supply of any country in the world, but this association goes even farther than the law requires. It has installed a laboratory to test all incoming and outgoing products. This laboratory is the first of its kind in Texas, and is devoted exclusively to safeguarding the interests of the consumer."

There is not a year during the past five that major additions and improvements have not been made in plant and equipment. Additional cooling equipment and butter and egg handling machinery have been added which, with other plant improvement, cost close to $10,000 during the first six months of 1926.

Eggs and butter were placed on the market in April, 1926, and with these added to the list the association now offers a complete dairy products service. Graded milk, both pasteurized and raw; whipping cream; condensed milk; table cream; cottage cheese; buttermilk; creamery butter; sweet cream butter; ice cream; and fresh valley eggs now comprise the list of products handled. No other dairy in El Paso,

TRAILING HOLSTEINS TO SOUTH AMERICA

The Daily Log of Their Keeper

JAMES G. BEATTIE, WISCONSIN

DECEMBER 5. Left Wisconsin today with 25 registered Holstein cattle. Destination, Chile. For such an occasion the day was miserable; snow, rain, and sleet falling in turns and continually. The

HIMSELF AT JERSEY CITY

The author in working clothes and risking a smile at the story that the Humming Bird will up anchor at 9 o'clcok "tomorrow."

local freight arrived at 3 p. m. and introduced the flying switch, a timesaver in present day switching operations that at times caused considerable commotion in 665433. At 7 p. m. we are in Sheboygan, waiting to be made up with a stock train for Chicago.

December 6. Daylight broke in Northern Illinois. There was a raw west wind blowing so the doors had to be kept closed to keep it out. Near Chicago a wreck occurred which held us up 6 hours. On the northwest side we were hurriedly delivered to the Indiana Belt to be taken to Blue Island and turned over to the Pennsylvania. And with all sincerity I believe this last ride to be one of the roughest ever to be recorded of land voyage, barring only legitimate wrecks and of known instances where trains have broken through bridges or plunged headlong down precipices.

It was a boxcar temptest attended by plenty of thrills—plenty. Then, at Blue Island, many switch engines took turns showing us around the yards there. When we moved, we collided with boxcars—bigger than ours—and when we stood still others collided with us. The business of hunting a place to put us went on until at last, at 10 p. m., a berth was found in the beef train outbound for New York. Thereafter and until midnight we were let alone, although it was hard to believe. My ears, like the cattle's, grew seismographic straining to detect switch engines, bells, anything that would warn. And when one was heard, it was really amusing to see how everyone got set for a bang.

December 7. Early morning, dark, and in Fort Wayne. I was trying to push back one of these contrary boxcar doors when someone on the opposite side of the train spoke with authority: "Hello, what's going on over there? Eh?" The words were no sooner spoken than the inquisitive had hopped the nearest coupling to find out. Personally, I think this trainman was disappointed not to find burglars.

We have rolled along most of the day over a wondrous stretch of track on the Pennsylvania, reaching to Sandusky, Crestline, and on. Straight as a line, level, and expanses of undulating prairie extending afar on either side. Before arriving at Crestline the train begins to wind with the ruggedness of the country, trailing ancient river beds and circling wooded hills, leaving in its wake a caterpillar of black smoke to mar the serenity of the beautiful day.

In Canton the train was iced and the cattle watered, and a couple of "Roi-Tans" left behind. Quite a sideline this tipping, this appetite for a little extra service, you know. Night begins to fall in Eastern Ohio. The train at 6 p. m. is hurrying through hills and towns, ever voracious for more speed. The doors, old and dilapidated that they are, flop wearily with the motion of the car, the coupling rumble, brakeshoes plead for the oil can, the framework of the car creaks and moans, and one cannot help but wonder what would happen in case a wheel came off. There are four cows to milk, cows that would willingly stand for the operation were it not for the dizzy list of underfoot. The placing of one's feet in jeopardous positions is perhaps the most embarrassing with milking on a train; that, and being taken for a davenport occasionally.

December 8. In the night we went through Pittsburg. This morning we ascended the Appalachian Divide and descended the other side with generous speed, circling the picturesque Horseshoe Bend as we went. In Altoona we stopped and later on in Huntington, where water supplies were replenished and more Roi-Tans disposed of. During the day we followed a river, or rather the river followed us. There was a time in the geography class when I would have known the name of it. But intervening years have been many, years and names of more importance. A random guess suggests the Susquehanna.

December 9. The boss of the chute gang in the Jersey City Stock Yards arrived shortly after we did to say that there were pens, clean and disinfected, waiting for us in the sheephouse. I thanked him and said I was ready to begin unloading immediately; so in a few minutes he returned with his gang and the cattle were soon out of their prisons. They frolicked about like school-kids at recess, delighted with the feel of their feet on terra firma. Many sly eyes have been examining the trunks and equipment in the alley.

"It might not be a bad idea," said the boss, likewise looking at them, "to get that stuff behind a padlock."

He was a little man with black eyes, a big walking stick, an Irish brogue, and experienced apparently with that particular weakness of mankind. So temporarily the rear of a private garage is my boudoir. Word has come that we will move to the ship tomorrow and sail at sundown.

December 10. Word came at 9 a. m. that there would be no moving today. I am told that this is an old tramp freighter we are going on, called the Humming Bird, and that she has internal disorders which hold us up. Went over to New York this afternoon and walked indefinitely, it seemed, on Broadway, West Broadway, toward Bowling Green and around. Window shopping I started in with and window shopping I finished up with. Saw many nice things, which included a gentleman making some rather flirtatious looking waffles. I patronized him and departed with the impression that there is a fellow in Oshkosh who excels.

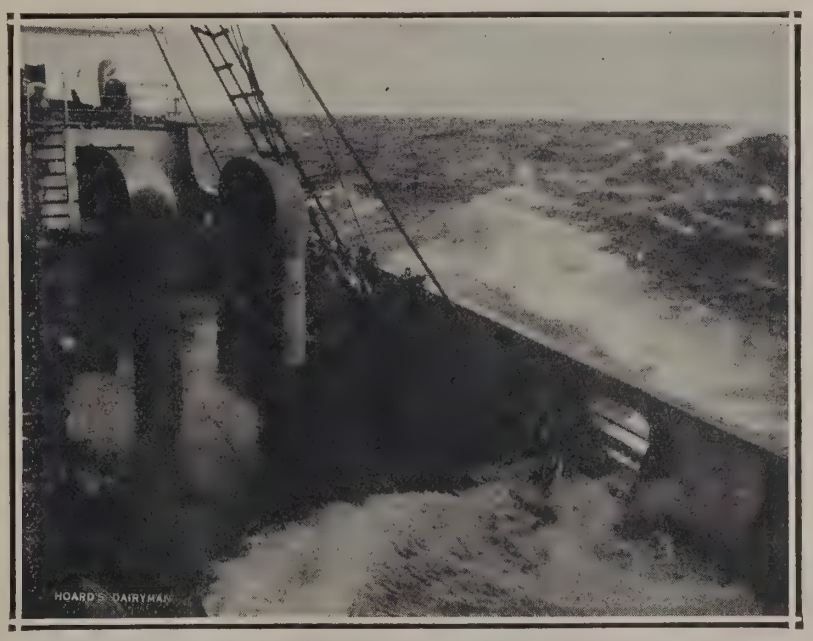
December 11. My departure is postponed another day. The Humming Bird must be receiving a general renovating, as I now hear that the boilers are leaking. A leaky boiler is bad. Firemen as a rule have enough to contend with without them. I went to New York again this afternoon and rubbernecked in with thousands more, gaping and staring in forty different directions. New York is a great place, and one can see plain, as the Frenchman says, how it is that people with portly purses go there.

December 12. Again the instruction that we were to move turned out to be nothing more than a rumor, having no foundation. But I was requested to go to the Customs Office to sign the ship's articles, after which the shipper and I went to Brooklyn to see what was the matter with the Humming Bird. We found her at dock, basking tranquilly under December skies, and hobnobbing with many more of her species. We learned unofficially that she would be ready to sail tomorrow.

December 13. This date could be conveniently left out of anyone's log and the cavity stuffed with sawdust and no one would be the wiser. We were supposed to have moved, but the usual word came about 9 a. m., saying that we would be delayed until tomorrow,—9 a. m. seems to be the time when things go wrong with the Humming Bird.

December 14. It is cold and raw this day, and the wind is moaning round the sashes—signs of a storm. Someone milked the cows during the night. It was convenient for me, but if you could hear the wails of four calves, you would feel like sitting up tonight with a shotgun.

December 15. At noon we loaded on a lighter, said goodbye to Jersey City, and departed for Brooklyn. The pilot did not know where Pier 29 was, so while he was finding out by shouting to various tugs, barges, and other small craft for information, we continued steaming up and down the waterfront. It was a nice ride, but the pleasure of it was impaired considerably by a gale that was desperate to get to its destination.



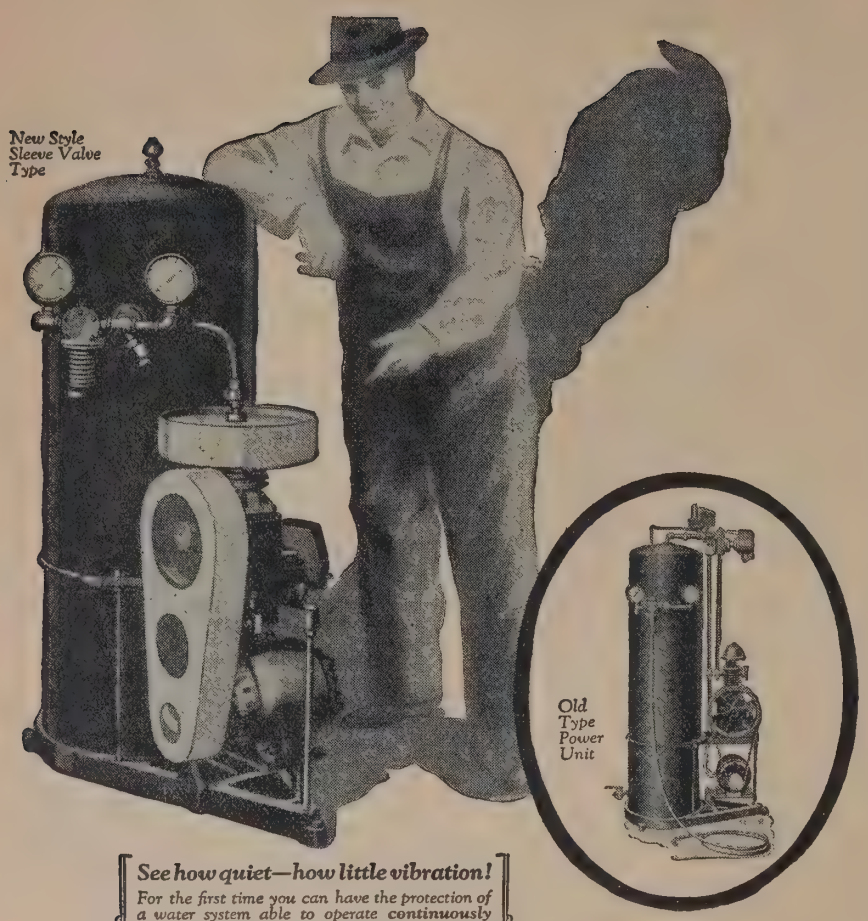
But in the end we found the Humming Bird still at anchor, feathers unruffled, and serene as you please. And tonight General and his tribe are aboard their new home. Everything is strange, which is a situation not new to them. I was shown to my cabin after supper. It is 6'x9', has a built-in settee, bunk, and table with drawers beneath it. Cockroaches, friendly.

December 16. Very little sleep last night as loading crews worked close beside the portholes. It snowed and a fresh wind makes things chilly and disagreeable on deck. The latest is that we will not leave for another day, another leak in the boiler. The cattle have warm blankets around them, but as it is cold and they are on deck and exposed to the weather, they need them. Bade farewell to my shore friends yesterday and the day before that. But some day we will fool them.

December 17. We were pulled away from Pier 29, Brooklyn, at 8 a. m. by a little midget of a tug that looked no bigger than a minute. That tug certainly was plucky, for it clung to the big Humming Bird even though she refused to budge from her mooring. Its persistent effort was an inspiration to gaze on, because it was an excellent example of a little man tackling a mountainous task and finally succeeding. Once clear of the dock and our bow pointed oceanward, the valiant little craft let go its hold, ran away from us as if suddenly released by a spring, saying as it went: "There, helpless creature, shift for yourself."

Under our own power now, the ship began to throb with the labor of its own engine, the water churned about the stern, Old Glory caught a stir in the air and started livening up, and

(Continued on page 104)



A ROUGH SEA BREAKING OVER DECKS OF THE HUMMING BIRD OFF CAPE HATTERAS, VIRGINIA

"The cattle were wet and disconsolate and I was flung into the scuppers as I maneuvered to cross the deck with two pails of water."

Our lighter that on December 15 took the Holsteins from Jersey City to Pier 29 in Brooklyn where the Humming Bird lay at anchor with "cockroaches friendly."

See how quiet—how little vibration!
For the first time you can have the protection of a water system able to operate **continuously** *when necessary, hour after hour. At top speed the water in the freeze-proof cooling pan (necessary only for long runs) scarcely shows a ripple!*

Now—a Better Power Unit as Perfect as Our "O.K." Pump

ALMOST everyone knows about the famous "O.K." National Pump — now 400,000,000 gallons beyond experiment—the pump that has made the National Fresh Water System as dependable as any equipment on the farm. Compressed air, supplied by the power unit, operates it.

While thoroughly successful, the old type power unit is now discarded for something vastly better. Since 1913 our engineers have been seeking it. A patented, sleeve-valve compressor is the secret.

This compressor, the heart of the power unit, is revolutionary in operating principle. *First,* it entirely does away with the troublesome check valve, making air leakage impossible. *Second,* makes the usual unloading valve for starting unnecessary. *Third,* assures easier, quiet running, giving you more water at less power consumption.

Now, when you install a National Fresh Water System, you get:

1. *Dependability* both from pump and power unit.
2. *Fresh water, instantly,* direct from the well to *every* faucet.
3. Also *soft water* from cistern, lake or stream, pumped by the *one* power unit.
4. *Protection against freezing.* No water storage tank or exposed pipes to freeze; no fouling of water in Summer.
5. *Installation convenience.* Put power unit in unheated garage, shed, basement or barn—anywhere within ten feet or ten miles from water supply.
6. *Any lift up to 150 feet.*
7. *Choice of motor-driven or engine-driven power unit.* Capacities, 200 to 2,000 gallons per hour.

These are a few of the reasons why a National Fresh Water System is a good investment on any *farm* or suburban home. Write for free copy of 32-page book, "Fresh Water," which tells the story.

"OK" National Single Cylinder deep well pump. Submerged in water inside of well casing (fits 4, 5 and 6-inch casings). Uses compressed air for power; lifts water 150 feet with strong faucet pressure. No clanking pump rods. Also supplied for shallow submergence in open water.

Necessity for Farm Relief

HON. L. J. DICKINSON, IOWA

IT is encouraging to note that the movement for legislative farm relief has increased in momentum each year and that with the production and marketing of each crop the necessity therefore becomes more apparent. We have admissions from those who contended that there was nothing wrong with agriculture that such is the case. We have admissions from those who contended that the farmer could remedy his own difficulties that such is not possible.

Self-Cure. It is now being admitted by those opposed to legislation to help the farmer that there are too many elements on the outside of the farmers' front gate over which he and his family have no control that absolutely fix the amount of return for each acre of land and that for this reason it is beyond the reach of the individual farmer himself to perfect his own cure. The farmer can practice the greatest efficiency possible without reaching the remedy for his relief.

Co-operative Effort. It is also now admitted that sufficient progress is not being made in co-operative marketing by producers themselves to warrant anyone in concluding that co-operative marketing is a cure for the farmers' economic handicap under existing conditions. The elements that determine his return are beyond the scope and control of such an organization. This principle will work in a minor commodity produced in a limited area, but is not effective in a major commodity produced in an extended area and sold in a world market.

Extent of Farm Depression. The farm depression is not confined to a limited number of states in the Middle West. It is permeating the farm population in every section of the country. Massachusetts is losing its farm population at the rate of 1½% each year and losses in farm mortgages by per cent are found in every section of the country. For this reason the person who attempts an explanation for farm deflation by assuming that it is entirely due to speculation, etc., is entirely wrong.

Business Cycles. In the business world a great deal of discussion is now going on concerning the elimination of the "ups and downs" in business. Leading magazines are discussing the subject. The most dependable business is the one that carries along year after year with a dependable margin of profit, but with no material fluctuations up or down. This is controlled largely by what is known as the modern method of centralization. By this I mean that the business is gradually controlled by a limited number of men in a limited number of organizations. Our legislation has been conducive to such organizations. Most men are today asking the food producer as an individualist to compete with a minutely organized business world. Everyone knows that it is impossible for the farmer so to do.

Bargaining Power. Under present organized business methods the producer of a farm commodity has completely lost his bargaining power. He no longer meets the miller that grinds his flour; he no longer meets the butcher that dresses his meats. He produces his crop as best he can and then delivers it to his market place and accepts what organized business world says he should receive therefore. He has no voice, has no bargaining power, and no one expects that he can survive under such conditions.

Supply and Demand. Supply and demand is another boo-ga-boo often used in argument and but little understood. The farmer now knows that supply and demand have practically nothing to do with the short cycle fluctuations in the price of his product. They may effect the gradual trend of prices from one crop season to another, but have practically nothing to do with the daily, weekly, and sometimes monthly "ups and downs." This old rule has been so abrogated by the organized control of those using and processing the farmers' products that its influence is no longer perceptible except in the long trend of prices.

Canned Corn. The best illustration I have is in the question of canned goods. The price has continued along year after year, fluctuating but very little, but the supply in 1925 was double any previous year's production and the year 1926 does not fall materially behind, yet an overproduction of field corn one year reduced the price from $1.2 to less than 30c.

Diversification. Another says that diversification is the remedy for the farmer's problem, yet when the western wheat farmer changes from the production of wheat to corn, he helps himself and ruins the corn producer and when the southwestern cattle producer changes from live stock t

PLOWING PEAT LAND

Ernest A. Larson, a Minnesota dairy farmer, finds that with his tractor he can plow his twenty acres of soft peat that was difficult with horses, as they sank so deep in the soil they could not pull the plow.

cotton, he may help himself but he has ruined the cotton producer. So we find that diversification is simply switching the load from one commodity to another.

Centralized Trade Control. We take as illustration both the chain store and the labor organizations and we find that the chain stores have been gradually absorbing both the buying and retailing of many commodities, and are in a position to control the marketing of such commodity in such locality. We also find that labor unions refuse the demand of the country to reduce wages following the war. They had sufficient bargaining power to maintain their wage schedule and to date have not suffered material reduction.

Price Fixing. It is the desire of the friends of the farm people to formulate legislative machinery that will assist in placing farm commodities under like control. We believe that in order to do this federal legislation is necessary. For this reason after five years of study there has been presented a legislative plan to provide such machinery.

Government Board. First there is organized a Government Board composed of a member of each of the land bank districts. The purpose of this is to have the Board representative of all of the different interests in the different sections of the country. This Board will have a similar influence on national farm policies to the Federal Reserve Board on national banking policies. It will assist in determining the advisability of legislation and also carry out the various functions provided in the bill for the control of crop marketing machinery.

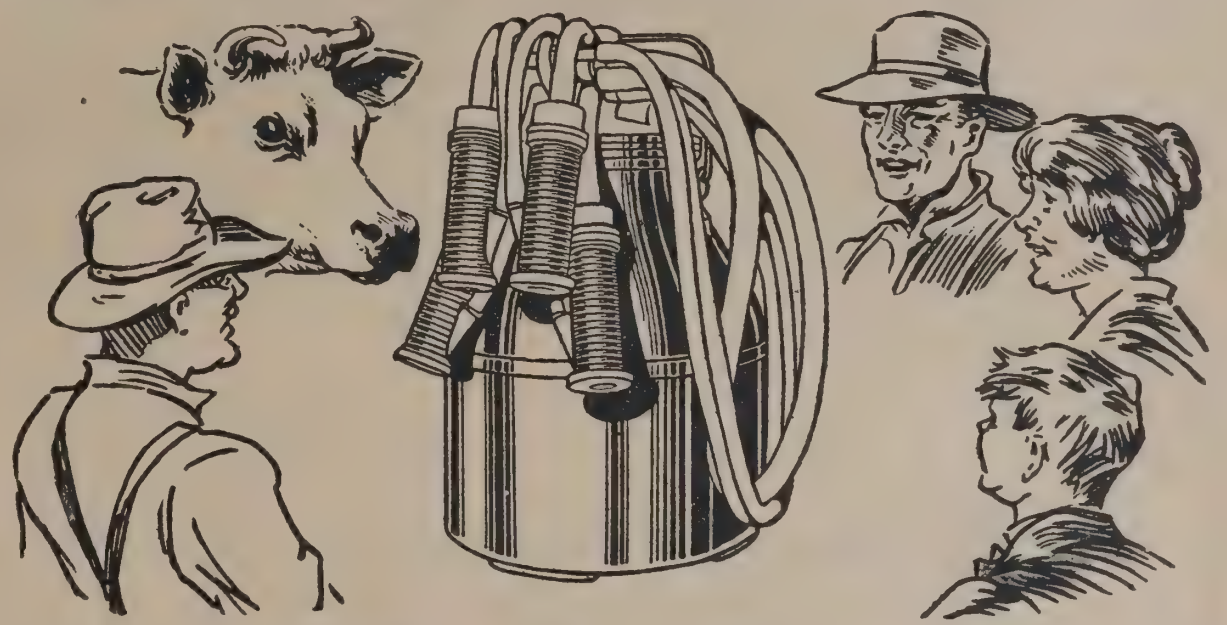
Operating Period. This Board will have the right to designate an operating period when there is a depression in the price paid for such commodity. These commodities at the present time are limited to five in number. In my judgment when this machinery proves its worth this number will be greatly increased. At the present time it is the feeling that it should be confined to a limited number until put to a thorough test. Further this Board has a right after an operating period is declared to designate an agency, consisting of a cooperative producers' marketing organization to take over and handle such a commodity. This agency will determine the price at which they will try and market said product. This price would be a modest price paying only a fair return to the producer. In this way machinery would be organized that would tend to stabilize the price of such commodity at a figure fixed by such agency.

Equalization Fee. In order to pay the expense of the marketing of this commodity and particularly to cover the loss on a surplus, either domestic or foreign, a charge is to be made against the unit of such commodity as it enters interstate commerce. This charge to be made either at point of entry or at point of processing. This fee would serve two purposes. First, it would raise a fund to finance the loss on such amount of the commodity as the agency was compelled to market at a loss, and second, it would have a tendency to check the flow of such commodity into the centralizing market. The less of such commodity that reached the centralized market the easier it would be for the agency to sustain the price.

Conclusion. It is not the contention of the friends of this legislation that it will immediately bring prosperity to the farmers of this country, but it is their contention that if machinery of this kind were placed in operation it would tend to stabilize the return on farm commodities to where the farmer would not go bankrupt one year and make an excessive profit the next. It would make the price of the farmers' commodities more stable and soon they would be allocated into the economic equation of the day at the price agreed upon by the agency so designated. If the farmers' business is stabilized at a fair price then it will be up to the farmers of the country to face the future and either survive or perish with the trend of economic conditions. No one has predicted that this will bring prosperity to the front door of the farm, but the only contention is that it will give the farmer a fair chance economically against the business world.

[EDITOR'S NOTE:—The above is a resume of an address delivered by Congressman Dickinson of Iowa before the annual meeting of the National Association of Commissioners and Secretaries of Agriculture. Congressman Dickinson is an Iowa product, country bred and corn fed, and lived on a farm until he was 22 years old. Finally he went to college and studied law. He located in a county seat town of four thousand inhabitants and practically the only litigation he ever handled involved a farm question of some kind.]

Digestible and Total Protein



Hoard's Dairyman and the University of Maryland say the digestible protein in a concentrates mixture to be fed with timothy hay and corn silage should be between 18 and 19 per cent. A milling company says that a mixture containing 25 per cent protein is needed for these roughages, and a manufacturer of mixed feeds says a mixture containing 24 per cent protein should be used. Why the difference? Who is right?

Clarksville, Md. E. S. Z.

The difference in these figures is due to the fact that one is calculated on the basis of digestible protein and the other on the basis of total protein. In calculating rations digestible protein is the basis; in stating the content of nutrients in a feed the manufacturer uses the total protein as the basis. About 85 per cent of the total protein in a feed is digestible. On this basis the feed containing 25 per cent total protein would yield about 21 per cent digestible protein and the 24 per cent feed about 20 per cent digestible protein.

The mixture containing between 18 and 19 per cent digestible protein is advised on the basis of the Haecker feeding standard. The mixed feeds are advised partly on this basis and partly on the basis of making sure the roughages are adequately supplemented. Both are right within reasonable limits.

Aunt Ada's Axioms: The farm is one of the best places to find real home life for there the whole family works together.

The Whole Family Likes it!

FATHER likes the De Laval Milker because it saves so much time, produces more and cleaner milk, and makes milking cows so much more profitable.

Mother likes it because there isn't so much help to care for, and because milking doesn't require the help of the whole family.

Brother likes it because it is so much fun to milk with it, and because it enables him to take the place of a man in milking.

The hired man likes it, too, because milking is so much easier, and he and the boss "trade off" milking every other Sunday, so that one has a full day off.

And best of all, the cows like it because of its regular, stimulating and soothing action—and prove it by giving more milk.

Prices slightly higher on the Pacific Coast.

MYERS

A Pump for Every Purpose!

THE MYERS LINE offers the most complete assortment of hand and power pumps made. Wherever water is required—there's a Myers Pump or Water System to deliver it—economically—efficiently—and with dependable satisfaction.

Take Off Your Hat To The MYERS
PUMPS — WATER SYSTEMS — HAY TOOLS — DOOR HANGERS

Quality built throughout—by an organization of over fifty years experience in pump making—the Myers Line enjoys a world-wide reputation for reliability that can be depended upon under the most trying conditions.

Myers also builds a complete line of Stayon and Tubular Door Hangers—"Honor-Bilt" Hay and Grain Unloading Tools—Spray Pumps and Power Spray Rigs. Your dealer will gladly show you the Myers Line and demonstrate for you its unquestioned superiority.

Write us today for his name—the Myers Catalog—and complete information about the Myers Products that interest you.

BUSINESS THE E-B LINE FOUNDED 1852

$1.03 per year—that's all

That's the average upkeep cost of an E-B Spreader. Mind you, that is not an exceptional figure for one spreader. It's the average figure for 30,000 E-B Spreaders that have been in service for years. The E-B Spreader you buy will have the same long-lived construction as these 30,000 which have made a remarkable record for low upkeep.

Coupled with this economy of upkeep is ease of operation. The E-B Spreader spreads seven feet wide, consequently it travels only about half the distance other spreaders must travel to cover the same area. It turns a square corner, drives through a six foot door and the tight bottom saves the liquid manure. Its convenient height, 41 inches, makes loading easy. Mail the coupon for detailed specifications of this spreader and any other implement in the good old E-B line that has been saving money for farmers since 1852.

Surplus Control Legislation

HON. E. S. BRIGHAM, VERMONT

MANY of the remedies suggested are concerned with what the government ought to do to relieve agriculture of burdensome surpluses. I come to you as one who believes that the troubles of the agricultural industry are based upon fundamental economic causes which can best be corrected by farmers themselves with the guidance rather than the financial help of governmental agencies.

What Can Be Done to Make Agriculture a Good Business?

It is a fundamental concept of economics that utility and scarcity are the factors which give value to a thing. The air we breathe has utility but it is so plentiful that we do not have to put forth any effort or labor to obtain what we need. On the other hand, bread is not only a utility but it is relatively scarce. Therefore we have to devote land and labor to the production of breadstuffs, labor and machinery to the transportation and preparation of these breadstuffs from the fields where they are produced to our tables and we must give something valuable in exchange for the capital and labor employed in this production. Suppose the owners and controllers of lands throughout the world should increase their acreage in wheat to the limit of possibility; suppose milling and baking facilities should be correspondingly increased and as a result twice as many loaves of bread should be offered in our markets. Bread would then become so plentiful that it would be deprived of its element of scarcity and its exchange value, its ability to command other commodities, would fall to almost nothing.

If we study any industry which is successful in the business sense we find that that industry has first of all so adjusted its production to the demand for its goods that the price or exchange value of its product is maintained at a level which will enable that industry to pay the costs of production and a profit.

Effort is now being made by many industrial interests to avoid the dislocations incident to the ups and downs, the alternating booms and depressions, of the business cycle by keeping in such close touch with production and consumption that business will not overextend itself and suffer a violent depression but will have a constant flow of moderate prosperity. This same adjustment, more difficult of attainment for agriculture, is nevertheless an indispensable condition of business success in agriculture.

Policies Need Revision

Our conception of agriculture, which is responsible for our policies, needs revision if agriculture is to be made a good business. When the farm family was a self-sufficient unit it became a fixed idea that we could not have too many farms or too many farmers, and our federal government encouraged the rapid settlement of our public domain first by sale to settlers at a low price and later by gift to those who would become cultivators. This policy led to a rapid extension of our farm area. In the years from 1870—1880 we added to our cultivated area 297,000 square miles, a territory equal in extent to Great Britain and France combined. The result was the disturbance of the farming industry in the older section of the United States and in the whole world. The present depression is less severe than that suffered by eastern farmers from 1870 to 1900. Still believing that there could not be too many farms or too many farmers, agriculture was not given time to recover from the effects of free land distribution before the federal government began a program of reclamation of waste lands by irrigation.

According to a statement furnished me by the Secretary of the Interior as of June 30, 1926, the federal government had under irrigation on its various projects, 1,320,300 acres of land while preparations are already made to supply water for nearly 500,000 acres additional. The government has expended in reclaiming this land a total of nearly $162,000,000 or $87.50 per acre. According to the 1923 Yearbook of the United States Department of Agriculture the exemption of settlers from interest on construction costs has been estimated at approximately $70,000,000, which is referred to in the Yearbook article as an indirect subsidy to settlers on these projects. The first session of the 69th Congress remitted over $14,000,000 of charges on irrigation projects.

For more than half a century our federal and state governments have maintained experiment stations to investigate the problems of plant and animal growth and colleges to instruct the youth of the land in the science and art of agriculture. The federal government has maintained a great department of agriculture the greatest department of agriculture in the world, and the several states have also their departments for the promotion of agriculture. Until very recently the work of these various agencies centered almost entirely upon the problems of greater production without relation to the business problems of the farm.

The opening of new lands, irrigation of waste lands, the work of all the agencies solving the problems of production have been good work, but as conditions change our policies must be changed. Solution of the business problems of agriculture now

MAPLE ARCH FARM

This farm is located in Kewaunee County, Wisconsin. It was built up by Henry Harman and is evidence that he was one of the most progressive and successful farmers in his county. At the time of his recent death, a friend wrote that he was first in many things. "First to grow alfalfa extensively by liming and inoculation, first to join the cow testing association, and always in the forefront in promoting and taking part in practical neighborhood co-operation. He was a good farmer, a good neighbor, and one of our first citizens."

eeds our closest attention. These roblems demand not only education- work which will lead to a more effi- ent and lower cost production, but so educational work which will lead a more efficient and more economi- l system of marketing and recog- tion of the fact that in the future, nds should be developed only as eeds require.

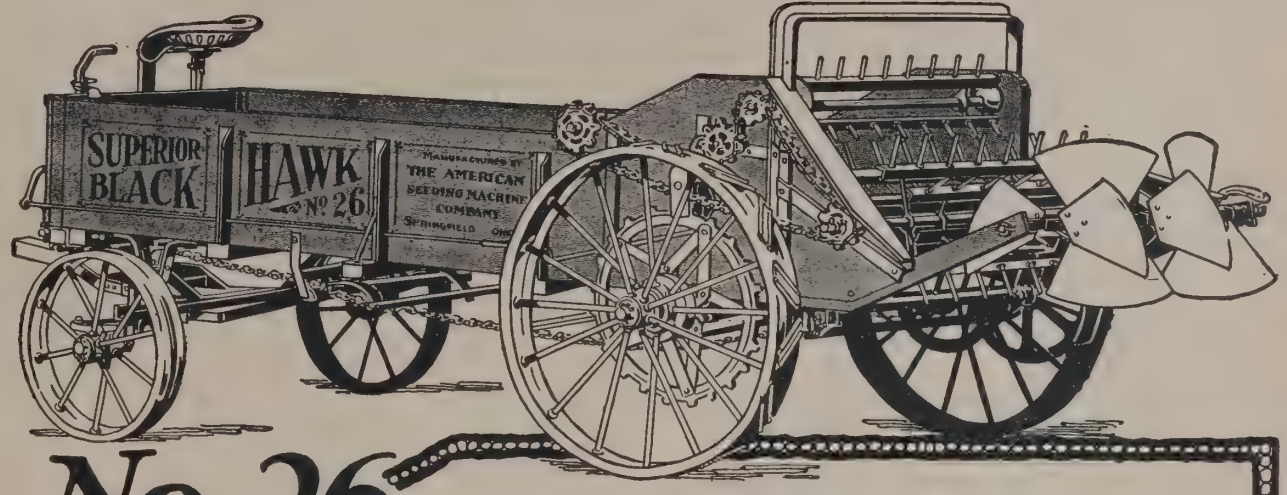
Effect of the World War

The World War introduced into griculture, just as it did into nearly ll industries, many disturbing ele- ents. The outbreak of the war ound us in a period of declining ex- orts of farm products. However, onditions in Europe soon created a emand which absorbed the produc- on of our farms at prices greatly in xcess of the normal. These prices ere so high that the owners of the etter farms had left after paying he expenses of production a large urplus of cash return. Farmers and usiness men mistook what was an bnormal condition growing out of he war for a permanent condition f agricultural prosperity and there esulted in many sections of our ountry a great land boom. For in- ance, the average value of land and uildings per acre of Iowa farms ncreased from $96 per acre in 1910 o $227.09 per acre in 1920. This ifference of $131.09 per acre largely dded by the war boom to Iowa land eans the addition of more than four nd a quarter billion of dollars to the apitalization of the lands of the tate and it also means, on the basis f a 5½ per cent on this capitaliza- ion, the addition of approximately 0 cents per bushel to the cost of rowing corn in that state. Land ooms in agriculture, like booms in ther classes of real estate, bring alamitous consequences if they over- each themselves and while our sym- athy must go out to those who pur- hased corn belt land at high prices, o those who loaned them the money ith which to buy, and to those who nce inventoried their acres at the ncreased figure, yet there is no feasi- le remedy for the losses and defla- ions which have come upon them xcept to take their losses or get a irect national subsidy in such form hat it will not stimulate greater pro- uction. Agriculture will never be a ood business in any region on the asis of inflated land values.

Prosperity Through Congressional Action

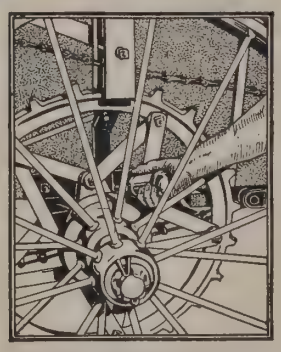
In many sections of the United tates there is an insistent de- and that the Congress of the United tates enact a law calculated to make griculture a good business by stor- g and exporting surpluses of farm roducts and thereby relieving the omestic market of their burden. ome favor doing this at the expense f the treasury of the United States -that is at the expense of all the eople; others would make a levy pon farm products to reimburse the reasury and thereby throw the ex- ense upon the farmers themselves. The proposals made really mean at demand is made upon the Con- ress of the United States to pass a w which will exempt agriculture rom the economic penalties of over- roducing. If agriculture is overpro- ucing at present prices, what will appen if Congress does enter upon policy of raising prices. Thirty- even million acres devoted to cotton 1923, with a moderate crop, pro- uced in round numbers ten million ales of cotton which brought farm- rs an average price of 31c per pound nd stocks on hand were worked off. rom 1923 on we had a progressive ncrease in our cotton acreage and arger yields. Our 1925 average was arger than that of 1923 by nearly ,000,000 acres. Prices were prac- ically cut in two and over 5,000,000 bales were carried over to compete with this crop. In 1926 we again added over a million acres to our cotton acreage. The price is now ruinously low to producers and there is prospect of a carry-over of 7,500,- 000 bales to conflict with the crop of 1927. Cotton can be carried for many years and our production can be greatly extended if the govern- ment can make cotton growing profit- able for everybody who wants to go into the business of growing it. But is it policy to employ capital and la- bor in growing cotton and in storing a supply of it far beyond the world's needs for years to come? We might just as well face now the problem of adjusting our supply of cotton to the demand as to wait until we have overhanging the industry several years' supply in storage.

The legislation proposed would in- crease rather than lessen the evil of overproduction. Furthermore, it is based upon the fallacious notion that somewhere in the world there exists a demand for any surpluses of agri- cultural products we may create. Such is far from being the fact. The surplus of most farm products is now worldwide.



Farmer at Disadvantage

We are now in a period of indus- trial prosperity which has brought about general employment of labor at high prices. The farmer as the un- derdog today, let us assume, can re- ceive sufficient consideration from Congress so that one of the export plans can be passed and become a law. Let us assume that the plan works and results in higher prices be- ing paid by the American consumer for his food than is paid for that same food sold in other markets. Let us assume that in a short time we have an industrial depression with consequent unemployment. Let us remember that representation in Con- gress in the lower House is in pro- portion to population and the Presi- dent and the senators are elected by popular vote. Let us remember also that only 26 per cent of the gainfully employed persons are engaged in ag- riculture. Can we conclude, in view of this situation, that the prospect for farm relief through political ac- tion has anything to recommend it from the standpoint of stability or permanency?



Farmers Should Resist Price Fixing Policy

Do farmers themselves want fastened upon the agriculture of this

No. 26 gives a Wide Spread with an Easy Pull!

Alemite Lubrication.

THE SUPERIOR BLACK HAWK No. 26 affords the farmer the very latest improvements and develop- ments in manure spreaders. This big, light weight spreader does a perfect job of distribution. It completely pulverizes the manure, spreading it evenly over a wide sur- face with a spreading range of 4 to 28 loads per acre and operates as effectively on hillside as on level ground. Posi- tively the lightest draft spreader on the market and although of large capacity is easily handled by a two-horse team.

A wide spread and an easy pull—combined with complete pulverization methods, wide quantity range, short turning radius, large capacity and durability make the *perfect manure spreader—*

SUPERIOR BLACK HAWK
with Complete Alemite Lubrication

The Superior Black Hawk is equipped with a complete Alemite lubricating system as used on automobiles and other high grade machines. Each bearing is fitted with an Alemite cup and a 1,500 pound pressure gun is furnished. Heavy oil can easily be forced to every part of the bearing which insures a thorough job of lubrication, thereby reducing wear and length- ening the life of the spreader.

FARM EQUIPMENT WEEK
February 28 to March 5

EDITORIAL COMMENT

PARENTS AND CLUB WORK

"Whatever success I have had in club work I owe to my mother," said 20-year-old Kenneth Hinshaw of Washington who was recently declared one of the most outstanding 4-H club members in the United States as winner of the Moses Local Leadership Trophy. "When the hour was the darkest," he went on, "she always said, 'Cheer up, son, it will all come out in the wash.' "

When Kenneth paid tribute to his mother, who was his only living parent, in this beautiful way he spoke a great truth. Parents have a lot to do with the success or the downfall of their children whether it be in club work, at school, or in the everyday things that go to make up life.

Almost invariably the success of an outstanding club member can be traced back to the interest of the parents. Mr. J. H. Kaiser, an Iowa farmer, but not a *dairy* farmer, urged his 10-year-old daughter and her older brother to join the dairy calf club. He attended club meetings with them. He even took them on a trip into Wisconsin to help them pick out good calves.

What was the result? Today a beautiful herd of dairy cows occupies his barns. His daughter, Gertrude, was declared the champion junior judge of dairy cattle at the 1926 National Dairy Show. Both his daughter and his son, Herbert, are a part of the farm firm of J. H. Kaiser & Co. Herbert has also made a fine club record.

"Where is A—?" a farmer of our acquaintance asked his wife early one summer's evening.

"She's gone to bed," was the reply.

"Has she led her calf today?"

"No, I don't think so," answered the wife and mother. Whereupon the father called the daughter and insisted that she get up and lead her calf. She did. That girl is one of Wisconsin's best calf club members.

In some localities there are "4-H Club Mothers' Associations." The mothers are organized to help their children. We generally find that these are the places where the boys and girls are doing the best club work and getting the most out of life. We need more of these "Club Mothers' Associations." They rank with parent—teachers' associations in importance.

But parents can, and must, function without organizations of this sort. It's the friendly encouragement, the sound advice, and occasional mild discipline that counts. And this is done first in the home. It's impressing the boy or the girl with his or her responsibility; it's working with the club member; it's attending meetings with them once in a while. These are the things that parents can do, and when they do them, satisfactory results are reflected not only in the children but in the home itself.

STABILIZING DAIRY PRODUCTS

The keen rivalry between the states of Minnesota and Iowa in the recent butter scoring contest held at the annual meeting of the National Creamery Buttermakers' Association created considerable excitement. It was first reported that Iowa had won, and they celebrated the occasion. Later it was found that Minnesota had won by so small a margin that it was necessary to go to the second decimal place to find the difference in the score of the ten highest entries from Minnesota and Iowa. The Gopher State carried away the banner for the first time since 1922.

The averages of the contending states for the banner were: Minnesota 94.5746, Iowa 94.5550, Wisconsin 93.3730, and South Dakota 92.8210.

What particularly interested us in this butter contest was that the fresh butter made in Minnesota scored 95.025 and her storage butter 94.6. The storage butter was made in June and yet there is less than one-half a point difference in the score of that butter and that made just prior to the convention. It shows that the methods of manufacturing butter are improving and that our facilities for storing butter keep it fresh and sweet almost indefinitely.

We believe the dairy interests do not fully appreciate how much has actually been done toward bringing about a system of manufacture and storage which is doing much to stabilize the price of dairy products. When butter was largely made in the summer it was cheap and before the days of cold storage, it was put away in cellars. Invariably this butter developed a strong flavor before spring and was not a satisfactory food product.

The development of a good cold storage system and improved methods of making butter have made it possible to put away the summer surplus and then market it in the winter in about as high a state of perfection as when it went into storage. This improvement in manufacturing and storing butter, together with more winter dairying, has had a tremendous influence in stabilizing the prices of dairy products. Buttermakers' conventions and butter scoring contests have helped to bring about this improvement in the dairy industry.

THE McNARY—HAUGEN BILL

In our issue of January the 10th we published a resume of the McNary—Haugen Farm Relief Bill and a few statements of proponents and opponents of this bill. In this issue we are publishing a resume of two addresses, one delivered by Congressman E. S. Brigham of Vermont and the other by Congressman L. J. Dickinson of Iowa.

It is our purpose to give our readers a clear understanding as to what the McNary—Haugen Bill proposes to do and point out the meaning of some of the phrases so commonly used by those seeking so-called farm relief legislation.

The phrase "stabilization of prices" is frequently used. It should be clearly understood that stabilization of prices means an attempt to hold prices at a more uniform level. It may mean advancing or it may mean lowering prices.

There is an advantage to be gained through the stabilization of prices. For example, if we could keep butter from going to such a low level in summer as it frequently does and keep it from being so high in winter, we believe the price of butter, on the average, would be higher. When butter reaches the retail price of sixty cents or better a pound, some consumers eat oleomargarine and this is not to the advantage of the dairy farmer.

"To make the tariff effective for agriculture," is a phrase also frequently used. It is well known that tariff does not protect an industry as effectively when that industry overproduces as it does when the industry produces just enough to satisfy domestic demand.

To us, the chief difficulty with farming today is the single crop system and overproduction. We have not been able to comprehend how legislation proposing to take care of surplus would help sections of the country that are suffering from the single crop system or planting more acres than is needed to produce the required amount of a certain crop. Alfalfa hay, for example, is selling for $25 to $35 per ton to dairy farmers in the Middle West, South, and East. Corn and cotton are selling at very low prices. It is plain more land in these sections should be devoted to growing alfalfa hay, and we might well suggest other crops. Manufacturers whose products are protected by a tariff would not be benefited by it if they overproduced, and we do not comprehend how agriculture can expect to receive protection from a tariff when it overproduces.

"Surplus" is another term commonly used. What is surplus? No definition can be given that could not be effectively challenged. We commonly understand surplus to mean the quantity of product not needed for immediate use. There may be more than one kind of surplus: Seasonable surplus, due to a favorable crop year, and surplus by planting more acreage of a certain crop than is needed, or both. We can comprehend how an export corporation could be formed for the purpose of handling seasonable surplus, but this is quite another matter than handling acreage surplus and very likely created because of an attractive price.

In 1920, 35,878,000 acres were devoted to cotton and they produced 13,444,000 bales. The average yield that year was 178 pounds per acre, or 8 to 10 pounds above the average. The world consumes in the neighborhood of 12,000,000 bales of American grown cotton yearly—perhaps a little less, but the 1920 crop had over 1,000,000 bales of surplus. The acreage in 1920 is somewhat in excess of the average for that period, but for the purpose of illustration it may be considered reasonably normal.

In 1926 we had quite a different problem, for the acreage devoted to cotton was 47,653,000. Over 11,000,000 more acres were devoted to growing of cotton in 1926 than in 1920. The yield was 187 pounds of cotton per acre, or 18,618,000 bales. This seasonable increase per acre was better than 17 pounds, a very small quantity, or less than 2,000,000 bales; while the actual surplus that is above what the world immediately needs is over 6,500,000 bales and is largely accounted for by increased acreage.

It seems to us that unless acreage devoted to a crop can be controlled, the proposed legislation in the McNary—Haugen Bill must ultimately fail. Price stimulated this increased acreage of cotton. Millions of acres of land have been opened in the Southwest because cotton is as profitable there at 12 to 14 cents a pound as it is in the Southeast at 18 to 20 cents. At least this is the statement made by Mr. B. L. Moss in the Progressive Farmer in the issue of December 18. In the southeast part of our country cotton growers need more than 18 cents a pound, in most instances, to make a profit from growing cotton. If the price of cotton were stabilized at 18 cents a pound, it would not be satisfactory to many in that section of the country, but it would be an attractive price to those growing cotton in the Southwest, and more acreage would be devoted to growing cotton. Who will buy this increased quantity of cotton? We do not care how well a firm is organized, how long it can carry its product—if it continues to overproduce, ultimately it will fail. Can we hope through legislation to protect agriculture from the influences that affect other industries?

The dairy industry, we believe, is more fortunate than any other branch of agriculture. We are better organized and through our own efforts we are stabilizing the prices of dairy products. We have not gone as far in stabilization as is desirable, but we have made splendid progress in this direction and without national legislation. For example, we have learned how to make butter from sweet cream that will remain in storage for several months and come out with about as high a score as when it went in storage six months previous. This permits storing butter during the peak of production and selling it during the time of low production. Through organization of milk marketing companies, the price of fluid milk is being stabilized. Effort is being made to eliminate the cow that does not pay for feed consumed and should there be a overproduction, it doesn't take long to dispose of a sufficient number of low producing cows to bring the production down to a point where prices will be fairly remunerative. Methods employed in stabilizing prices of dairy products, and this is being done by the farmers themselves and their representatives, are far more effective than can be accomplished by any legislation secured through Congress.

We must remember, too, that if Congress has the power to advance prices, it will have the same power to reduce them. We do not believe Congress has very much power to affect permanently the prices of farm products, for if they are fixed at the level which many people desire them, there will be overproduction and they will break ultimately to very low levels. This would be positively injurious to agriculture. If Congress through laws were to lower prices so it would be unprofitable to grow

roducts, the farmer would refrain from growing hem.

We can conceive of a plan to care for seasonble surpluses and prevent them from unduly deressing prices of farm products, but unless omething is done to control acreage and to get ingle crop sections to diversify, we can compreend nothing but serious disappointment in the roposed legislation to take care of farm urpluses.

As we desire our readers to fully understand his subject, we commend to their consideration the iscussion in this issue by Congressman Dickinson f Iowa who argues for the McNary—Haugen Bill nd another article by Congressman Brigham, a armer of Vermont, who argues against it.

Will Sweet Clover Reseed Itself

We have 20 acres of sweet clover that was seeded in 1925. It was not pastured or cut and in 1926 it all went to seed. Will this come up next year, in 1927, or will we have to break it up?

Beloit, Wis. F. D. T.

If the sweet clover that went to seed on the twenty acres was a reasonably good crop or if the plants were well scattered over the field, there will be no necessity of reseeding again next spring. Unless one has very positive information as to this, it would be well to watch this field very closely next spring and see if the sweet clover comes on in reasonably good condition and is well distributed over the field. If there is only a fair stand and the field is to be used for pasture, it might be well to go over it with a disc drill seeding oats together with 5 to 10 lbs. of scarified white sweet clover seed. If the sweet clover is a poor stand, the oats will come in to fill up the spaces and the sweet clover that has already caught will make with it a very good pasture crop. The new seeding of sweet clover will then come on for late summer pasture. This combination of oats and sweet clover will also make a good grade of hay if the oats are cut just after they come into bloom and before it has passed into the hard dough stage.

Labor Saving Information Wanted

As a subscriber of some ten or twelve years to your paper I have learned to look in it for all the latest information on all matters connected with dairy farming. However, lately I have looked in vain for information telling how our newest problem is being met by different practical dairymen. This problem is how to get along without the extra man labor needed in haying and silo filling. Perhaps this trouble has not appeared in the farms of the West and Middle West, but here in the East it is a very great problem. It is not a matter of hours and wages, as these men refuse to work on farms under any terms when work on public projects can be had.

Is it not possible for you to collect and publish some information on labor saving methods and machinery used in different parts of the country in making hay and filling silos?

On this farm the first problem is how to get in our hay with the very least amount of man labor. We have a tractor for power and use a hay loader. The hay loader is a labor saver in the field but also causes lots of labor trouble as I have had man after man quit the job when asked to work on the wagon with the loader. We also use a power fork to put the hay in the mow but we need at least two men to mow away. Farmers must have met this labor shortage by labor saving methods or machines, but unless you bring this information together where we can read about it we will never hear of it.

Our next trouble comes at silo filling time. Here we harvest and bind the corn a few days before filling. When filling we have a man or boy in the silo, a man to feed the cutter, three teams and teamsters, and three men to load. This combination works well when we can get it but lately it is almost impossible to get the men to load and the teamsters will not do it. Neighbors help each other as much as possible and there are some silo filling rings here but they all have the same labor shortage. I have heard that there is some kind of a machine that harvests and cuts the corn ready for the silo while in the field. This machine would save the loaders if it works. Is there such a machine and is it practical under farm conditions?

I think if you would ask your readers to send in any ideas that they have tried to save time and labor you would get a number of interesting and useful plans that would be of great help to all of us.

Lee, Mass. J. G. E.

The economy in the use of labor saving machinery is dependent in part on the size of the enterprise and the adaptation of the machinery to the type and contour of the land. The combined header and threshing machine has been found practical on the large grain farms of the West, but its use on smaller farms is of doubtful economy. In Northwest Canada they do not use this machine because they must harvest their grain before it is entirely ripe, partly to avoid danger of frost and more particularly to get the grain into the shock before it has matured sufficiently so that the hard winds that occur in that section do not thresh it out of the standing grain.

This is only one illustration of many that might be given to show the diverse application of machinery to the farm enterprise. It illustrates the difficulty of making exact and definite statements as concerns any farmer's particular problem. We would appreciate suggestions from readers as to how they have solved the labor problem on their farm.

In our own operations we have found a decided reduction in the labor in the caring for hay through the use of the side-delivery rake and the hay loader. We do not understand why a man should particularly object to working on the wagon when the hay loader is in operation. It doubtless keeps him pretty busy, but if there is a small boy to drive, one man can quite conveniently take care of the load. We have seen at fairs a device that can be used in mowing away hay, but we have seen none of these in operation. It consists primarily of a platform swinging from the hay track or rafters, so as each forkful is dumped it will throw it to one or the other side of the mow according as the platform is tipped one way or the other.

The combined corn harvester and silage cutter has come into considerable use on a number of the larger farms, as also in some communities where farmers can so co-operate as to make the use of such equipment practical. This machine cuts the corn, puts it through the silage cutter which, in turn, elevates it to a wagon box that is driven along the corn rows as the corn is cut. When the load is completed, it is hauled to the barn and dumped into the silage blower or elevator.

To relieve the amount of labor in the silo, it has been found quite practical by men who have reasonably deep silos, say 40 feet or more, to run the silage blower into the center at the top of the silo and then merely permit the silage to build up in a cone as it is filled, leveling it down only when the top of the silo is reached. If the corn is sufficiently moist and the silo deep enough, this seems to give sufficient packing to prevent moldy and spoiled silage.

Sudan Grass for Pasture

On March first I will move to another farm and will be short of pasture the first year unless I make use of some emergency pasture crop. I plan to seed some sudan grass for this purpose. How many pounds of seed should I sow per acre? When is the best time to seed sudan? How tall should it be when ready for pasture? If cut for hay will sudan grass make more than one cutting? If alfalfa is seeded in the spring will it be advisable to use it as a hog pasture the first year?

Rockford, Ill. S. J. M.

Sudan grass is one of the best of the crops that may be used for emergency pasture. About 15 to 20 lbs. of seed per acre are recommended for hay or pasture. This may be seeded broadcast and harrowed in or drilled. The seed bed should be prepared as for corn. Nothing is gained by seeding earlier than May 15 and quite a marked decrease will result if seeded after June 1. Sudan grass will be ready to pasture about 6 weeks after it is seeded under normal conditions. It ceases to be of much value after the first killing frost in the fall. There is a very slight danger from poisoning if frosted sudan is pastured. This danger is said to be eliminated if the frosted grass is made into hay. Higher yields of hay of better quality may be secured from two cuttings than from one cutting but the expense involved makes only one cutting advisable, in which case the second growth is pastured. If only one cutting is made the grass should be cut when the seed is in the soft dough stage. If two cuttings are made, the first should be cut just as the heads are forming, in which case there will be more difficulty in curing because of the high water content at this stage of growth. Seedings made May 25 will reach the soft dough stage in the head about August 25.

It is not advisable as a rule to cut for hay or pasture alfalfa in the fall of the same season the seeding is made. If one should have unusually favorable results from the spring seeding, such that there is a good stand of vigorous plants grown up to 18 to 24 inches tall in the fall, one could pasture the growth lightly with pigs.

Questions From a Beginner

I am a new subscriber to your paper and likewise new at dairying. I find myself in need of considerable information some of which I am asking for at this time. All the hay I have is timothy. With this I have been feeding a mixture composed of two-thirds oats and one-third corn. My five cows have gone down to 40 lbs. of milk daily since they came off grass. This is not 40 lbs. each but for all of them. They will not calve until next spring. Would a good 24% protein mixed feed bring them back?

Are cooked cull beans good for cows?

Are raw potatoes good?

Is whole soft corn good?

What results could I expect from apple pulp as a feed for these cows? Is this pulp good fetilizer for potato ground?

Can a man raise a balanced ration for dairy cows in this part of Michigan?

Leonard, Mich. L. I. C.

A good 24% protein mixed feed would not bring the production of these cows back to normal at this stage of the lactation—nor would any other mixture of feed do this. In fact it is likely that a very good ration would have but little influence in bringing up the production after the cows have gone down to the low level indicated. There is one certain cause of their going down and there may be one other cause. The certain cause is found in the ration of timothy hay and corn and oats. The ration is too low in protein; it lacks succulence and variety; it likely became somewhat unpalatable. Dairy cows require digestible protein and carbohydrates in the proportion of 1 to about 6.8, whereas this ration supplies these nutrients in a proportion of 1 to 11. A second factor that may have contributed to the causes of the reduced production has to do with the natural inherited persistency of the cows. The inheritance of these cows may dictate that they tend to dry up sooner than is desired. This is something that cannot be influenced materially at the will of the owner. The stimulus for producing milk is very much greater during the first half of the lactation period than during the last half. If cows are not supplied enough feed to meet their requirements during the first half of the lactation period they will take some nutrients from their bodies if they be persistent producers and thereafter they will decline rapidly in production after which it is impossible to return them to what otherwise would have been a normal flow of milk. With timothy hay as roughage these cows should have had a concentrates mixture containing about 20 per cent of digestible protein such as would be supplied in a 24% total protein mixed feed.

Cull beans either cooked or uncooked are not commonly fed to dairy cows. They have a greater usefulness for sheep and swine. A pound or two of the beans daily to each cow if ground and mixed with the concentrates would not be objectionable.

Raw potatoes are sometimes fed to cows in limited quantities when the price is low. Fifteen to twenty pounds per head daily should be the limit of allowance.

Whole soft corn is better than whole hard corn so far as the physical properties are concerned but even then it is advisable to grind all grains for dairy cows.

Apple pomace or pulp from cider mills is about equal to corn silage. It is low in protein like corn silage and should be properly supplemented with protein feeds. It should be fed like corn silage—about 3 lbs. daily for each 100 lbs. live weight.

Apple pomace contains a little more dry matter than corn silage. It is not quite as high as corn silage in nitrogen, phosphorus, and potassium, the three principal elements usually considered in fertilizers. In the sense that potato fertilizers are usually considered, apple pomace is not a good fertilizer although there is no objection to using it for this purpose.

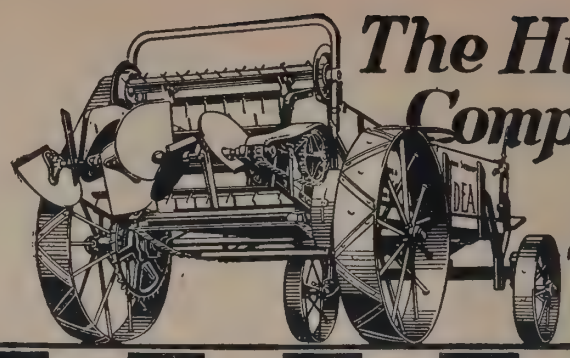
So far as location is concerned one should be able to grow alfalfa and good silage corn together with oats and barley in this section of Michigan. This is being done successfully in the first county south. With these crops grown in abundance and in proper proportion one would not need to purchase very much of commercial feeds. This location is either in or on the edge of the area already infected with corn borer. What the future holds for the control of this pest no one can say. This much may be said, however, that of the known methods of combatting the pest, putting corn in the silo and cutting it low to the ground offer the greatest destruction to the borers of any crop handling method.

A Cow Guessing Contest

JAY L. LUSH, Texas Agricultural Experiment Station

IN order to test the ability of the average dairyman, a cow guessing contest was arranged for the attendants at the Farmers' Short Course at the Texas A. & M. College early in August last year. As the regular milking hour approached, each person was given a card and was told to go into the milking barn and to pick out the five highest producers of milk, age considered. The judgment was to be entirely on the basis of milk production and no attention was to be paid to fancy points or to breed type.

The conditions of the contest were just what a prospective buyer of cows for a commercial dairy would encounter if he went to buy some cows from a herd where production records were either not kept or not available to the prospective buyer. The only information given the contestants was the age of each cow and the stage of lactation period for each cow. Only those cows were included whose production had been recorded for at least one full lactation made under normal conditions in the experiment station herd.



There were 27 such cows and 17 people attempted to pick out the five cows which had the highest average age-corrected milk records. One person picked out three of the five. Eight persons got two of them right. Six persons got one right. Two persons got none of the five highest producers. But that does not tell the whole story. One of the five cows evidently looked almost as good as she performed because eleven of the seventeen judges had included her in their list. However, two of the five best cows did not receive a single vote. The very best cow in the herd got six votes and the fourth best cow got seven votes. On the other hand, the cow with the lowest record among the 27 received four votes. The cow with the third poorest record among the 27 received three votes. The sixth poorest cow among the 27 received six votes, the seventh poorest received one vote, and the tenth poorest received one vote.

Enough has been said to show that this group of people could not pick out the high producing cows with a very great degree of accuracy. Yet it need not necessarily be concluded that they were poor judges as compared to average men and women interested in dairy cows. I am sure that they would be willing to challenge a similar group of practical dairy folks to beat them in picking out good cows under similar conditions.

The nature of the data makes it seem inadvisable to go into any more detailed analysis of them. However, it may be worth while to take a moment to compare the accuracy of these people's judgment with the accuracy of a week's milk record, or of a year's milk record, or of body measurements, or of expert judges' scores as indicators of a cow's producing ability. A number of detailed scientific studies have been made of these indicators of producing ability with the following general results, after allowing for age: first, that a year's milk record is a much better indicator of a cow's future production than these people's judgment was; second, that the record for the best 7 days is a little better indicator than these people's judgment; third, that a cow's weight (if comparisons are only made within a single breed) is almost as accurate as these people's judgment; fourth, that the most reliable body measurement is quite a little less accurate than these people's judgment; and, finally, that total score as given by an expert, who had in mind breed type as well as production, was only about half as good an indicator of production as was the average judgment of these people who were looking for production alone without regard to type.

Scientific studies have also been made of the reliability of selecting the high producing cows by the recorded production of their near relatives, with the general result that a man without ever seeing the cows could pick out the high producers on the basis of the normal records of a daughter, or of a dam, or of a full sister, about as accurately as these people picked out the high producers merely by looking at them. More distant relatives are not nearly as accurate but are of some use as indicators.

It seems clear that fairly kept normal records of actual production are a more reliable means of estimating a cow's future milk production than is the average man's judgment alone or the records of the cow's close relatives alone. Fortunately, we do not have to restrict ourselves to any one method of estimation in actual practice, but can use all three. The question of just how much importance to attach to each method is one which has been much discussed but never settled. The breeder would want to pay more attention to individual appearance and to pedigree than would the man whose main business is to sell milk or butter. For instance, the cow which had the poorest record of the 27 in this guessing contest, as an individual has a rather desirable conformation (as witnessed by the fact that four people voted for her as one of the five best cows) and her dam had one of the very best records ever made in this herd. Also, her dam has fifteen half sisters in the Register of Merit. We are betting that this cow has good blood in her in spite of the fact that both of her records are uniformly low without any apparent excuse, such as sickness. We may be wrong, but with pedigree and type both speaking so strongly in her favor, we will take a chance on her. She will not be culled until we get more

The Highest Compliment in the Spreader Field

WHENEVER competitive design in the spreader field is under discussion — whenever some special feature or performance is mentioned—sooner or later one statement is *sure* to be made

"— as good as the NEW IDEA"

For the man who is buying a spreader, this means just one thing—that the *real* value, the *biggest* money's worth, the *surest* success is to be obtained from the NEW IDEA itself. The *original* wide-spread spreader was the NEW IDEA. Today the standard of spreader excellence is *still* the NEW IDEA. Have the nearest NEW IDEA dealer explain to you the merits of our Model 8 and you will understand why NEW IDEA continues its unchallenged leadership — after twenty-eight years of service to the American farmer.

The New Idea Spreader Co.
Dept. 12 Coldwater, Ohio U. S. A.
Largest independent spreader factory in the world.
Not in any trust or combination.
Over 4,000 agencies. Branches everywhere.

New Idea Transplanter

All New Idea products are noted for their originality and invention. You will find them fully covered by patents. Leadership is a New Idea habit.

New Idea Husker and Shredder

This "Red Strand" top wire means — there is more copper *in* it, more zinc *over* it—that you'll get more years *out* of it

"Square Deal" always has had the reputation of being a real good fence. Dealers were proud to sell it. Fence buyers were proud to own it. All knew it as a long lasting, farm fence that was sure to give many extra years of service.

Then, in 1923, we discovered and patented "Galvannealing"—as big an improvement over galvanizing as the binder was over the cradle.

"Red Strand" Fence

is our old reliable "Square Deal"—but made of copper-bearing steel and "*galvannealed*" instead of "galvanized."

In "Red Strand" wire we put more copper, making the steel extra rust resisting. On "Red Strand" we weld more zinc that keeps the rust out longer.

This double protection—more copper and more zinc—makes "Red Strand" the longest lasting fence we ever built.

Ask your dealer for "Red Strand" prices. You pay nothing extra for the extra years of wear woven into every roll.

Fence for Profit

Learn how. "Cost of Fencing Farms," "17,000 Farm Folks Say," and "Hogs and Fence" are booklets written by farmers. You will enjoy them. Write for these and others on how to test fence wire and the Keystone catalog. All are free.

evidence about her. That evidence ought to be available soon, for her first daughter is soon to freshen.

We can sum up for most dairymen the problem of selecting a high producing cow in the following words (with apologies to Paul): And now abideth individual appearance, pedigree, and an actual production record, and the greatest of these is an actual production record. The conservative man will use all three.

Grain Mixture for Alfalfa

I have good alfalfa hay as roughage, and can buy corn at $46, oats at $40, barley at $40, and bran at $46 a ton. Could these grains and the bran be properly proportioned as to make a suitable mixture for feeding with alfalfa hay or should I have linseed meal, cottonseed meal, and beet pulp? What mixture do you suggest and at what rate should it be fed? My cows average about 4 per cent fat in the milk.

Farson, Wyo. J. E.

Where alfalfa hay is the only roughage fed and cows given all they will eat of it, the grain mixture need not contain more than 10 per cent of digestible protein to properly balance the ration. Such a mixture could be made of 200 lbs. each of ground corn, oats, and barley, and 100 lbs. of bran. It should be fed at a rate of about 1 lb. for each 3½ lbs. of milk produced.

The alfalfa hay fed to the limit of appetite will furnish a surplus of protein but where this hay is comparatively cheap and grains high in price, one can better sacrifice protein by feeding the alfalfa hay to the limit. So far as protein requirements are concerned, one would not need linseed or cottonseed meal. Beet pulp would be a valuable addition to the ration if it can be purchased at a reasonable price.

Seasonable Live Stock Notes

What can I do to make my supply of feed hold out until grass comes? is a question being asked right now by a good many dairymen. Some will skimp on the feed and keep all their cows. This is a poor way to get the greatest value from the feed. Some will sell the poorest cows; this is a good way. Some will buy more feed; this is a good way provided the cows kept are good ones. Buying more feed to put into scrub cows is not good management.

High Priced Roughage

A farmer from a mid-west state writes in to say that he is paying $32 a ton for alfalfa hay. Alfalfa is being grown successfully in this state. It is seasonable to suggest in this column that men who are paying this much for roughage make some inquiry about the best ways of growing alfalfa.

Feed Plenty at Peak Production

At this season of the year the cows that freshened in November and December are at peak production. It is a good practice to follow this production up closely with plenty of the right kind of feed. If this is not done these cows will soon come down too much in flesh and then in production. Once down in production it is impossible to bring them back to normal for the remainder of this lactation period.

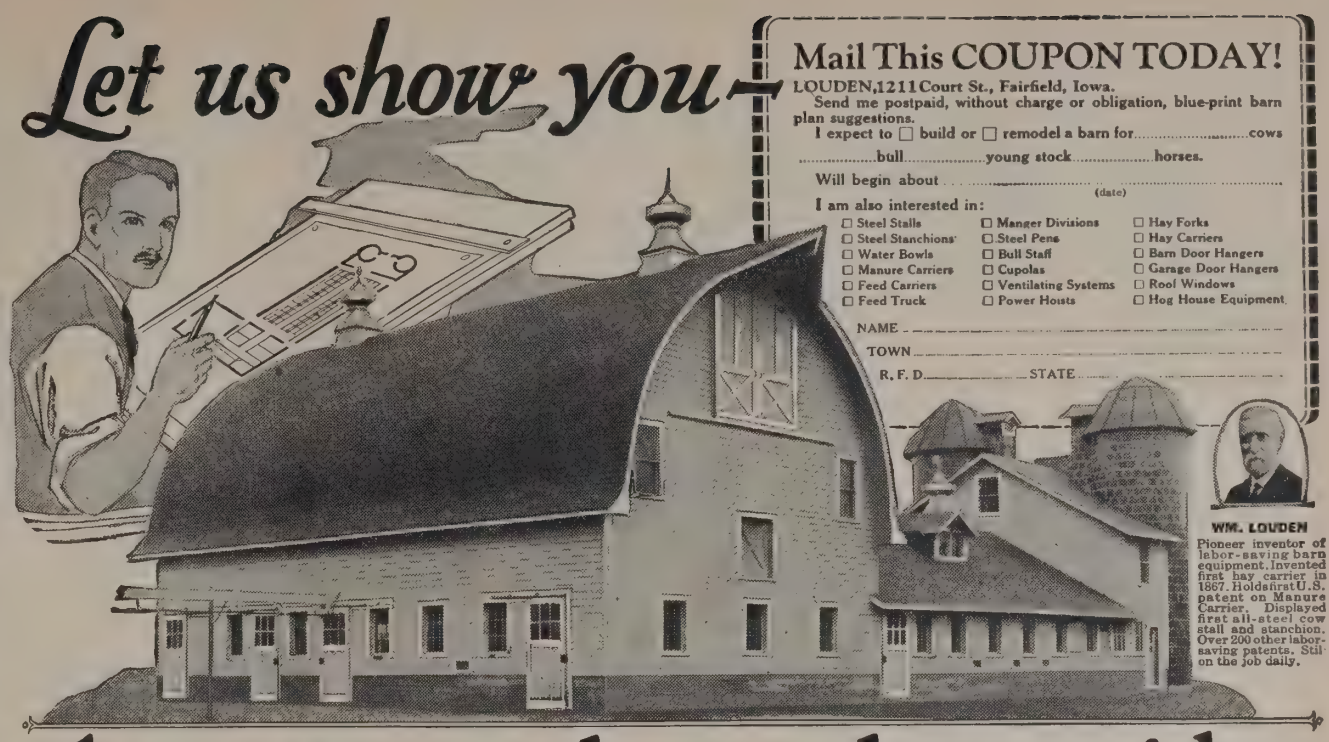
Alfalfa Hay for Sows

Pregnant brood sows need a high quality protein along with other nutrients if they are to farrow strong litters of pigs; they also need exercise. There is no better way to give these than to supply some good quality leafy alfalfa hay in a rack some distance from the sleeping quarters.

Cow Comfort

All dairy cows should be treated kindly at all times. The cows that freshen in mid-winter during severe weather should have an extra helping of kindness. Besides warm, dry, comfortable stalls these cows should be fed a warm bran mash for two or three days after they calve and the water offered them should be at least as warm as 60 to 70 degrees F.

Frozen Silage



It is not always possible to avoid some frozen silage in severe winter weather but even so there is little excuse for feeding it to cows while still frozen. The dairyman who does not offer his cows ice water should not offer them frozen silage. Some silage freezes when too much is thrown down at a time. Some silage freezes when no precaution is used in removing from the silo. Keep the middle higher than around the edges. This will help some.

Injured Udders

The loss in cow usefulness and in milk production from injured udders is greater than is generally realized. Go into any good sized herd housed for 5 to 7 months of the year and ask the owner about three-quarter and half udder cows. In the nature of things in the cow barn some of this injury cannot be prevented. Some of it, however, is due to carelessness in bedding and to undue roughness in handling cows. This much can be prevented. Partitions should always be provided between cows and will help to materially reduce the number of injuries.

Frosted Headgear

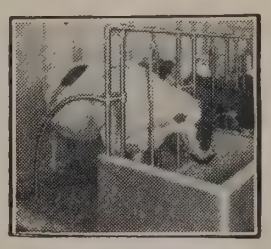
A good treatment for frozen combs and wattles of poultry is to rub gently into the affected parts a mixture of vaseline and glycerine to which have been added a few drops of turpentine. Rubbing the ointment in gently helps to restore circulation.

Clip the coupon at the top of this page—fill it in—and mail it right now for the most helpful information on barn building and remodeling that has ever come before you. No charge. No obligation whatever. We do not build barns. We do not sell lumber. Our purpose is to help you plan the building and get the best possible barn for the money put into it.

Whether you are building a new barn or remodeling an old one the Louden Barn Plan Department will gladly help you to—save waste of lumber and labor in building—arrange the new barn to save hours of time and thousands of needless steps each year in feeding, cleaning and watering—provide adequate, roomy mow capacity—establish proper floor levels—best type of roof construction, etc. Over 15,000 barns have been built from Louden plans. Just tell us the number and kind of stock you have and when you intend to build or remodel. We will send you free blueprint plan suggestions to fit your needs. Send the coupon!

You'll be interested in the latest news about Louden Stalls and Stanchions. The coupon will bring that too—how they save time and labor in taking care of cows and give cows real pasture comfort in the barn—comfort that makes more milk daily.

You'll want to know about Louden Water Bowls which banish that cold, disagreeable job of turning the cows out twice a day to shiver down a drink of icy tank water—and pay for themselves the first winter in increased milk production. And the Louden Manure Carrier that makes boy's play out of barn cleaning.



Here's what other farmers say:

"We have two barns Louden equipped. We think, and neighbors say, they are better than any others."—H. G. Wiley, Holman, Wis. "Louden Litter Carrier is the greatest labor saver on this or any other farm."—R. S. McDonald, Lakewood, N. J. "Pleased with my new barn equipment. The best—that's Louden. I've tried others."—Hugh F. Whitney, Pulaski, N. Y.

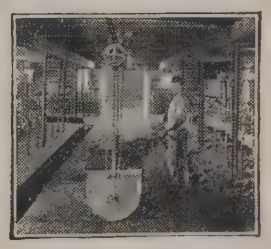
Pay-from-Income Plan

We have an Easy Payment Plan for the installation of this better equipment. Ask us for details. Check the coupon for illustrated descriptive matter on Steel Stalls and Stanchions, Manure Carriers, Feed Carriers, Trucks, Water Bowls, Steel Pens, Manger Divisions, Bull Staffs, Cupolas, Ventilating Systems, Hog House Equipment, Hay Unloading Tools, Power Hoists, Barn and Garage Door Hangers—"Everything for the Barn." Don't put it off. Mail the coupon today.

LOUDEN LABOR-SAVING BARN EQUIPMENT

Cows Make More Milk With Louden Water Bowls

Increase milk flow at once. Reported gains from 10% to 40%. Let us submit proof that Louden Water Bowls, by keeping pure tempered water always before the cows, actually repay their cost and earn a profit besides, before the first winter is over. Lengthen lactation period. Save turning cows out to water in zero weather. Do away with tank heater expense and nuisance. Make possible more sanitary conditions. Prevent spread of disease from cow to cow through water. Use coupon for booklet.

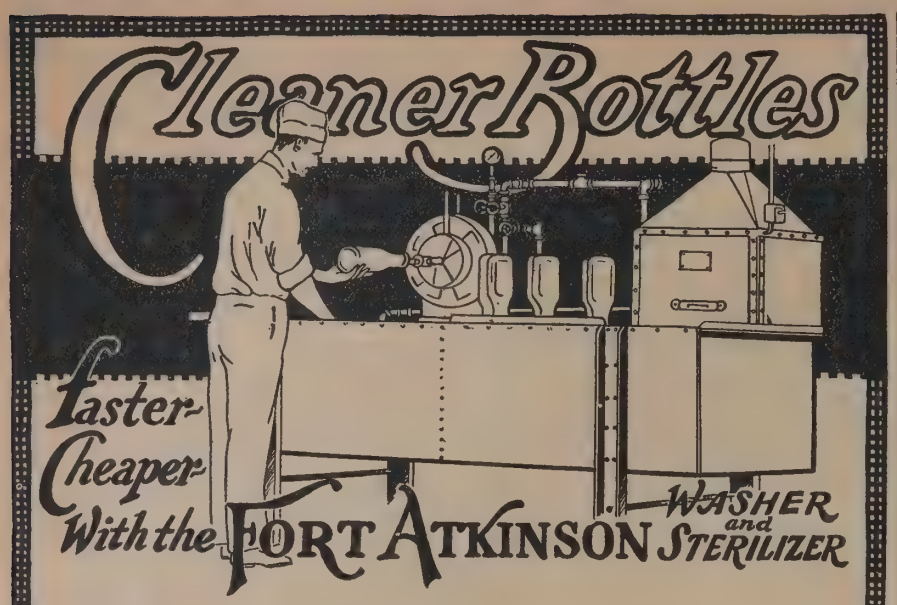


"All Through Dad—It Only Takes Half the Time Now!"

Louden Steel Stalls and Stanchions make the cows more comfortable and more productive, and effect a big saving in work. You'll realize that when you are freed from the drudgery of taking care of cows in the old fashioned unsanitary wooden stalls.

With Louden Stalls your cows are quickly stanchioned and released. And your cows have real "pasture-comfort" in the barn, which makes big milk yields. Leading farmers and dairymen will tell you so. Help cows yield every drop of milk and every cent of profit possible from each pound of feed. Can be used with built-up manger curb which saves waste of many pounds of feed each year.

NOW! Fill out and mail the coupon above before you lay this paper away. Get this money-saving, work-saving Free information.



End Barn Cleaning Drudgery

Why go on loading wheelbarrowfuls of manure—lifting, balancing, straining and trundling them out one by one—when it is so much easier to roll out five wheelbarrow loads at one trip with this big, smooth-running Louden Manure Carrier? 12 bushels to a load. An easy push. A boy can easily clean your barn with it in half the time spent by a man with a wheelbarrow. Worm gear hoist, durable track, heavy spot-welded tub. Quality to the smallest detail. Greatest Manure Carrier value on the market. Use coupon for folder and prices.

A Farm Gate From New Zealand

N. P. NEAL, NEW ZEALAND

THE accompanying illustration shows a gate which is in use in New Zealand. It was designed by the Director of Canterbury Agricultural College—the premier agricultural college in that progressive dominion. A casual glance will show that it fulfills all the above conditions. The posts, which are of concrete, are about 12 inches square in section. The gate is made of flat and angle iron, is securely braced, and, together with the posts, is practically everlasting.

The attention of readers is drawn to the following features of the gate and posts:

1. The posts are built of reinforced concrete and are placed about four feet in the ground.

2. The gate is not swung in the ordinary way but by a system of iron straps round the post. Further, the gate swings flush with the face of the post, and allowance should be made for this in determining the exact alignment of the posts. It is claimed that hinges which are inserted into the body of the post are sources of weakness.

3. When closed, the foot of the gate rests on the foot of the post. Thus, the weight of the gate is taken evenly between the two posts, and not entirely at the point of suspension. In closing the gate it is necessary for the operator to lift the gate about one inch in order to bring it into this position of rest. The advantages of this arrangement are that the gate does not "droop" with its own weight. In consequence of this, in operation it is given free movement and hence is not damaged through lack of it, as is so frequently noticed. Should the gate be made of wood, there is less chance of its back being strained or even broken.

4. The gate is fastened by means of a short piece of chain, the end link of which slips over a piece of iron pivoted on a horizontal one-half inch rod inserted in the post.

5. The vertical rod which suspends the gate is round iron one inch in diameter.

6. Angle iron, 1½ inches on each face and ¼ inch thick, is used for the top and bottom rails and for the oblique stays. For the end posts, flat iron 1½ inches wide and ½ inch thick is used. The horizontal, intermediate rails are of flat iron ¼ inch thick.

7. The corners of the posts are beveled so as to prevent these breaking away as would otherwise be the case.

In building the posts, make the molds in four pieces so that by a system of strapping similar to that used in suspending the gate it can be easily handled and kept in position. Holes four feet deep are dug and filled with concrete to the ground level, after which the molds are placed in position. Reinforcement consists of four one-half inch round iron rods, each placed two inches from a corner. In this connection it should be noted that reinforcement in the center of the post is of little value. It should be realized that any strain to which a post will be subject, must be taken by the outside layers of the post in the first place. Hence it is near the surface where reinforcement should be provided.

Showing details of "swinging" the gate. Note that it is "strapped" to the post.

The top of the post is made in a separate mold and placed in position after the post has "set" a few days.

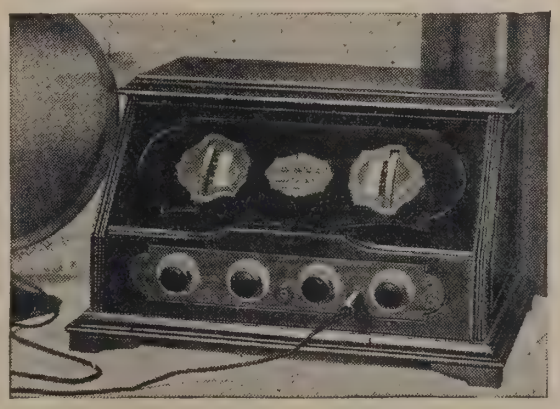
Michigan Milk Producers

At the close of business on September 30, 1926, the Michigan Milk Producers' Association, Detroit, had a net worth of $138,737. A considerable portion of this amount was represented by bonds, stocks, mortgages, and certificates of deposit.

The revenues of the association for the 1925-26 business year ending September 30, were $103,767. The expenses of operation were $83,385, leaving $20,381 as a net gain.

This association of 10,000 producers of fluid milk is a bargaining organization, representing its members in price negotiations with milk distributors. The association was formed at a mass meeting of about 500 milk producers, held at East Lansing, Mich., in the late spring of 1916. It now operates in Detroit, Grand Rapids, Flint, Saginaw, and Ann Arbor.

A SERVICEABLE TYPE OF FARM GATE DESIGNED BY R. E. ALEXANDER, DIRECTOR CANTERBURY AGRICULTURAL COLLEGE, NEW ZEALAND



The set you can depend on for *steady performance*

The important thing to know about a radio set is that you can count on it, always, to be clear and dependable. The farmer needs—not an ordinary set built for a price—but one of finest quality, to get distance clearly—to tune out interference—to perform *steadily* without attention—yet economically.

A Radiola 20 has *proved* it can be depended on. It brings in the lectures and the news clearly. The sporting events are real and live. And music comes through with a clear, full tone that is true to the finest artist's playing.

With its special "amplification," its five tubes have the distance reach of sets having *more* than five tubes. This same amplification helps to make it twenty times as selective as the ordinary set, because it amplifies *only the station you are tuned to.*

A single control brings in all the near stations, with the simplest one-finger tuning. And for far stations, there are verniers, too, to make distance tuning accurate and clear.

Radiola 20, with Radiotrons . $115
RCA Loudspeaker 100 . . . . . $35

Buy with confidence Authorized Dealer RCA *where you see this sign.*

Radiola 20 has a power Radiotron that helps to keep the tone clear—even at big volume. This set can magnify a faint, far signal to natural voice volume—amplifying it one million times—yet keeping it clear and real. Test its tone quality against even far higher priced sets. You will not match it.

These are not mere claims, for they have been proved in the stern "road test" of experience. Every Radiola has the best skill of RCA—of General Electric—and of Westinghouse—behind it. And in Radiola 20, this background of long experience has proved itself in quality that stands up! It is just what the farmer needs—the finest set that has been built for antenna operation and low upkeep cost.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

Jan. 31-Feb. 3—Annual Wisconsin Farmers' and Homemakers' Course, Madison, Wis.

February 1—Wisconsin Dairymen's Association, Madison, Wis. Secretary P. C. Burchard, Fort Atkinson, Wis.

Little Hans came home with two black eyes and a battered face. "Fighting again," said his mother. "Didn't I tell you that when you were angry you should count to a hundred before you do anything?"

"Yes, mother, but the other boy's mother had told him only to count up to fifty."

Vermont Ayrshire Becomes Living Champion

C. T. CONKLIN, VERMONT

ALTHOUGH fed and handled by inexperienced boys committed to the Vermont Industrial School at Vergennes, Vis Bountiful Lassie, a nine-year-old Ayrshire cow, has just completed a year's record of 24,556 pounds milk, 923.21 pounds fat, giving her the honor of being the living champion of the breed in the United States, state champion of all breeds, as well as just three points behind the championship record of Garclaugh May Mischief that has stood for eleven years.

As a member of the dairy herd of the Vermont Industrial School, Vis Bountiful Lassie was fed and handled all through her record by boys and young men committed to this institution. To be placed in charge of this cow was the post of honor in the dairy barn, and according to Superintendent Charles W. Wilson, no herdsman was ever more faithful than the lads entrusted with the daily care of their special charge. In return, thirty-two potential citizens of Vermont enjoyed a quart of milk from their favorite cow each day during the year.

The ration of the new leader consisted of a simple mixture of commercial dairy feeds, oats (of which she was very fond), beet pulp, hay, and corn silage. Unusually cold weather is common in the Vergennes region near Lake Champlain and between the ranges of the Adirondack and Green Mountains, but severe climatic conditions had no apparent effect on "Bountiful Lassie." An average of over eighty pounds of fat was made each month through the winter. It is particularly interesting to note that in eleven months of the year at least seventy pounds of fat were produced, and in no single month was the ninety-pound mark crossed.

With the exception of her horns, Vis Bountiful Lassie possesses the characteristic type of the Ayrshire. A straight top line, depth of chest and middle, and ample capacity throughout are all embodied in this liberal producer. The size, quality, and attachments of her udder are particularly good. In addition to her good records, Vis Bountiful Lassie has been campaigned successfully on the fair circuits of her native state and has several championship ribbons to her credit.

Vis Bountiful Lassie was bred by her present owners and is the fifth generation of this particular family to be bred and owned at the Vermont institution. She was sired by Jack of Hillcroft that was purchased as a calf from Matthew Hannah of Vermont, and has since proven a great sire in the Vergennes herd. Four daughters and two sons have been born to the new champion, and today three of her daughters and three granddaughters are in the herd with their illustrious ancestor.

Under the direction of Superintendent Charles W. Wilson, the Ayrshire herd at the Vermont Industrial School has increased in numbers and production until it is now considered one of the outstanding collections of cattle in New England.

VIS BOUNTIFUL LASSIE, NEW LIVING CHAMPION AYRSHIRE COW OF THE UNITED STATES, WITH A RECORD OF 24,556 LBS. MILK, 923.21 LBS. FAT. SHE WAS BRED AND IS OWNED BY THE VERMONT INDUSTRIAL SCHOOL. "THIRTY-TWO POTENTIAL CITIZENS OF VERMONT ENJOYED A QUART OF MILK DAILY FROM THE NEW CHAMPION"

Difference in Silage

HOARD'S DAIRYMAN:—There is a point in feeding silage to milk cows that I have never seen mentioned but which seems to me needs consideration.

We are told that the amount of silage that will be eaten by milk cows is ordinarily about three pounds of silage to one hundred pounds of cow or about 27 pounds for a 900-pound cow. I have fed cows and weighed their feed in years past, finding that figure to be fairly accurate, and have used it in calculating rations for such cows.

But this year I find that these same cows or similar ones will eat 40 or more pounds of silage very readily. I am thinking that this is because of the wetness, immaturity, and low nutritive content of silage this year, according to its bulk.

My point is that probably these cows are getting no more nutrients out of the 40 pounds than they have other years out of 27, and that whatever the cow will eat should probably be calculated as though it were the regular three pounds per cwt. of cow. Or, in other words, that the three pounds per cwt. is a basis for figuring but not for feeding.

Elk Mound, Wis. G. H. L.

This letter draws attention to an important point in the feeding of cattle. The rules as given for feeding are merely indications as to what should be done. In actual feeding the good feeder notices the response of his cows and he varies his practice according as the animals themselves report to him what scale and type of feeding proves best. Many people misunderstand the meaning of balanced rations and think that when we speak of them it is an arbitrary formula that they are to follow. In the first place, no arbitrary formula can be established because the actual feeding value of forages and grain will vary somewhat from season to season and from section to section. The feeding standard merely considers average feeding values. This is well brought out in this comparison of the silage. Then, too, all cows do not react the same to certain feed mixtures and no herd can be fed as a herd, but properly should be fed as individuals. Almost without exception, however, it will be found that men having good producing herds are feeding a balanced ration according to average analysis. Sometimes it is done with intention and sometimes merely by chance, and as the result of the unconscious selection of feeds by the man gifted by nature as a feeder.

Breakage of Milk Bottles

About 26,000,000 bottles of milk and cream are sold daily in the United States, according to estimates by the U. S. Bureau of Dairy Industry. A dealer must have about four bottles for each bottle delivered daily. This means he must have an approximate investment of from 48 to 54 cents in bottles for each customer.

The average bottle makes about 20 trips before it is lost or broken, according to estimates by Ernest Kelly of the Bureau. The total cost of replacing lost and broken bottles approximates $28,000,000 a year. This expense is a large item in the cost of operating a milk plant, and a large part of this expense is due to loss and breakage of bottles.

Uncle Ab says most of the remedies for farmers' ills are proposed by men who want to remedy their own political fortunes.

Radio Sixty Miles From a Railroad

HOARD'S DAIRYMAN:—The tall pine pole seen at the right of the log cabin, in the accompanying photograph, may be said to be an outpost of civilization. It is a radio antenna mast and though the lead-in wire enters this lowly hut, built of pine logs, it has a vitalizing contact with

THE LOG CABIN OF F. F. PAGE OF ARKANSAS AND HIS RADIO ANTENNA 60 MILES FROM A RAILROAD

the Boston Symphony Orchestra; Allen McQuhae, the Irish tenor; the Philharmonic Society; and occasionally with deliverances of the President of the United States.

Although F. F. Page and wife of Cushman, Arkansas, live 60 miles from a railroad, they travel the Pennsylvania Railroad Company's pullman coaches once a week; frequently listen to orchestras on the steel pier in Atlantic City; go with Cook and Sons on cruises around the world; leisurely accompany Ford and Glenn on "Twin Wheeze" trips around Chicago; follow the "cotton-picking swins" through plantations around New Orleans; bask in the sunlight of "Wonderful Jacksonville, Florida;" go to church in New York City; and attend college in Washington, D. C., by matriculating in the "U. S. Radio Farm School," conducted by the United States Department of Agriculture.

In reality, this isolated farmer and wife rarely, if ever, leave the soil which they till. The pine pole, rearing itself above the lowly log cabin, when connected by wire to a 5-tube radio receiving set on the inside of the pine-log hut, extends its reaches to Broadway, to the boardwalk of Atlantic City, and to Carnegie Hall—envisioning for this isolated farmer and wife the music, the arts, the master speeches, and the rollicking crowds of city life.

Little wonder is it, then, that Mrs. Page, in reflecting upon the former desolation of the countryside 60 miles from a railroad, told Sam Pickard, Chief of Radio Service of the United States Department of Agriculture, that she would not part with her radio receiving set for a "gold guinea." Neighbors, too, for miles around must appreciate this priceless treasure, when on wintry evenings they come in flocks to "listen to the radio," bundling their children in blankets and bringing their "knitting," prepared to keep vigil until late hours at night or, perhaps, in the wee hours of the morning. A stranger traveling in this isolated section of Arkansas, upon hearing strains of selections from Victor Herbert issuing through the muddaubed, chinked walls of this cabin, must be possessed with such an uncanny feeling as that experienced when hearing a voice coming from a graveyard or cemetery.

To Farmer Page and wife, however, radio is a godsend—a friendly counselor in a wilderness, a companion for Robinson Crusoe on an island, or a companion to travel with in a desert. Just after the sun goes down and Farmer Page has finished chopping a large "back log" for the old fashioned fireplace and the good wife has been cautious enough to establish safeguards against the chickens freezing, what a contrast it must be to turn on the filaments of the vacuum tubes, twist the dials slightly, and they hear an orchestra in Atlantic City playing, with the chorus being sung, "At Peace With the World." The oil lamp, on a side table, is figuratively converted into the brilliant, illuminating wonders of a city with its teeming thousands.

When radio brings the city to the country, the farmer who lives in a log cabin, 60 miles from a railroad, can truly realize the philosophy of another who said that the path that leads by my door leads to the end of the world. Civilization, during the last hundred years, has introduced many conveniences and utilities for robbing country life of its desolation and monotony—including the automobile, telephone, and labor-saving machinery. However, no invention is so completely capable of dispelling loneliness and bringing diversions to the countryside as the radio telephone. It has the threefold qualifications necessary to accomplish such an undertaking—it dissipates distance, it travels with the speed of light, and it is a perennial messenger—bringing both entertainment and instruction to the farm home.

Washington, D. C. S. R. WINTERS.

Wheel it in—and start milking!

Nothing to install — no pipelines — no vacuum tanks — no special pails

Gas Engine, Electric or Hand Power

If the power gives out, you or your boy (yes, your 10 year old girl) can pump by *hand. A wonderful* advantage.

Clean in 1 Minute

Just Pump Water Through!

It almost cleans itself. No rubber lined teat cups to wash. No pipe lines or vacuum tanks to clean. No pulsator. No extra parts to bother with. No pails to wash—*you milk right into YOUR OWN shipping cans.* Boon to housewives. *Absolutely sanitary.*

YES, **Mr. Dairyman,** here it is—at last—the milking machine that *solves* the dairy problem!——Find out—investigate—get the catalog and special offer ***now,*** while this special offer lasts!

Here's your one chance with this wonderfully simple machine to find out on a REAL Free Trial what the milking machine will mean for you on your own cows. Why? Because you get this machine and start right in milking; there's nothing to install; nothing to build or fit into your barn; just move the PAGE in and start milking. No bother, no expense. Payment only after you've given the milker a thorough trial.

DO SEND for our monster size circular with letters from hundreds and hundreds of farmers all over U. S. A., telling what they know about Page Milkers and *what these practical farmers say about the way to use a milker! Investigate* —Mr. Dairyman. Don't miss this—write for that circular of farmer letters.

So simple! So very, very simple!

That's the secret of this successful milker. That's why it's *so* easy to clean; that's why the upkeep is almost nothing; that's why the cows take to it so quickly. A positive *stop* of ***all*** vacuum on each stroke of our simple pump; that's *the* way for teats and udder! The secret? Our simple, direct air release pump and teat cup—no pulsator, no rubber lined cup. Our catalog explains. *Read it!*

What Dairymen Say:

Thousands of dairymen write us like this:

"The Page Milker is a Godsend. So simple—so sure and easy to use. It can be cleaned so quickly."—W. F. Wolf, Milford, Mich.

"I have used my PAGE Milker twice a day for over two years, and have milked as high as twenty-two cows. I also want to say that your company has given me the very best of service." Yours truly, Albert E. Nelson, R. F. D. No. 2, West Chicago, Ill.

"The PAGE Milker does very good work and is far ahead of hand milking. It lets us out about one hour sooner than if we were milking by hand."—Frank H. Fuller, Orvell, Ohio.

"I still like my milking machine fine. It is giving entire satisfaction. We are milking fourteen cows and have milked in thirty-five minutes. We could not begin to do it without our machine."—Fletcher Peterson, Rt. No. 2, Brownstown, Ill.

"Can milk 6 cows and strip them in 15 minutes. Cows like it better than hand milking. Easy to keep clean. My wife can use it just as good as I can."—Geo. Miller, Rt. 3, LaSalle, Ill.

down **AFTER free trial**

Don't pay us a cent *until* you are satisfied that this milker is just right for *your own* cows—No money down—No C.O.D. to us. Just wheel it in and TRY it *thoroughly*—nothing to install. *Then* if you are satisfied:

8 months to pay

—and yet, while allowing 8 months, we give you a *rock-bottom price,* direct from the factory. Also our iron-clad 10 year guarantee—yes, 10 years.

Send for complete information on this wonderful milker and the long time payment plan today—**NOW while offer is still open.** Find out NOW even though you are not yet ready to buy. No obligation. Write for free catalog **NOW.**

FREE Book on Milking

"The Page was always a success with me I used it 6 years."—W. R. Olson, Fairchild, Wisc.

"I milk 14 cows in 35minutes."—Arthur Forrester, El Centro, Calif.

"I am milking 250 cows, and I use 3 of your machines. I highly recommend the Page."—G. Anderson, Lemon City, Fla.

"The cows take to it like a duck to water."—Ward C. Baily, Hornell, N. Y.

Mr. Dairy Man: Even if you don't want to try out a milker for many months, do write ***at once*** for our catalog and get your name on our list for our extra special offer. It costs you nothing and no obligation. Now we WARN YOU: write now if you just ***may*** be interested in a trial ***later.*** We ***do*** want you to find out, to investigate—***now.*** Learn about the latest discovery in machine milking, get the facts, the figures. See coupon! Don't miss this chance to ***find out*** the ***latest*** and best news on milking machines.

This offer is POSITIVELY for introductory purposes! Void the day we have a dealer, agent or salesman in your neighborhood. So, if you don't want to try a milker now, *reserve* the right for this offer (also for user agent offer right) later—no obligation. Write at once for catalog or you may be too late.

Burton-Page Co.

Dept. 9621, 400 No. Michigan Avenue, Chicago

BURTON-PAGE CO. Dept. 9621
400 No. Michigan Ave., CHICAGO

Please send me your free booklet containing the facts on milking machines and full details of your free trial, easy payment offer on the Portable Page Milkers.

Also copy of your 10-year guarantee, and your mammoth size circular of letters from farmers telling how they use your milker on their own cows.

Name.....

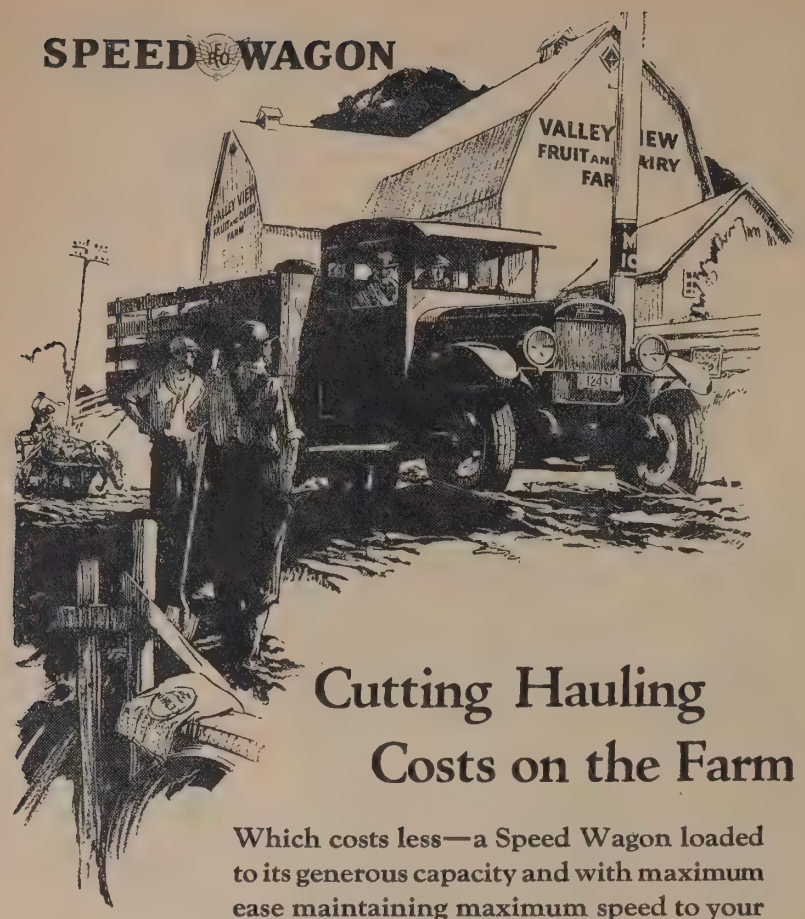
.....



Would you like to be a FARMER AGENT?.....
Some farmers have made big money as agents *without* leaving the farm.

Do you also want our cream separator offer?.....

If you are going to be in the market for a separator any time within the next twelve months, state here about when?.....

The editors of many leading farm papers know the Page Milker. A leading editor said, "I advise you to investigate all good machines, including the Page offer as per coupon above."

SPEED WAGON

Cutting Hauling Costs on the Farm

Which costs less—a Speed Wagon loaded to its generous capacity and with maximum ease maintaining maximum speed to your markets and home again? Or an overloaded light truck banging over the roads, risking damage to load and truck, wasting costly hours in slow traveling?

Which costs less—the thousands of easy trips to market, the years of efficient service, the low depreciation, moderate upkeep, and constant reliability of the Speed Wagon? Or the heavy depreciation, the steady charges for maintenance, the loss and bother of layups, the short life of the too-light truck?

Last year 49% of the Speed Wagons sold to farmers were purchased by former owners of too-light trucks, by men who had learned the answer to the question "Which Costs Less?"

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Organize to Solve Farm Troubles

HOARD'S DAIRYMAN:—I have just finished reading an article, written by Mr. C. Fleming, which appeared in the December 10 issue of your magazine. Mr. Fleming suggests that the salvation of the farmer lies in a fixed price on farm products. I am wondering if Mr. Fleming has stopped to think what would happen if there were a fixed price on everything the farmer produced. This is what would happen: Say, for instance, that the government had set a price of $1.00 a bushel for potatoes. I, and every other farmer that I know, would increase our output of potatoes fifty per cent. What would happen? The market would be flooded at once. Then, I am wondering what Mr. Fleming would have the government do with the surplus of potatoes that the consumers could not use. It was all very well for the United States to set a fixed price on farm products during the World War, when all of Europe was anxious to buy everything we could produce for them. Our government could well afford to set a price then, for no matter how much the farmers produced they could sell it to the Allies. However, now there is no anxious Europe to take our surplus off our hands when we cannot handle it ourselves. If Mr. Fleming will suggest a solution for this problem of disposing of the surplus which would result, I will agree with him that the government set a standard price.

Banking conditions, Mr. Fleming states, are O. K. for the city business man but not for the farmer. I, as a farmer, have always found the banks quite fair. I have always been able to get what money I wanted on a 90-day note. When that time is up, I can go back to the bank, pay my interest and renew the note for another ninety days. In that time even the least prosperous farmer should have gotten the money to pay his note. I don't believe the farmer or anyone else can ask for anything more reasonable from the bankers.

Mr. Fleming speaks of the advance in prices just before Christmas. It seems to me that every wide-awake man or woman, who knows of these conditions, (and who does not?) can arrange to buy their $20.00 hats and their $500 fur coats some other time. If I understand Mr. Fleming rightly, he mentions the above articles as necessities. Perhaps farming is a more prosperous occupation in Pennsylvania, but I'm sure that in my part of the country we do not consider $500 coats and $20 hats a necessity. I have lived for some time, but I have yet to see the common farmer whose wife did not consider these articles as luxuries.

Perhaps I have seemed too harsh on the farmer. You who read this may think that I believe there is no help for the farmer. There is, but it lies with the farmer himself. The solution to his problem is, that the farmers must organize. There is no other class of people who are not organized. Even the laborers in the city have their labor unions. I suggest this, then, to the farmer. Organize, and your troubles are over. If all the farmers would get together, decide upon their output for a certain year and stick to that. the consumers would have to pay them a fair price. As long as each one tries to cut the other's throat by trying to produce just a little bit more than the other, why expect better treatment from the city people than we give each other?

So far, the farmers have been unable to co-operate and work together. When they can, if that time ever comes, there will need to be no more agitation for a standard price set by the government.

A LUMBERJACK FARMER.
Oneida County, Wis.

Dairy Advancement in South Africa

HOARD'S DAIRYMAN:—Dairying seems to be coming into its own in this area and I am convinced, in no small way, that this is due to the influence of your paper. As times goes on, with improved methods, silos, etc., this area is destined to take its place among some of the largest producers of dairy products in the Union of South Africa. Our present handicap is finance, but no one knows better than I do that there is no better means of lifting mortgages than through the help of the right sort of *dairy cow.*

In the past we have had all our "eggs in one basket," growing maize, but many have been rudely awakened this year to the fact that success is impossible on the present lines. Hence the change—silos, stables, and out with the scrub!

At present I'm interesting myself with the establishing and growing of alfalfa on dry lands. We have an excellent black soil which grows up to 27 muids of 200 lbs. per acre, in a good season, without fertilizer. This land has natural available lime in the soil and is very retentive of moisture. I am quite convinced that it will flourish here under ordinary conditions; in fact, a few plants that are growing in my garden with no attention whatever, prove this to me.

I do not wish to mislead you with regard to the maize yield quoted. This is naturally an exception. The usual yield is 10—15 muids of 200 lbs. per acre, and the average on most farms over a number of years is in the vicinity of 8 muids.

I wish you continued success and hope at some future date to be able to report good progress here—on the right lines. STUART AYLWARD.
Pretoria, South Africa.

For the Five-day Dairy Cow

HOARD'S DAIRYMAN:—Henry Ford and William Green, president of the American Federation of Labor, want an 8-hour, 5-day week. How would the proposition work out for the dairy industry? Can cows go without milking and children go without milk from Friday night till Monday?

These gentlemen are doing all they can to make general labor discontented till it's near impossible to get help in the dairy line—with a 7-day week—at a price the business can afford to pay.

Other industries than Ford's must be made to pay for his advertising.
Ohio. E. G. SCRIPTURE.

She: "Would you go through fire and water for me?"

Store Boy: "Look here; if that's the kind of fellow you're looking for you'd better marry a fireman instead of a grocer's clerk."—Progressive Grocer.

Winter with Linseed MEAL

Winter—
THIS Winter—
can be made the most profitable season you have yet had. Linseed Meal is the key to cheaper gains in milk, meat, wool and eggs.

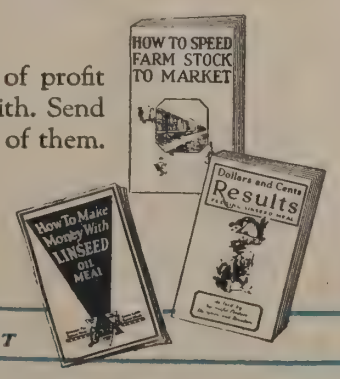
Means Spring *the year 'round*

As you watch your cattle standing in the winter's snow and ice, mud, or slush —you dream perhaps of the springtime—with its rich forage of luxuriant grass; your thoughts turn to the increased production that comes with pasture.

But wait—have you given due consideration to that actual rival of summer pasture —a rival in conditioning, laxative, and proteid properties—*Linseed Meal?*

Do you know that many farmers get results equal to or better than with pasturage by dry-lot feeding it the year 'round?

Do you realize that in proper combination with other feeds it pays as high as 100%?



We want you to understand those proper combinations—then you'll be an all-year-'round *Linseed Meal* enthusiast as are thousands of others.

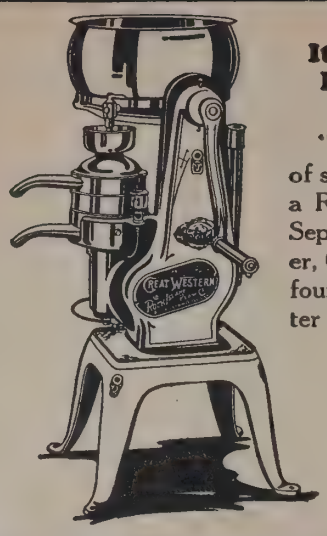
Linseed Meal Pays—with *All Farm Animals* —including poultry.

Let others tell you their stories of profit in the booklets described herewith. Send to Dept. T-1 for any one or all of them.

"How to Speed Farm Stock to Market"

is the title of a brand new book that will prove of great value to every one who buys, feeds and sells hogs, cattle and sheep. It emphasizes the fact that skillful marketing is equally as important as skillful feeding. It shows how Linseed Meal enables the feeder to market his live stock thirty to forty days earlier than otherwise, but is primarily a book of "pointers" on the best weights, the best time and the best place to buy and sell. By all means get this book—and the others, too, if you do not already have them.

"Dollars and Cents Results"



This book written by successful dairymen, feeders and breeders—practical men who have learned by the hard knocks of experience the "100% value" of Linseed Meal.

"How To Make Money With Linseed Meal"

This book written by Prof. F. B. Morrison, author with W. A. Henry of the famous book, "Feeds and Feeding," and Director of the Wisconsin Experiment Station.

LINSEED MEAL
EDUCATIONAL COMMITTEE
1128 Union Trust Bldg. Dept. T-1, Chicago, Ill.

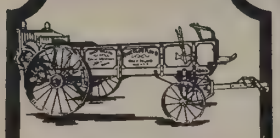
FEED Linseed MEAL PAYS AS HIGH AS 100% PROFIT

It Tested 4/100 of One Per Cent Butterfat in the Skim Milk

"I have just tested a sample of skimmed milk separated with a Rock Island 'Great Western' Separator and sold by your dealer, Carl Owen & Sons, here, and found 4/100 of one per cent butter fat in the skim milk."

Sanitary Creamery Co.,
Boscobel, Wisconsin.

Rock Island "Great Western" Cream Separator



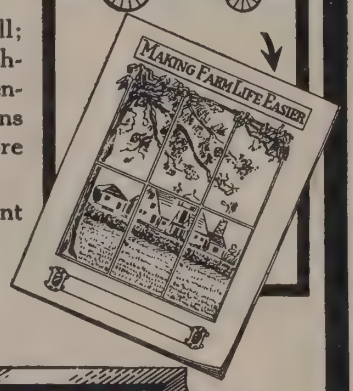
Noted for its skimming efficiency—the vital feature which determines the profit you make from your dairy products.

The combination of the Rock Island disc skimming device—bottom outlet for skim milk and the law of gravity—makes the cream just naturally go to the top and out of the cream outlet, while the skim milk goes downward and out of the bottom outlet.

Low-down supply can—easy to fill; slow speed, close skimming, perfect flushing, self-draining bowl; ball bearings; enclosed self-oiling gears—these are reasons why you will take pride and make more profit in using a "Great Western."

Sold by your Rock Island Implement Dealer.

FREE BOOK—"Making Farm Life Easier" illustrates and describes this cream separator and a big line of farm tools in which you are interested. Write today for free book C-54.



Rock Island "Great Western" Endless Apron Spreader

Your choice of style spreaders with the famous "Great Western" continuous ratchet feed—a success for over 30 years on hundreds of thousands of spreaders.

Tell us which style you prefer, and we will tell you how the spreader made by the Rock Island Plow Company will be a profitable investment for you.

Rock Island No. 1 Tight Bottom Spreader

Rock Island Plow Company - Rock Island, Ill.

FOR OUR SPECIALTIES —
Rennet Extract, Rennet Powder, Rennet Tablets, Cheese Colour and Butter Colour
WE REQUIRE A
GENERAL REPRESENTATIVE
willing to push none but our products in this special line and to take up the EXCLUSIVE SALE FOR UNITED STATES OF AMERICA.

Our brand has for decades been considered the Standard in most milk-producing countries; we are indeed the largest manufacturers of dairy preparations in Continental Europe.

GEBRUDER BAYER, Augsburg (Germany)

Keep Track of Your Cows

Know what they are producing. Such knowledge pays big dividends in cash.

We will send samples and prices of our handy milk record sheets for five cents in stamps.

GLOVER'S IMPERIAL DOG MEDICINES

News from Washington, D. C.

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, D. C., Jan. 15—A new, complete commercial powdered milk plant has been installed in the laboratory of the Bureau of Dairy Industry recently, and was put into operation on an experimental scale January 10. The plant is a model and replica of a commercial unit in every respect except that it is slightly smaller in size. It is a very important addition to the equipment of this dairy industry laboratory.

It seems certain at this time that the Lenroot Milk & Cream Import bill will be passed at this session of Congress, but there are disquieting complications in connection with it which are of some interest, especially to those who are watching legislative trends with an eye to future possibilities along legislative lines dealing with the milk industry. The bill was reported favorably by the Committee on Agriculture by a unanimous vote after a hearing in which most of the opposition was nullified and withdrawn by reason of an amendment which would permit milk and cream from borderline farms, that is within 20 miles of milk plants on the American side, to handle their milk to and through these plants if there it was properly pasteurized or processed either as fluid milk or as condensed or evaporated milk. Then it came up for debate in the Senate January 6.

Senator James A. Reed of Missouri at once took a position in opposition to it, claiming that it seemed to be a move to give a milk monoply to the producers living around New York and Boston, instead of being a health measure. They have the right to control the sanitation of their milk either in these cities or in the states through state laws, he claimed; why then seek the power of the federal government to put a restriction on imports.

Senators Bruce of Maryland, King of Utah, Walsh of Massachusetts, Robinson of Arkansas, and Bratton of New Mexico joined in the attack on the bill, declaring that this measure was the beginning of an effort to control the milk business through federal laws, when it was in every respect subject instead to state laws and regulations which ought not to be invaded.

The bill was defended on health as well as economic grounds by Senators Lenroot of Wisconsin and Copeland of New York but in spite of their defense and explanations the objections continued to such length that other business intervened, and the consideration of this bill was once more postponed.

The Agricultural Appropriation Bill had much clearer sailing and faster action in the Senate. It was passed January 5, carrying all of the extra items asked for by the American Dairy Federation, $21,700 in all for increased work in dairy research, including new building costing $6,700 at the Beltsville Dairy Farm. It is expected that the House will not oppose this very slight addition to the bill, as compared with the magnitude of many other items. However, as this is written the House has not acted on the bill.

The Dairy Bureau will receive, if the Senate amendments stay in the bill, the sum of $516,794 for the next fiscal year's work, as compared with $495,094 this year. There is no new work provided for specifically as the general authorizations are held to be sufficiently broad to cover most of the new research which has been suggested as needed at this time. The increase does, however, provide for a good extension of activities, particularly in breeding and feeding work, in research in the problems of powdered milk and ice cream manufacture, and in the chemistry and bacteriology of milk, having to do with both problems of transportation and the technic of by-product utilization.

Dr. T. C. Atkeson, Washington representative of The National Grange for the past eight years, retired from active connection with this organization January 1. He is succeeded by Fred C. Brenckman, former secretary of the Pennsylvania State Grange. Dr. Atkeson was given a testimonial luncheon by friends and associates in the business and agricultural organization work in Washington, Tuesday, January 4, about 100 being present at the Hotel Harrington, where an appropriate gift was presented to him, and he was named by Hon. Nathan B. Williams, representative of the National Association of Manufacturers, as the Emeritus Representative of American Agriculture in the National Capital. Dr. Atkeson will continue to reside in Washington.

Both House and Senate will be considering farm relief bills in the remaining weeks of the session, but without much of a chance of anything being passed. There is a whole crop of new bills, of all shades and kinds, but the only one which will get anywhere near the stage of a final vote will be the McNary—Haugen equalization fee bill. The chances favor this measure being reported favorably in both House and Senate.

The addition of Louisville, Ky., to the list of larger cities to put T. B. ordinances into effect, indicates the necessity of the T. B. appropriation of nearly $6,000,000 carried in the Appropriation Bill, at the insistence of the American Dairy Federation. This is the latest addition to the list of cities requiring T. B. free milk.

Wisconsin Dairymen

The Wisconsin Dairymen's Association will hold its 55th annual meeting at the College of Agriculture, Madison, on Tuesday, February 1. In his announcement, Secretary Burchard says:

"Every cow testing association should be represented at this meeting by one or more members and by its tester. A copy of the official badge is enclosed. Put it on today and help advertise. Wear it when you come to Madison.

"The meeting is held at the College of Agriculture during Farmers' Week so that you may kill two birds at one trip—attend our meeting and take in the other good things at the College.

"We have real dairy farmers on the program from each section of the state. They speak from experience and know what they are talking about. Mr. Conklin will bring to us a message of large import to members of cow testing associations, and you will want to hear him."

John—Do you know why Adam was one of the first radio fans?

Lewis—I'll bite, why?

John—He made a loudspeaker out of his spare parts.

A Texas Co-operative

(Continued from page 60)

the Southwest, puts out such a complete list of products.

Although the dairy has a full variety of products, it has not stopped growing as to quantity. The farms in the near valley supply milk for the whole milk, cream, and sweet cream butter trade, and the more distant points supply cream for creamery butter, but still the dairy cannot get enough to fill its orders. At present it is receiving sour cream from non-members who are 200 miles or more from El Paso. The outgoing products, chiefly butter and ice cream, are distributed over a territory 700 miles wide.

Almost all the 500 stockholders have been, or are now, producer members. On August 1, 1926, there were about 250 members sending milk, cream, or eggs to the dairy. The incoming milk averaged 3,600 gallons daily, which was an increase of 1,300 gallons daily over the receipts of October 1, 1925.

The quality of the incoming milk is improved by the carrying out of a contract recently entered into by the association and the trucking companies which bring the milk from the farms to the dairy. Formerly the trucks were unloaded in the order in which they arrived at the dairy. As many as six would arrive in a period of twenty minutes, and since it takes about twenty-five minutes to unload one of them, the others had a long wait in the famous El Paso sunlight, which is very warm sunlight, even in the very early morning. The result was that the milk in the trucks which stood longest deteriorated as to flavor and became an inferior product. Sometimes it was entirely wasted. The recent contracts provide that the trucks shall be at the loading places at specified times, and that the members shall load their trucks accordingly, so that the trucks shall arrive at the dairy only one at a time, with long enough intervals between so that the first can be unloaded before another gets there.

These trucks which haul the milk from the producer to the dairy are the only part of the equipment which is not owned by the association. The fleet of forty-five vehicles, including motor trucks and horse-drawn milk route wagons, are owned by the association and repaired and painted by the association employees in shops owned by the association. The painters in these shops also prepare advertising posters to be displayed at advantageous places, and paint wall signs.

Mr. H. F. Deitrich, the manager of the dairy, and his brother, A. F. Deitrich, the assistant manager, are graduates of the Texas Agricultural and Mechanical College, and have been associated with the dairy business since they were boys. These men, and more than a hundred other of the highest paid employees in the dairy products field of the Southwest, are handling the most successful co-operative dairy in that part of the United States. It proves that a properly financed and properly managed co-operative whose members have the habit of co-operating, is a sound business.

The yearly business handled by the Rio Grande Valley Dairy Association in 1921 was $150,000 while the fiscal year ending December 31, 1926, the dairy expects to do over $1,000,000 worth of business.

At the same time that the dairy has been getting its business stabilized and into working order, the dairy prices have been stabilized so that the farmers do not bid against one another for a marked outlet. This elimination of bidding against each other is especially fortunate because it gives the farmers around El Paso a chance to learn to work unitedly while the other industries of the section are new. Their united business grows up, so to speak, with the other industries and has a better chance to survive.

ATWATER KENT RADIO

The receiver illustrated is the extra-powerful Model 32, with ONE Dial; price, less tubes and batteries, but with battery cable attached, $140; Speaker, Model H, $21.

"ONE DIAL —just what I was waiting for"

"I WAS minded to buy a radio set, but those I had seen were too complicated. My wife and I didn't want to fuss over a thing that looked like the dashboard of an automobile. We didn't want *work*—we get plenty of that. We wanted to *listen*.

"Well, a couple of weeks ago, over at a neighbor's, we found what we were looking for. It was one of those Atwater Kent sets, with only ONE Dial. It looked simple, and was simple.

"When I got my fingers on that ONE Dial, it seemed as if I could go anywhere. I heard a lecture, a fiddling contest and a band concert in the first ten seconds—just by turning that ONE Dial. The band concert suited both families, so I let go the dial and stayed with it until they signed off.

"Then we rounded out the evening by getting the latest news from Omaha, and the next day's weather forecast from Des Moines. All we had to do was to shift the ONE Dial.

"The next Saturday I went to town and got a set just like it. It is even better than I thought it would be. It's what I call the real thing in Radio—just what I was waiting for."

That's what a Middle Western farmer told us. It's the same sort of story we are hearing from farmers everywhere. If *you* thought Radio was complicated—try *your* fingers on an Atwater Kent ONE Dial.

EVERY SUNDAY EVENING:—The Atwater Kent Radio Hour brings you the stars of opera and concert, in Radio's finest program. Hear it at 9:15 Eastern Time, 8:15 Central Time, through:

ATWATER KENT MANUFACTURING CO.
A. Atwater Kent, President
4769 WISSAHICKON AVENUE PHILADELPHIA, PA.

ATWATER KENT ONE Dial Radio is *the* Radio preferred by farm families. Surveys made by your own farm papers prove it. Drop in at any Atwater Kent home and see why. Mark the ease, speed and certainty of Atwater Kent ONE Dial operation. Note that this is a *real* ONE Dial—no secondary adjustments are needed—ONE Dial does it all. Note the true, natural tone of Atwater Kent Radio Speaker. Let your dealer show you how reliable Atwater Kent Radio is. Tested 159 times in our factory so that when it reaches your home it works and keeps on working. That's the way it's made.

Prices slightly higher west of the Rockies and in Canada

Model L Speaker, dark brown crystalline finish, $16.

Model 30, six-tube One Dial receiver, less tubes and batteries, but with battery cable attached, $85.

Model 35, six-tube ONE Dial receiver, shielded cabinet, less tubes and batteries, but with battery cable attached, $70.

Feeding Flaxseed

I have been advised to feed ground flaxseed to my cattle. I would like to have your opinion. This meal has a large quantity of oil in it.

Elverson, Penn. I. H.

Flaxseed is little used for feeding cows principally because the value of the oil in it makes the price prohibitive. The price received by producers during the past decade averages about $2.25 per bushel of 56 lbs. This makes the price around $75 to $80 a ton. The retail price would be considerably higher and in Pennsylvania this would be increased because of freight charges from the points of origin which are, so far as domestic production is concerned, Minnesota, North and South Dakota, and Montana.

There is little starch in flaxseed, its principal constituents being protein and oil. One had much better buy linseed meal, cottonseed meal, gluten feed and meal, and such like to supply protein. Carbohydrates are supplied much cheaper in corn, barley, hominy feed, and feeds of similar character.

Aside from the factor of cost, one would not find it advisable to feed very much flaxseed because of the extreme laxative eff[illegible] duce, besides t[illegible] digestive di[illegible] oil conte[illegible] product[illegible] more[illegible] it i[illegible] co[illegible]

Releasing man-power for the many other tasks, the STAR can always be depended upon to furnish ample water for all farm needs. Even in 8 to 10-mile breezes, you will find it on the job, day after day — *for years.*

Timken Tapered Roller, or No-Oil-Em bearings, running in oil, enable the STAR to get all the work out of light breezes, with a very small amount of attention. The famous GALVAZINK Coating, together with the fine mechanical features, means long years of perfect satisfaction.

of "Modern

Future of the Pure-Bred Business

E. PARMALEE PRENTICE, MASSACHUSETTS

MR. R. D. Canan, of the Indiana College of Agriculture, has performed a valuable service by calling public attention to the present critical situation of the dairy breeds, as he did in his article, "Registration of Pure-bred Cattle," published in Hoard's Dairyman on the 25th of November.

A year ago discussing in the New England Homestead the problem now before the dairy breeds, I said: "There is no magic in the pure-bred name. The magic is in the pure-bred achievement." These statements Mr. Canan puts at the head of his article and I think practical dairymen will agree. It is because they are commercially profitable that pure-bred animals are valuable and this is their achievement. The dairy breeds have been a source of breeding stock available to every dairyman to improve the productivity of his herd, and so well have they answered this purpose that their use has been universal, and the fields are full of productive grade cattle clearly marked with the characteristics of the different dairy breeds. In number the pure-bred animals are less than 5 per cent of all the dairy cattle in the country, but small as the number is, they are an essential factor in the success of American dairying. No dairyman whose herd lacks the marks of pure-bred influence can hold a place in the dairy business.

Now Mr. Canan calls attention to the fact that in the last ten years the increase in registration of pure-bred animals has not been as great as one would expect. This is very significant and deserves the attention of everyone. Producer and consumer are alike concerned. If registration of pure-bred animals, which have contributed so much to the progress of dairying and to public welfare, is less than it should be, it is well to know the cause of this falling off. Are pure-bred animals for any reason less efficient producers than they used to be?

On this question we have definite information. A letter recently received at Mount Hope Farm from the United States Department of Agriculture says:

"A tabulation recently made here of the cow testing yearly records of 12,830 pure-breds, and 34,031 grades of the dairy breeds, Ayrshires, Holsteins, Jerseys, and Guernseys, showed an average milk production of 7,667 lbs. for the pure-breds and 6,999 lbs. for the grades. The average fat production for the pure-breds was 296 lbs. and for the grades 281 lbs."

It seems, therefore, that the difference in productivity between pure-breds and grades is disappearing. We know that so far as production is concerned, there is no hard and fast line between the two. Many pure-breds produce less than grades and some grades rank with the best pure-breds. At the present time if the figures of the department be a fair measure of the average productivity of pure-breds and grades, the grades produce 91 per cent as much milk and 95 per cent as much butterfat as pure-bred dairy cattle. The department gives no figures on the comparative cost of feeding the cattle included in the statement, and the omission is important, for the small difference in productivity here shown could well be accounted for by a difference in feed. Very fortunately it happens that recent figures compiled in Wisconsin cover this point. The Wisconsin statement covers 7,285 pure-bred cows and 26,669 grades in 157 cow testing associations, during the period 1921-26, and shows that—

"The average production by the pure-breds was 7,677 lbs. with 291 lbs. fat, average test 3.8 per cent, and of the grades 7,004 lbs. milk, 290 lbs. fat with an average test of 4.1 per cent. The value of production came out at $146 per cow for both grades and pure-breds. The cost of roughage was $41 for the pure-bred and $39 for the grades, and grain $27 for the pure-bred and $22 for the grades. The returns over feed cost are therefore $78 on the average for the pure-bred and $85 for the grades."

It will be seen that the Wisconsin figures are not far from the figures of the United States Department of Agriculture and that in both cases the grade percentage of butterfat is the higher. The suggestion is strong that if it had been sound business policy to feed the grades at as much cost as appears to have been put upon the pure-breds, the expensive difference in amount of milk and butterfat produced might wholly disappear.

On the subject of the Wisconsin figures, Mr. Roy T. Harris of the Department of Animal Husbandry in the University of Wisconsin, says:

"It should be pointed out that the results are not uniform in all of the associations; in fact, in all but one of the groups of associations considered, the pure-breds show a substantial increase in production over the grade cows in the same association. In most cases they also show a higher feed cost and in four out of fifteen comparisons they show greater returns over cost of feed. The eleven out of fifteen show either substantially the same returns as from the grades or varying amounts less. These figures furnish food for thought and give an interesting sidelight on the development of dairy cattle in a dairy section. If the average production were lower we might feel that our pure-bred herds were deteriorating, but this can hardly be true with an average production of nearly 300 lbs. The facts appear to be that through rigid selection based on profitable production the grade herds have been improved to such a point that they can no longer look to the ordinary pure-bred herd for further advancement. They will have to look to the upper fraction of such herds for herd sires with which to make further progress."

This is very significant and far reaching, for when grade herds cease to look to "the ordinary pure-bred" for improvement, and are compelled to seek an extraordinary one, they take him when found not because he is pure-bred, but because he is extraordinary. The words "pure-bred" are beginning to lose their value and we face an individual competition among all cattle—pure-bred and grade together.

I believe that this comparative loss of position by the dairy breeds would in the end be an injury to the whole dairy business. All high production came originally from the dairy breeds, and it is to the general interest that these breeds should improve as grade cattle improve, always keeping the pure-bred standard so high that the dairyman can be sure of finding among the pure-breds the animals he can rely upon to improve his herd.

Is it impossible for the dairy breeds to keep this position which they have held so long? How does it happen that while improvement is going on, the pure-breds should be unable to make an average improvement as great as the grades? Mr. Canan answers this question by saying:

"A great many of our leaders believe that this condition is due to the fact that a great many of our registered cattle have not proven to represent all that should be represented in a registered animal. In other words, there are many demonstrations that conclusively prove that scrubs exist among our pure-breds."

There is the whole situation. And the scrubs get in among the pure-breds because there is no effort to keep them out. Pure-bred animals are registered on pedigree only with no questions asked about productivity. Then, since the tendency is to keep and use all registered females, we find that scrubs give birth to scrubs and the various pure-bred associations are loaded with inferior cattle.

With grade cattle the situation is quite different. Grades are bred for production only. They are kept for practical purposes and practical purposes dominate their breeding. There is no motive which leads a dairyman to perpetuate the blood of inferior animals and sooner or later these animals and their offspring disappear. As Mr. Harris well says, the improvement of the grade herds has been

(Continued on page 98)

MILLICENT OF WALHALLA.

Millicent is one of four Brown Swiss cows to finish good records at Walhalla Farms, New York. She produced 19,673.7 lbs. milk, 813.94 lbs. butterfat as a 5-year-old. The others are Rhoda of Walhalla, 13,363.5 lbs. milk, 576 lbs. fat; Ola's Daughter, 20,147 lbs. milk, 754.4 lbs. fat; and Annis of Walhalla 14,263 lbs. milk, 597.82 lbs. fat in 305 days—a world's record for all ages in that division.

P. A. revises all your pipe-ideas

TAKE that any way you like. If you have always wanted to smoke a pipe, but felt you didn't dare, Prince Albert will convince you that you *can* . . . and enjoy it! If you are already a pipe-smoker, but don't know the joys of P. A., this tobacco will be a revelation.

Beginners and old-timers alike are amazed that any tobacco can be so mild and still have that satisfying body that men demand in a smoke. They revel first of all in its fragrance, promise of a wonderful taste to come. And when they light up and pull in—ah . . . !

Buy yourself a tidy red tin of P. A. today. You'll find it cool, as a dip in the surf is cool. You'll find it sweet, with a sweetness that never cloys. You'll find it mild as Indian summer . . . a mildness that lets you smoke to your heart's content.

You may think your present brand is the last word in pipe-tobacco. Don't stop there. Be inquisitive. It will bear repeating: P. A. revises all your pipe-ideas. Make the test today—the only test that counts: a tidy red tin, a jimmy-pipe, and a match!

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

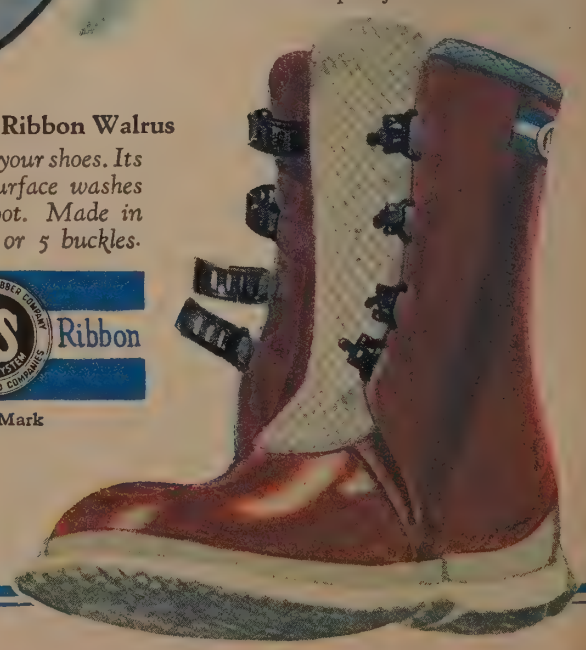
Months of Solid Wear

built into every "U.S." Blue Ribbon boot and overshoe

"U. S." Blue Ribbon *boots are made with sturdy gray soles. The uppers are either red or black—knee to hip lengths.*

THESE new "U. S." Blue Ribbon boots and overshoes are built to give the longest wear a boot or overshoe can give.

They're made with a thick, oversize sole—tough as an automobile tire. In the uppers is put rubber *live as an elastic band*—so that constant bending and wrinkling won't crack or break it. The reinforcements are the strongest ever used in boot construction. They give you all the rugged strength you need.



"U.S." Blue Ribbons will give you a new idea of how much wear can be built into a boot or overshoe. They'll stand the wear and tear. You can depend on them every time. And they've got all the flexibility and comfort you could ask for. Try a pair *and prove it!*

United States Rubber Company

FIVE TIMES ITS LENGTH! *That's how much you can stretch a strip of rubber cut from any "U. S." Blue Ribbon boot or overshoe. It resists cracking or breaking—stays flexible and waterproof.*

The "U. S." Blue Ribbon Walrus
slips right on over your shoes. Its smooth rubber surface washes clean like a boot. Made in red or black—4 or 5 buckles.

The Minnesota School of Agriculture

E. C. TORREY, MINNESOTA

THE work of the Minnesota School of Agriculture at University Farm, St. Paul, has several stinguishing characteristics. At ast two of them were unique when troduced several years ago. One bstituted the illustrated address or

D. D. MAYNE, PRINCIPAL OF THE MINNESOTA SCHOOL OF AGRICULTURE FOR 22 YEARS

vid demonstration of subject matter arned in class rooms for the essay the sweet girl graduate and the set scourse of her big brother. The her added the home and community oject to the course of study.

Commencement Day at the school is re again. Attendants have silently d swiftly arranged the properties, d Erhardt Bremer of Lake City kes his stand amid various charts, pliances, and chemicals to demonrate his subject, "Sawdust as Cattle ed." Citing the tremendous inease in the world's population he oks ahead to the time "when Necesty, that hard master, will make us ed our live stock on sawdust, seaed, or any seemingly waste aterial."

"This small quantity of sawdust," says, while sifting it through his gers, "has been treated with sulphuric acid and put under pressure of .5 to 120 pounds per square inch. he acid acts on the cellulose or ody fiber of the sawdust, causing to unite chemically with a definite amount of water, thus forming glucose sugar which is two-thirds as sweet as cane sugar and furnishes the animal with heat and energy. When the acid liquors have been removed by centrifugal force and repeated washing in hot water, a product is revealed that is slightly sticky with glucose and is highly relished by animals."

Results of experiments at various stations are given to show that dairy cows maintained their production and weight when this treated sawdust was used in their ration.

"If your taxes are high," says the Commencement Day speaker to the disgruntled taxpayer, "it is because you voted to make them so at your annual town meeting. Taxes have been raised in the last few years because we are depending on the government to do much that we have done for ourselves in the past. Taxpayers call upon the government to give their children a more complete education. Then they kick about paying the bill."

The Minnesota School of Agriculture has one principal objective—to fit young men and women for successful farm life and useful citizenship. They enter the School of Agriculture after completing the eighth grade or the course offered in the rural school and these are comparable to those taken in high school. It must be kept in mind that this School of Agriculture is not the College of Agriculture. The school course runs for three years and provides for the study of English, mathematics, chemistry, physics, agriculture, and home economics for six months of each year at University Farm and for two six-month periods of supervised farm home or community project work, the purpose of which is to give the students opportunity to apply their classroom training in the actual operation of a farm or a farm home or the organization of an enterprise for the betterment of the neighborhood.

The Minnesota school was the first in the United States to develop the "project" as a definite and integral part of the school curriculum. This is no make-believe affair. The project work, like the class work, is under the immediate supervision of members of the faculty who visit the students regularly through the spring and summer to give instruction and check up on the progress made or lack of progress. The student is never out of school. What has happened is that he has taken his studies from the classroom and the campus to his chamber in the farm home and to the fields constituting the farmstead. He knows he is "under fire" all the time and that he simply has to make good.

Much of his home project work is for some form of rural community betterment. The girls organize and train guilds and clubs of younger girls or form dramatic societies of the young farm people in the community. Public socials are held and plays staged, the proceeds of which are usually spent for town and village improvements. The boys promote cow test association work, lead junior clubs, organize and coach baseball nines, revive a moribund farmers' club, or prepare a township booth for the county fair. Rural life is quickened and brightened by enterprises set in motion by these young folks from the farm school.

Graduates of the school number about 3,800. Many of them have reached commanding positions in world activities.

D. D. Mayne, formerly of Wisconsin, has been principal of the school for 22 years and introduced the demonstration in commencement programs.

ERHARDT BREMER DEMONSTRATING HIS TALK ON "SAWDUST AS CATTLE FEED"

Goats in the Silo

HOARD'S DAIRYMAN:—Due to early d continual fall rains in our section Illinois, our silo ring experienced e problem of filling the silos with rn cut entirely by hand. This cessarily entailed considerable more ne and labor than in an ordinary ason when binders are used. The lds were so soft that only small ads could be hauled, thus necessitatg more wagons and men to handle e corn. Even then operations moved wly enough because of the mud. e men cutting the corn also had eir troubles, not only because of the d, but the winds and the rains had n much of the corn flat and twisted. Because of the extra labor required veral men decided to use Angora ats for the tramping process in the o. Two men in the neighborhood had already used goats for this purpose for the past two years, and were pleased with the results. So with the idea of saving the tramping labor, several other members of the silo ring decided to use the goats this year also.

It was found that in a small silo of 10 to 12 feet diameter, one man to run the conveyor pipe and another to attend the goats were all that were necessary. This eliminated the work of at least two men. In the larger silos of 14 to 18 feet diameter, it was found best to use three men, one to run the conveyor pipe and two to attend the goats. The work of at least three men was done away with in the larger size silos. The main job of the "goat-herder," as he became known, was to keep the goats moving about near the wall of the silo, tramping and packing the silage in the process. In the smaller silos, 6 to 8 goats did this work fine. In the larger silos 12 to 14 goats were used, divided into two bunches for better handling. Where filling is incompleted at the end of the day's run, the goats are simply left in the silo overnight. They drink very little water and the corn is their feed.

Goats used for the tramping and packing in the silo should have horns, so that they can readily be let down from the top of the silo with rope and pulley when filling is completed. They can be bought in most any live stock market at a nominal price. They should be active and not very old, it being a good plan to change every year or two. From the results of this year's experience in saving labor and the excellence of the work performed, goats have become popular in our silo ring and undoubtedly will be used again next year.

PAPEC

"The Cutter That Does Not Clog"

THE light-running Papec is just the Cutter for home and neighborhood filling. It requires less help and less power than any other cutter of equal capacity.

The entire feeding mechanism is now so nearly human in action that a man is no longer needed at the feeding table. Given suitable power, the Papec never clogs under *any* load or *any* silo.

Simple, rugged construction assures long life with few repairs. Many are giving good service after ten years' heavy use. Every part is easy to get at and adjust. There are no worries and no delays when you get a Papec on the job. Built by men who have specialized in Papec construction for 25 years.

Our 1927 Catalog describes four sizes of Papec Cutters and shows how a Papec will pay for itself in one or two seasons. Write for your copy today.

DAIRY MARKET NEWS

December Foreign Butter

The following table of December foreign butter prices gives the average of weekly quotations as published by the U. S. Department of Agriculture:

Market	Dec. 1926	Nov. 1926	Dec. 1925
	Cts.	Cts.	Cts.
New York	54.7	50.6	49.2
Chicago	52.5	48.9	47.4
Copenhagen	37.1	34.9	36.5
Berlin	39.3	36.9	36.7
London:			
Danish	40.2	37.6	40.9
New Zealand	36.8	32.3	38.1
Australian	36.2	31.4	35.7
Argentine	32.2	29.9	31.6
Siberian	32.7	28.3	31.4

December Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers for 3.5% milk delivered at factories during December is based on reports made by condensed milk and evaporated milk firms:

Geographic sections	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.34	$2.34
Middle Atlantic*	13	2.37—2.75	2.63
E. No. Central	79	1.95—2.40	2.21
W. No. Central	6	1.92—2.20	2.09
North Western	7	1.75—2.13	2.04
South Western	10	1.70—2.10	2.01
United States	116	1.70—2.75	2.22

*Fifty-three additional factories reported prices to be based in part on the current month's wholesale butter quotations. Twenty-six factories reported prices not determined, and twenty reported plants closed.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for November:

	Range	Ave.
Condensed, per case	$5.60— 6.55	$ 6.00
Condensed, per cwt.	9.38—13.00	10.09
Evaporated, per case	3.75— 5.05	4.32
Evaporated, per cwt.	7.50—10.00	8.90
Condensed skim, per cwt.	4.55— 9.00	5.83
Evaporated skim, per cwt.	2.75— 5.38	3.87

November Dry Milk

(From Report by U. S. Dept. of Agriculture)

The wholesale prices given below are based on reports from manufacturers governing actual sales f. o. b. factory during November.

Dry Skimmilk: Prices ranged from 7.5 cents to 13 cents for dry skimmilk in bulk, averaging 9.8 cents a pound for sales, totaling 5,997,659 lbs. When packed in one-pound cans the price reported was 32.5 cts. a pound.

Dry Whole Milk: Prices ranged from 21.5 cents to 28.5 cents for dry whole milk, averaging 24.5 cents for sales totaling 565,181 lbs. When packed in one-pound cans the price reported was 48.5 cents a pound.

Dry Buttermilk: Prices ranged from 7 cents to 10.5 cents for dry buttermilk in bulk, averaging 9.3 cents a pound for sales totaling 1,186,879 lbs. When packed in one-pound cans the price reported was 10.4 cents a pound.

Connecticut January Milk

The Connecticut Milk Producers' Association announces the following prices for Grade B milk delivered during January at market milk centers:

All milk sold in fluid form, 9.5 cents per quart for 4 per cent milk, and 4 cents per point allowed for other tests; all milk made into cream that is sold in fluid form, ten cents per pound fat above the average monthly price of 92-score butter on the Boston market; all milk made into butter, at a price per pound fat equal to the month's average on 92-score butter in Boston.

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on Jan. 1, figures being given in thousands of pounds (000 omitted):

	Jan. 1 5-yr. av.	Jan. 1 1926	Jan. 1 1927
	lbs.	lbs.	lbs.
Butter, creamery	44,802	52,785	34,355
Cheese, American	43,704	58,457	54,495
Cheese, Swiss	7,320	8,958	8,394
Cheese, Brick	1,833	2,347	1,799
Cheese, Limburger	1,022	1,449	1,626
Cheese, all other	5,773	5,438	5,606
Eggs, case	1,372	1,683	1,111

These holdings include stocks in both cold storage warehouses and packing house plants.

December Cheese

Cheese prices on the Wisconsin Board ruled steady, registering an advance of one cent during the month. The average for December on Single Daisies was 24.8 cents, as compared with 23.8 cents a year ago. During the forepart of January prices were steady and unchanged at 25.25 cents, with the terminal markets firm and unchanged. Total storage on January 1 was four million pounds less than a year ago, but is eleven million pounds in excess of the five-year average.

Cheese production for the first eleven months of 1926 was 394,975,000 lbs., a decrease of 14 million pounds from that of 1925. Net imports were greater by 17 million pounds, and the total storage holdings were a half million pounds less on November 30 than a year previous. The net result was a trade output, or consumption, of 455,456,000 lbs. cheese for the first eleven months of 1926, or 1.4 per cent greater than for the same period in 1925.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market:

	Dec. 1926	Nov. 1926	Dec 192
	Cts.	Cts.	Cts
Twins	24.5	23.4	23.
Single Daisies	24.8	23.9	23.
Longhorns	25.7	24.3	23.
Square Prints	26.5	25.5	25.
*Receipts since Jan. 1	195,358	180,232	211,70
*Receipts for month	15,126	15,332	13,46
*Storage (end of mo.)	16,598	18,941	23,45

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—00 omitted.)

December Butter

Butter prices in December at New Yor advanced from 53.5 cents to 56 cents, the just prior to Christmas, dropped suddenly t 52 cents and closed the month at 54 cents The daily average for the month was 54. cents, which was 4 cents above Decem ber, 1925, and 5.5 cents above 192 While demand appeared to clear the ma ket at these prices, dealers seemed ner ous toward the close of the month with fe of imports and the possibility of increasir production.

This unsettled condition continued into Ja uary and by the tenth butter had dropped 49.5 cents in New York. Market reports i dicate supplies in excess of demand, but th does not seem in accord with the report th the receipts of butter at the four large ma

Butter averaged 54.7 cents in December, the highest monthly average since December of 1920. Despite this sudden rise, which was lost in part at the close of December, the monthly average for the year was 44.4 cents. This is one cent under the average for 1925 and two cents above the 1924 average.

kets for the first twelve days of January were two million pounds less than for the same period last year. Added to this is the fact that the report on cold storage of butter on January 1 shows 18 million pounds less than a year ago and ten million less than the five-year average on January 1.

While the government weekly report for January 8 states that all four markets are very weak and unsettled, it also reports a good demand. The lower price is doubtless due to "bear" sentiment that prices were too high to maintain a good movement of butter into consumptive channels. To one on the fence and inclined to optimism, it would appear that by the close of January prices should strengthen somewhat and possibly approach those of December but not exceed them.

The total production of creamery butter for the first eleven months of 1926 was 1,257,252,000 lbs., which is 13 million pounds less than for the same period in 1925. Net reports were one-fifth of the previous year and the total storage holdings were nearly 10 million pounds less on November 30 than on the same date a year previous. The trade output, or consumption, was 1,789,592,000 lbs., or 1.5 per cent less than the same period of eleven months of 1925.

Daily quotations from the U. S. Department of agriculture show the following average wholesale prices on 92-score butter (extras) at four of the principal markets, together with receipts and storages:

	Dec. 1926	Nov. 1926	Dec. 1925
	Cts.	Cts.	Cts.
Chicago	52.5	48.9	47.4
New York	54.7	50.6	49.2
Boston	53.7	48.4	49.2
Philadelphia	55.7	51.9	50.0
*Receipts for month	35,141	33,291	34,904
*Receipts since Jan. 1	558,334	523,193	558,922
*Storage (end of mo.)	19,620	36,207	25,619

*In thousands of pounds at the four markets (i. e.—000 omitted). Ninety score butter averaged 48.7 cents for December in Chicago, with centralized butter at this market selling for 48.6 cents. Jobbers' prices on extras sold to retailers averaged 55.1 cents in Chicago, spread of 2.6 cents above wholesale.

Wisconsin December Condensery Prices

Fifty condenseries reported to the Wisconsin Department of Markets the prices paid in December per hundred pounds milk delivered at their factories. Reduced to a common 3.5 per cent test basis, these prices ranged from $2.06 to $2.45, the average being $2.21. This is 7 cents above the previous month.

Thirteen factories sent delayed reports for November, the average being $2.23. This is 9 cents above the previously reported average of $2.14 for 45 factories.

Wisconsin November Butter

Wisconsin co-operative creameries paid producers a net price of 56.1 cents a pound for butterfat in November according to reports from 95 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 50.4 cents a pound for butter, making a spread of 5.7 cents between the price received for butter and the price paid for fat.

The range of prices paid for fat was from 49 to 62 cents, with the price received for butter ranging from 48.2 to 58 cents. The overrun ranged from 21.2 to 25 per cent. Receipts of butterfat averaged 18,652 pounds per creamery.

Milwaukee December Milk

The Milwaukee Co-operative Milk Producers announce the following prices for the month of December:

For the portion sold as fluid milk, $2.90 per cwt.; and for the portion manufactured, $2.26 per cwt. These prices apply to 3.5 per cent milk delivered f. o. b. city, four cents being added or subtracted for each one-tenth of one per cent variation in test. Seventy-three and five-tenths per cent of the total receipts were sold as fluid.

Philadelphia Milk Prices

The Inter-State Milk Producers' Association announces that the January basic price for milk will be $3.29 f. o. b. Philadelphia and $2.71 per hundred at receiving stations in 51—60-mile zone.

The December surplus prices were $2.77 first surplus f. o. b. Philadelphia and $2.19 at all receiving stations on railroad.

These prices are based on milk testing 3 per cent butterfat with a differential of 2 cents for each half point of test up and down.

New York's Milk Problem

Ten Eyck Committee Holds Hearing

HOARD'S DAIRYMAN:—There are two committees in New York State having to do with better organization of milk producers. One of these may be called the Ten Eyck committee and the other the Dillon committee, because these men are chairmen of their respective committees. The former committee has just held a hearing of two days and will hold another later. This one is composed of representatives of all groups while the Dillon committee represents only three of the groups. The Ten Eyck committee is going to the foundation of the matter and will have information that will form groundwork for some definite conclusions. It will not consider a form of organization until the information is at hand.

At the hearing there were several from the College of Agriculture, specialists in their respective lines. It was remarked by the committee that the figures show that the dairyman is either getting practically nothing for his work or is receiving nothing as interest. The cost of producing is pretty well determined and the chairman thinks that it cannot be lowered as an average on large numbers of farms. Whether the retail price can be elevated was not fully determined, but there seemed to be some evidence that it may be raised a little if handled properly. Then there remains the question of lowering the costs of distribution. On this point I am sure that the hearing thus far shows that it may be done. Professors of marketing, milk handlers, and producers who were present seemed to practically agree on this point,—and the dealers were no less than President Fox of the Borden Company and V. A. Hovey of the International Ice Cream Co.

An investigation by the college shows that right in our best producing section there were 56 plants where a careful survey made it plain that 22 might have accommodated all concerned as well. This was by the college. Mr. Fox mentioned two plants that were handling a hundred thousand pounds of milk a day each with five men in each plant to do the work. He also mentioned 45 plants handling substantially the same amount of milk as these two but with 126 men being required to do the work. One farmer organization to do the selling could eliminate vast costs in the way of distribution it would seem. Both milk dealers who presented facts and opinions favored farmer organization but both seemed to think that there is need of co-operation between dealers and the organization.

It was interesting to study the men and the evidence. There was every appearance of sincerity not only on the part of the committee but those who presented information. As I see it they are following the only course that can mean definite results. Some four committees have tried to work out something before. Now it is the aim to get ample information upon which to base recommendations. The Dillon committee has been invited to listen and to present information if ready to do so. No arguments are expected between groups but facts are welcomed. The whole situation seems to be well handled.

Among the many whom it is expected will be heard later, are some one from the Sheffield Company, Mr. Halliday of the Sheffield producers, Professor Myers who has just spent a year studying co-operation in Europe, Mr. Dillon, Mr. Fox of the Bordens, the president of the Milk Conference Board, and other dealers. Some other co-operatives will be studied in some way. Producers are to be heard if they will present something of interest as no doubt they will, and the list is not yet exhausted.

New York. H. H. LYON.

Uncle Ab says if you must kick, apply it where it will do the most good.

What's Left Over

After every big dinner, or after the preparations for a holiday or for a lot of company have been completed, there are dabs of this and that left over that can be used to good advantage on the succeeding days. Upon looking into the cupboard on the day following such preparations, there may be found bits of cooked or uncooked meat, some vegetables, potatoes, cake, cooked cereal, egg-yolks or egg-whites, ends of bread, sour milk or some sour cream.

"Not enough for the table and too much to throw to the chickens," says the housewife, and the food is set back into the cupboard again, perhaps until it spoils and is lost. Unless we take time to think of some way in which these ends may be saved, they will stand around taking up space, spoil, contaminate other food, and will finally have to be thrown out.

It is a good idea to have in mind a list of things that left-over foods can be converted into, and in this use of foods, women most often request help. There are many new and interesting dishes that can be made from left-over foods, and the family usually likes them as well or better than the original dishes. The addition of the convenient casserole and the deep fat frying basket to our kitchen equipment is especially helpful in the making of attractive things from left-overs.

In almost every case, meat when purchased in a larger quantity is much cheaper, because some of the cheaper meat is sold with the good part of the cut. The same we experience when we cut a ham. We know that there are just so many fine slices of ham and then there are sure to be some ends, some trimmings, and finally the butt. It is much better to plan to have a casserole meat dish when these ends are left over than it would be to plan to have one when a nice fresh slice of ham must be cut to make it.

No matter what kind of meat or vegetable is used, the foundation recipe for a souffle or a croquette is always the same. When once these basic recipes are learned it is an easy matter to adapt whatever there happens to be left over to fit the evening meal. When meat is the left-over food in question, it may be turned into the following things: It may be combined with mashed potato, bread crumbs, or cooked cereal and made into meat balls, escallops, casserole dishes, hash, loaf, or it may be combined with vegetables and made into a salad, souffle, sandwiches, soup, or a meat pie.

When ends of potato or other vegetable are left over, they may be combined with cream sauce and cheese and made into au-gratin or escallops, fritters, soups, salads, and souffles.

Cooked cereals immediately suggest fried mush. We are so fond of fried mush in our household that we always plan to cook some extra so that there will be some left over to fry. I know there are many households that do the same. But when there is just a little, not enough to fry, just try and substitute it for bread or potatoes to line a casserole dish or mold it in cups and serve it with fruit juice and cream as a dessert. It can be used very nicely to stretch the flavor of meat in making meat balls or meat croquettes. Or, it may serve as a substitute for flour in making muffins, pancakes, cookies, or as bread in making stuffing, or take the place of some other cereal in soup.

Bread crumbs are so convenient for use that it is indeed unfortunate to find that the crock in which they are always kept has been completely emptied. They may be used with meat or vegetables for stuffing, for making croquettes, cutlets, escallops, meat or vegetable loaf, puddings, muffins, and griddle cakes.

Fruits and fruit juices are so very popular that there are seldom any left over. When there are any they can quickly be turned into some kind of dessert or into a cocktail. When there is only one peach, we can still have peach cobbler, and when there are only a few berries and some good juice, we may have some good gelatin dishes, a salad, some frozen dessert, or a pudding.

Sour milk will make cottage cheese, cake, cookies, steamed breads, hot biscuits, and griddle cakes, and sour cream will make the best slaw, salad dressing, cake, or cookies.

Egg yolks left over after making angel food cake have been probably one of the hardest problems in the kitchen. But there are ways in which they may be used to great advantage and my favorite way is making a chocolate frosting for which I will give the recipe, because I think it is quite an unusual one, and the very best I know how to make.

To make it three egg yolks are used. Two ounces of bitter chocolate are melted over hot water. When melted it is beaten into a mixture of ½ cup of milk, 3 egg yolks, and 1½ cups of sugar which have been beaten together and allowed to boil until thick. This frosting is soft but not sticky when it is cold and it can be piled on the cake quite high.

Some of the egg yolks can be used in making custards, mayonnaise, boiled dressing, cookies, gold cake, potato stuffing, potato cakes, croquettes, and meat loaf. The whites are always welcome in making toppings, frostings, cakes, and pies.—S. K. ORMOND.

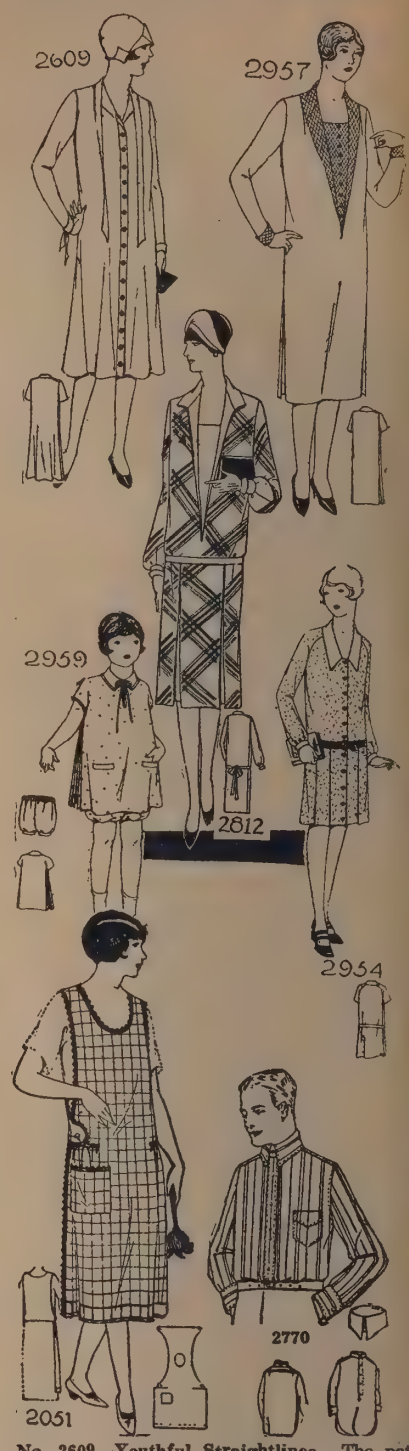
CONVENIENTLY ARRANGED FARM KITCHEN IN THE MODERN HOME OF MRS. W. P. JONES, INDIANA

Note especially the amount of light in the corner of the kitchen where the most of the work is done.

The Kitchen Bulletin Board

Did you ever hear of a kitchen bulletin board? It is a new idea to many but is of untold value to any housekeeper. A large board of any size will serve the purpose, although one of soft wood is preferable so that push tacks may be used easily to hold the lists in place. Or, it may be a large square of heavy burlap enclosed in a large picture frame. Pins may be used on this to hold the various papers in place.

You hear a great deal about budgeting your income, and you hear a little about budgeting your time, but my idea is to do a little budgeting of a great many things. And then I post these budgets or lists upon my bulletin board in the kitchen, where I can study them a great many times a day. Every housewife will concede that work runs smoothest when it is well planned. Therefore, I plan my work upon paper, using small pads of scratch paper for the purpose. I make a list of the work for the whole week ahead. Probably it reads like this—Monday, wash and iron. Tuesday, bake, mend, and darn. Wednesday, make Margy's crepe dress. Ladies' Aid in P. M. Thursday, clean upstairs, dentist, etc. Budget your work, and if you have a maid, budget her time and work for each day. You will achieve almost twice as much and so will she. She may not like it at first but it will accomplish wonders in the end.



Make a memorandum of the groceries you must buy for the week, the material you wish to purchase for sewing, the patterns and trimming you need, or perhaps it is bread pans and paring knives.

I always list the sewing I have to do, both in spring and fall. I make a separate list for each member of the family, first of the clothes he needs, second what part of it is to be purchased, and third that which I must sew for him. I do likewise for the household articles, such as bedding, linens, curtains, towels, etc.

And as I purchase or finish an article on any list, I check it off. In

(Continued on next page)

Miscellaneous Fashions

No. 2609—Youthful Straightlines. The pattern cuts in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3¾ yards of 40-inch material.

No. 2957—Slenderizing Lines. The pattern cuts in sizes 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 2¾ yards of 40-inch material with ¾ yard of 32-inch contrasting.

No. 2812—Slenderizing Lines. The pattern cuts in sizes 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 2⅞ yards of 40-inch material with ¾ yard of 40-inch contrasting.

No. 2959—Bloomer Dress. The pattern cuts in sizes 2, 4, 6, and 8 years. Size 4 requires 2⅜ yards of 36-inch material with ⅜ yard of 18-inch contrasting and 2 yards of binding.

No. 2051—Attractive Apron. The pattern cuts in sizes small, medium, and large. The medium size requires 2 yards of 36-inch material.

No. 2954—Ragland Sleeves. The pattern cuts in sizes 6, 8, 10, 12, and 14 years. Size 8 requires 1⅞ yards of 40-inch material with ⅜ yard of 32-inch contrasting.

No. 2770—Men's and Boy's Blouse. The pattern cuts in sizes 12½, 13, 13½, 14, 14½, 15, 15½, 16, 16½, 17, 17½, 18, 18½, and 19 inches neck. The 15½ inch size requires 3½ yards of 36-inch material.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Hoard's Dairyman patterns cost only 10 cents each. If you are buying any patterns it will save you money to buy from us. Fashion Magazine also only 10 cents.

this way I can always tell just what is left.

Many plan their whole week's menus out ahead of time and post them for the week. I always plan menus for guests and thrashers and keep them in sight, so that at the last moment I can tell at a glance whether I have everything ready and on the table or not. My aunt entertained forty at Christmas dinner last year, and about four o'clock in the afternoon she cried, "Oh, girls, what do you think I've done? I forgot all about those four pans of dressing that I made yesterday and set away for dinner."

Lists are such a help at Christmastime. My mother painted china for years and always gave away great quantities of it at Christmas. Everyone marvelled how she could remember just what she had given and never duplicate a dish, and many times give piece after piece in the same pattern. The secret of it was that she kept a booklet in which year after year she wrote whom she gave to, just what she gave them, and what decoration she had put upon it.

Memorandas of housecleaning are invaluable. I plan out just what order I will take the house in, how long it will take me, how much I will do each week, and what I will add extra to the washing each time.

Another suggestion I heard over the radio recently was to plan out the children's school lunches for the week ahead, and I believe this is an excellent plan. In this way we may vary the lunch from day to day and the children will enjoy it more. The children will be eager to find what new treat there is hidden for each day.

If you do not have a bulletin board in your kitchen to hold all these numerous lists, they will soon be lost and useless. By all means, have your husband or son make you one some evening soon. And often in the corner of mine I keep a cheery verse, a brave little motto, or a small picture I have treasured, even though it is only one cut from some magazine.—ETHEL MORRISON—MARSDEN.

The Imaginative Age

"Oh, mother, a big bear chased me into the house, and our house was burning as I passed the corner of father's bedroom."

Have you ever had such reports from your four-year-old, or even from the seven-year-old?

I had heard so many mothers say it had been such a hard problem to teach the kiddies the difference between truth and imagination, so when my little girls began to talk I began to wonder just what the task might be for me, and just how I could teach them to distinguish between fact and fancy. I early resolved not to punish them for the "stories" they might tell me, until I was sure they were old enough and really trained to know "really true stories" from "play stories."

First I decided to take myself in hand and learn more about the workings of the mind of the normal child that I might work with nature rather than against nature. It is natural for the active, healthy child to have a highly imaginative mind. I soon learned my girls were perfectly normal in this respect.

We made a game out of it. They enjoyed sitting by my side whenever I sewed at the machine, mended the clothes, ironed, prepared the vegetables for the meals—in fact they sometimes liked to sit so near me that it was difficult to do the work at hand, but those were times when we had great talks. So as long as they were willing to sit still, I tried to make the most of the opportunity to play the little games that I hoped would teach them to be truthful, and at the same time make them feel that mother understood.

"My house is a brown bungalow with a room for mother and daddy, and a room for sister and me; it hasn't any kitchen—we go out for all our dinners," and the five-year-old would ramble on telling about the house of her imagination, until the four-year-old would pipe up, "Every room has a stairway in my house—don't you wish you lived in my house?" Then I would enter into the game with a remark, "And my house has glass floors." How they would laugh when mother added a bit to the make-up story, but they very quickly inquired, "Well, mother, how can we play in your house—we would break your floors?" The opportunity I wanted was mine—a chance to throw in a little information about real things and make-believe things.

"Aren't you glad that was just a 'play' house? Mother's 'real' house has solid floors of wood that her little girls can play upon. Now let's talk about our real house." Then we described our own little cottage just as the girlies knew it to be. When

(Continued on next page)

No. 2848—Slender Lines. The pattern cuts in sizes 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 3⅝ yards of 40-inch material.

No. 2950—Youthful Sports Dress. The pattern cuts in sizes 16, 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 4 yards of 40-inch material.

No. 2956—Jabot Dress. The pattern cuts in sizes 16, 18 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 2⅞ yards of 40-inch material with 1 yard of 40-inch contrasting.

No. 2955—Bolero Frock. The pattern cuts in sizes 14, 16, and 18 years, 36, 38, and 40 inches bust measure. Size 36 requires 3 yards of 40-inch material with ¾ yard of 36-inch contrasting and ¾ yard of binding.

No. 2953—Morning Dress. The pattern cuts in sizes 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 3½ yards of 40-inch material with ¼ yard of 6-inch material for vestee.

No. 2942—Smart Plaited Model. The pattern cuts in sizes 6, 8, 10, 12, and 14 years. Size 8 requires 1⅞ yards of 40-inch material with ⅜ yard of 32-inch contrasting.

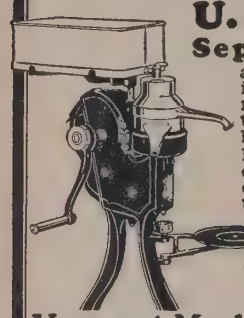
No. 2884—Surplice Closing. The pattern cuts in sizes 16, 18 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 3⅝ yards of 40-inch material with ¾ yard of 36-inch contrasting.

No. 2321—Straightline Styling. The pattern cuts in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3⅝ yards of 36-inch material.

No. 2718—Junior Frock. The pattern cuts in sizes 6, 8, 10, 12, and 14 years. Size 8 requires 1⅞ yards of 32- or 36-inch material with ⅝ yard of 36-inch contrasting.

No. 2312—Attractive Apron. The pattern cuts in sizes 36, 40, 44, and 48 inches bust measure. Size 36 requires 2⅝ yards of 36-inch material.

No. 2951—Smart Plaid Woolen. The pattern cuts in sizes 6, 8, 10, 12, and 14 years. Size 8 requires 1⅝ yards of 40-inch material with ½ yard of 40-inch contrasting.



All patterns ten cents. Send to Hoard's Dairyman Pattern Department, Fort Atkinson, Wis.

Butter Must Look Good— Be Appetizing

"Dandelion Butter Color" gives Winter Butter that Golden June Shade

Just add one-half teaspoonful to each gallon of cream before churning and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless, and meets all State and National food laws. Used for years by all large creameries. Doesn't color buttermilk. Absolutely tasteless. Large bottles cost only 35 cents at drug or grocery stores. **Write for FREE SAMPLE BOTTLE.** Wells & Richardson Co., Inc., Burlington, Vermont.

Dandelion BRAND Butter Color

It Gets All the Dirt

Puts Your Milk in the Grade "A" Class

It's impossible for anything but milk to go through Dr. Clark's Purity Strainer. It absolutely removes all the dirt, dust and sediment at one straining. That's our guarantee and money back if it fails. No other strainer on the market carries such a guarantee. World's largest condensaries such as Borden's, Van Camp's, Mohawk, Carnation, etc., use and endorse the Purity Strainer. Recommended by the U. S. Government. Thousands of farmers wouldn't be without it. Neither will you once you use it. Most sanitary strainer made, simplest to use, easiest to clean. Saves time and labor; lasts a lifetime. Ask your dealer. If he hasn't it, send direct to us for literature, sizes and prices, giving your dealer's name.

Dept. Q, Battle Creek, Mich.

an imaginative idea slipped in, I would say, "Oh, no, that was in the 'play' house—we are talking about the real house now that we are living in." They got the idea quickly. The topics varied, but I always managed to get around the fact or fancy explanation after we had had our fun with the stories.

When they came to me with remarks, I would listen and show my interest in whatever they told me, and then ask, "Was this play or real?" Very soon they made the distinction and could tell me correctly. But I displayed as much interest in their play ideas as in their ideas about real things. As soon as I had distinguished for them or led them to make the distinction for themselves, I showed them that I was truly interested in whatever they had to tell me. I was never shocked at anything they told me, or at least I never allowed them to feel that they had shocked me.

One day Lillian came to me saying, "A big cat caught two little chickens while I was playing in the sand pile." I did not know how true it might be.

"We must get that cat and look after the other little chick—was it a 'play' cat or a really truly cat?" I inquired of my little four-year-old girl.

"Mother, I think it was a really truly cat—let us go out and see."

We went out and I counted the chicks. Not a one was missing. No cat was in sight. I did not scold her. We just laughed and had a game. "Why, the cat has brought them back," I said. "Real cats do not do that but play cats do—it must have been a 'play' cat. We will have to watch for that 'play' cat—we do not want him to worry girlies' mothers and baby chicks any more."

A few days later she hurried into the house to tell me Gretchen, the Police dog, had broken her chain. I looked startled, but she quickly informed me it was a 'play' Gretchen that had been naughty, that real Gretchen was a good dog.

I do not believe my girls have been very different from other children. I think I simply took the time to understand their little minds and to enjoy their imaginative ideas with them, and by making a little game of it and allowing my own imagination to mingle a bit with theirs, I have taught them to know the truth. My girls are now nine and ten years old. They have not been the problem I feared they might be when I listened to other mothers tell of the "lies" their children had told. Perhaps had I called my girls' stories "lies," I, too, might have found myself miles away from them in sympathetic understanding and unable to guide them in their first encounter with fact and fancy. But as it is, I think we have safely passed the imaginative age and because of our understanding of each other's interests, we are better prepared for that next difficult time—the adolescent period.—(MRS.) W. R. CURRY.

Wisconsin Homemakers' Week

Has mother had a vacation recently?

A trip to Madison during Wisconsin Homemakers' Week, Jan. 31 to Feb. 4, will give her a happy holiday.

Believing that all work and no play is as bad for mother as for anyone else, many plans are being made to insure the women who go to Madison a happy time as well as a profitable one, according to Mrs. Nellie Kedzie Jones, head of Home Economics Extension at the Wisconsin College of Agriculture.

The luncheons for the out-of-town visitors at the homes of the Daughters of Demeter which were so successful last year will be repeated, Mrs. Jones says, and the same organization is also planning to hold the annual reception.

Friday, the Dane County Home Talent Tournament will be held. The winners of four district tournaments in the county will compete for the final prize, and an old time evening of fun is in store for the visitors.

Common Stain Removers

The Home Economics Extension Department of Purdue University advocates the following stain removers:

Grass—if colored material, use dark molasses—if white material use ammonia and water, being careful to wash all ammonia out before drying.

Blood—wash in cold water, then soap and warm water or paste of uncooked starch.

Ink—soak in sweet or sour milk several hours; if dry and set use Javelle water or ink eradicator. Javelle water is good for removing iron rust, mildew, fruit stains, etc., and is made from the following ingredients: 1 lb. washing soda; 1 qt. boiling water; ½ lb. of chloride of lime; 2 qts. cold water. Add the boiling water to soda. Dissolve the lime in cold water. Let the mixture settle and pour the clear liquid into the dissolved soda. Bottle and keep in dark place. In using Javelle water, place stained portion over a cup or bowl, and apply remover with medicine dropper, rinse with clear water.

Tea, Chocolate and Cocoa—soak in cold borax water, pour boiling water through it.

Mildew—lemon juice, salt, and sun. Or soak in sour milk over night and sun. Javelle water may also be used.

Fruit—if fresh, use boiling water poured from height; if set, apply salt and lemon juice and expose to sun, or Javelle water may be used.

Iron Rust—lemon juice, salt, and sun or Javelle water.

Milk and Cream—wash in cold water, then soap and warm water.

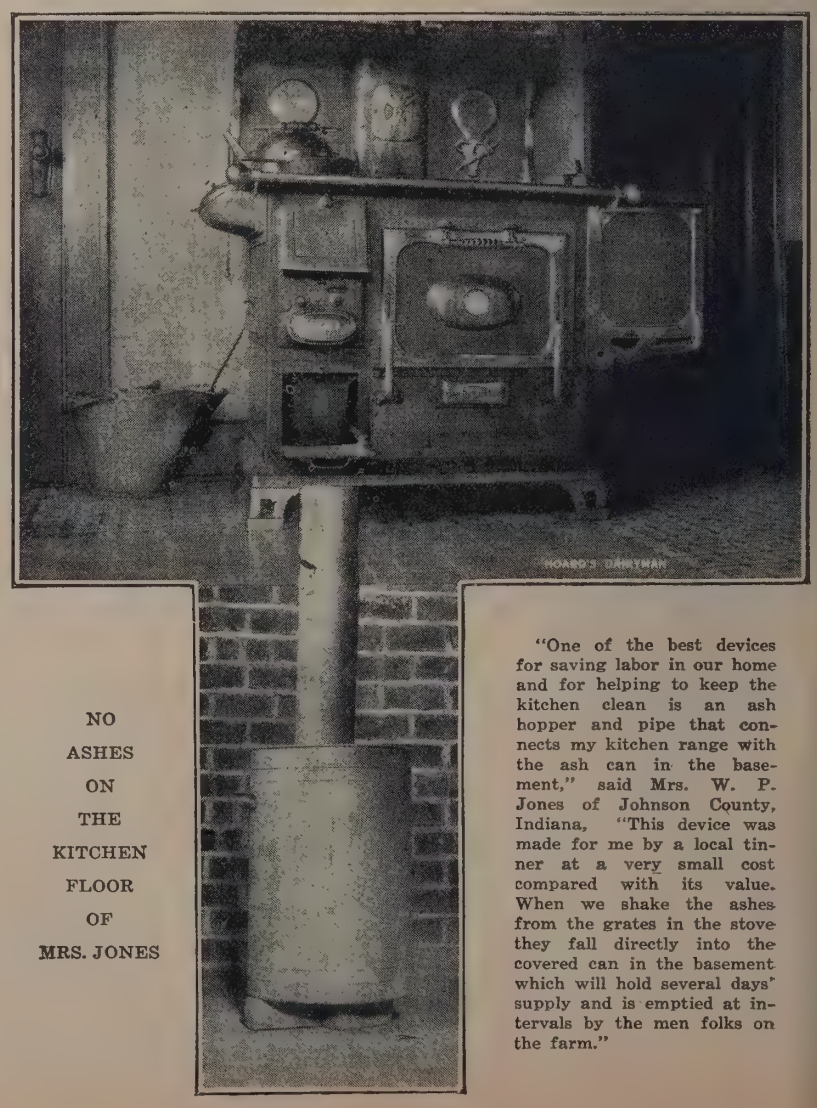
Axle Grease—apply lard or butter and wash in hot soap suds.

Style is not a matter of money. The woman who spends the most money on dress is not necessarily the best dressed. Very often her neighbor, with much less money to spend, will be more smartly clothed. It's largely a matter of taste.

In our Spring Fashion Magazine, we present a wide range of styles that are new, smart, and in good taste. For each one a pattern is offered and the designing is so clever that the styles are easily made.

In addition to afternoon and evening frocks, there are styles for wear around the house, also lingerie, children's clothes, embroidery, and some picture dressmaking lessons that are of interest to anyone who sews and of real help to the beginner.

Send 10 cents today for your copy of this book. Its style value is much greater than the price you pay and will be saved many times over on patterns. Address Fashion Dept., Hoard's Dairyman, Fort Atkinson, Wis.



Then and Now

Gertie: To think you used to catch me in your arms every night!

George: Yes, dear, and now to think I catch you in my pockets every morning!—Good Hardware.

Flipp: "What a surprise to see you in a full-dress suit! Did you rent it?"

Flapp: "No; but every time I stooped over I thought I would."

NO ASHES ON THE KITCHEN FLOOR OF MRS. JONES

"One of the best devices for saving labor in our home and for helping to keep the kitchen clean is an ash hopper and pipe that connects my kitchen range with the ash can in the basement," said Mrs. W. P. Jones of Johnson County, Indiana, "This device was made for me by a local tinner at a very small cost compared with its value. When we shake the ashes from the grates in the stove they fall directly into the covered can in the basement which will hold several days' supply and is emptied at intervals by the men folks on the farm."

Surplus Control Legislation

(Continued from page 65)

country a policy of governmental price control which, if it works to raise prices in the interest of producers, may at some future time operate to lower prices in the interest of the consumers? The Yearbook of the U. S. Department of Agriculture for 1923 estimated the average area from 1914—22 devoted to crops for direct and indirect export involved a total of 61,000,000 acres of crop land. The estimate is made also that if this area were devoted to production for our own use, we could maintain an increase of population of 21,000,000 persons. Our own population is increasing at the rate of 1,500,000 persons a year. Then in 14 years on the present basis of increase in population our cultivated land area held at its present acreage and without further artificial stimulation of production will be needed to supply our own people. When that time comes, and it will come before 14 years because we shall always continue to export commodities in the production of which we have a special advantage, such as cotton and hog products, what will happen if American agriculture has fastened upon itself a policy of government price control which may so easily be made to work to the disadvantage of the producer?

It is urged that government action to raise the price of farm products of which we have an exportable surplus would only be doing justice in making the tariff effective for agriculture. Our government from its very beginning has from time to time for one reason or another levied duties on certain articles. The avowed purpose has generally been to protect commodities produced within the country from the competition of similar commodities of foreign production. The idea that the government should take action to raise the domestic price above the world price by the amount of the duty is a new departure in tariff legislation. Common justice would demand that the government, if it is to embark upon this new policy, should not confine it to a few farm products but should extend it to all farm products. Agriculture is today so interdependent that the products which the farmers of one region sell in the market become the articles of purchase and the raw materials of the farmers of other regions. If the government is to take action to raise the price of bread and meat and grains which the dairyman, the poultry raisers, the potato growers, and general farmers of the East must buy, then action must also be taken to raise the prices of their products. If the tariff is to be made effective for agriculture, must it not in all fairness be made effective for manufactured products as well?

In view of all these considerations, I am confident time will reveal that the real friends of American agriculture are those who in this crisis resisted a price fixing policy on the part of the government.

[EDITOR'S NOTE:—The above is a resume of an address delivered by Congressman Brigham of Vermont before the annual meeting of the National Association of Commissioners and Secretaries of Agriculture. Congressman Brigham is a Vermont product—born and raised on a farm. He is a farmer by profession and owns and operates the farm which has been the property of the Brigham family since 1803. His great grandfather, Paul Brigham, owned and run this farm from 1803 to 1838; his grandfather, from 1838—1875; his father, from 1875—1913, and it came into possession of Congressman Brigham in 1913.]

Have Good Light
Indoors and Out

YOU'VE solved your lighting problem for all time—indoors and out—the day you get your Coleman Quick-Lite Lamp and Lantern. When you have these modern light-makers you are sure of plenty of *good* light for any purpose anytime, anywhere.

The Quick-Lite Lamp is brighter than 20 old-style oil lamps. Its soft, pure white brilliance is easy on the eyes—ideal for every family use—reading, sewing and for the children to study by. Fuel is motor gasoline. No wicks to trim; no chimneys to clean; no daily filling. U. S. Price $9.

The Quick-Lite Lantern is the handy, all-purpose light for outdoor chores, around barns, sheds, feed lots, granaries, garages, cellars, etc. Built on same principle as the lamp. Has mica chimney—rain-proof, wind-proof and insect-proof. Safe—can't spill fuel even if tipped over. Two popular models: L427, with built-in pump, U. S. Price $8.50; L327, with separate pump, one dollar less.

25,000 Dealers sell Coleman Lamps and Lanterns. If your dealer is not supplied, write us. Dept. HD11

Oat Hulls

Will you please tell me how I can feed the following feeds to the best advantage to dairy cows? I have timothy and clover hay mixed, good corn silage and cornstalks for roughage. I am now feeding a grain mixture composed of 50 per cent ground corn, 25 per cent ground oats, and 25 per cent oat hulls. In addition to this I feed about 2 lbs. of linseed meal daily to each cow. If it is necessary to add some other ground feed to obtain best results, what do you advise?

Burlington, Wis. H. W. K.

The silage and hay should be fed to the limit of appetite or all the cows will clean up. It is doubtful if much value can be had from the cornstalks, they being unpalatable and of low feeding value. In the winter time cows should not be turned into stalk fields because the cold wind will usually take more out of them than they gain from the stalks.

A grain mixture suitable for feeding with silage and mixed hay should contain from 16 to 17 per cent of digestible protein. The mixture now being fed contains 7 per cent of digestible protein if the linseed meal is not considered. A cow fed 8 lbs. of this mixture plus 2 lbs. of linseed meal would receive a mixture containing 11.6 per cent of digestible protein which is too low for the roughage fed.

The oat hulls have little feeding value. They contain only 3 per cent of protein but less of total nutrients than ground corn cobs. The fiber content is very high. The principal value attached to oat hulls is in using them to lighten heavy feeds such as ground corn.

A concentrates mixture suitable for feeding with silage and mixed hay could be made of 200 lbs. each of ground corn and oats, 100 lbs. each of bran and oat hulls, 250 lbs. of linseed meal, and 200 lbs. of gluten feed. This mixture contains 16 per cent of digestible protein. It should be fed at a rate of about 1 lb. for each 3½ to 4 lbs. of milk produced by Holsteins and 1 lb. for each 2¾ to 3¼ lbs. of milk produced by Jerseys or Guernseys.

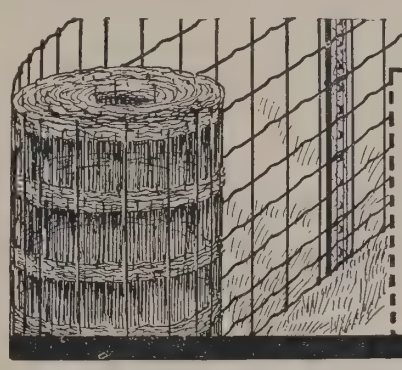
Jersey Cow Supersedes Daughter

Dairymen in Northern Wisconsin closely followed the unusual production test conducted in the herd of G. B. Reedal. An 11-year-old registered Jersey and her mature daughter were both on test and both promised to break the 305-day Jersey record for this state.

The daughter, King Milan's Daisy 2d, finished the 305-day test first with an official record of 625.43 lbs. fat and 13,585 lbs. milk. She made this record with calf and therefore won the American Jersey Cattle Club Gold Medal in addition to the state Jersey championship.

Her dam, King Milan's Daisy, finished test twelve days later with a record of 645.62 lbs. fat and 12,799 lbs. milk in 305 days. She thus supersedes her daughter as state champion. In a previous 365-day test she made a record of 729.92 lbs. fat and 13,499 lbs. milk.—American Jersey Cattle Club.

GET THIS NEW BOOKLET



Every farmer will want this new vest pocket book "Farm Records." Contains information about planting, grain weights, postage rates, radio log, fence erection, and pages for crop records, live stock records and farm accounts. Will be mailed free and postpaid together with our catalog of Super-Zinced Wire Fences. Use the coupon or a postal card.

Super Zinc-ed REG. TRADE MARK "Pittsburgh Perfect" and Hinge Joint Columbia Fences

will prove a money-making investment on your farm. With your fields fenced hog-tight you can rotate crops, grow more live stock, pasture fields as desired and practice modern, diversified farming. You will get the utmost service and satisfaction from Super-Zinced Fences with their full gauge and honestly spaced wires, the secure joints either electrically-welded or hinge-joint, and the Super-Zinced rust protection.

Super-Zinced Fences are made complete in our own mills from a special formula of steel, and armored against rust by the heaviest coating of zinc that can be successfully applied to wire. By our process the zinc is so closely bonded to the steel that it will not crack or peel. Super-Zinced Fences are guaranteed unexcelled in quality and durability, and include styles for every field, poultry, garden and lawn requirement. It will pay you to buy Super-Zinced Fences and make those long-delayed fence improvements this spring.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Autobiography of a Pioneer Dairyman

H. B. GURLER, Illinois

(Continued)

One of the most interesting of my recollections was of my acquaintance with W. D. Hoard. I cannot fix the date of my first meeting with him, but think it was at the first meeting of the Northwestern Dairy Convention at Mankato, Minnesota, which was forty or more years ago. As I remember, Hoard was president at that time, and continued to hold that office until the old Northwestern Dairy Association quit business, after the four states, Wisconsin, Minnesota, Iowa, and Illinois, had organized their state associations.

W. D. HOARD

I remember we held two conventions at Mankato and two at Algoma, Iowa, after which one was held at Beloit, Wisconsin. By this time the officers of the Northwestern thought we had done our work and we quit the field. I was treasurer when we disbanded, and had $250 in my hands which we divided between the Iowa, Wisconsin, Minnesota, and Illinois State Associations.

I visited Mr. Hoard at his home frequently, searching for information and inspiration as well, finding it a profitable place to go. I followed his experiments growing alfalfa on city lots in Fort Atkinson, going there frequently, and spent many hours digging into dairy subjects.

New ideas and methods were appearing fast in the dairy and creamery field at that date. The Babcock test and the centrifugal cream separator were revolutionary in their field, and a person in the business needed to be wide awake all the time or he was soon far down in the procession, which was neither profitable nor pleasant.

On one of my visits with Mr. Hoard, he told me he was looking for a young man to put in training for the Dairyman. Said he was getting old and that George Burchard was also quite an old man, and they would both be compelled to get out of the harness in a few years. Before the end of my visit, I told Mr. Hoard that I knew an outstanding young man whom I believed had the metal and a good start in training for such a man as he desired. I neither thought nor heard anything about it for about a year, when I heard A. J. Glover was with Hoard's Dairyman.

First Public Farm Talk

My first effort to talk about my farm experiments in public was made in 1881 at Professor Hall's fourth annual institute at Sugar Grove, Ill. Hall had heard of the hog and calf feeding experiments that I had been conducting for several years to learn the feeding value of skimmilk, and he went after me in the same manner that Professor Henry did ten years later to get me into dairy school work.

Hall used some of my pig feeding experiments as problems in an arithmetic he published about that time. This was a short time in advance of Professor Henry's experiments published in the old National Live Stock Journal. I did not agree with those experiments and this led to our acquaintance.

Hall was one of the best all around men I ever knew. My contact with him caused me to grow as it would any man who had anything in him. It caused his son Clyde to grow as a farmer until he won a gold medal as Master Farmer from the Prairie Farmer. Mr. Hall sacrificed himself in his work as superintendent of Farmers' Institutes in Illinois. I visited him frequently in his last illness, and it was painful to see him slipping away.

Chapter IV

Civil War Days

MY DEAR JUNIORS:—When writing my life story for you and I reached the time I enlisted for the Civil War, I felt that you would expect me to say something about my experience in it so I wrote something over 1,000 words. But it read just like the story of thousands of other soldiers. This caused me to throw what I had written into the waste basket and write your editor that he could not plan on anything about the Civil War. After a little thought this did not look good to me as you boys might think I was ashamed of my part in the Civil War. It occurred to me to write some little incident showing that I was there at least, so here goes.

My regiment was located one summer at the junction of the Tennessee and Ohio rivers. This was important ground as it was the line between the North and South. We were given the duty of guarding three miles of this line. Our lines extended from the Tennessee river to the Ohio river three miles below its junction with the Tennessee. The Tennessee ran through Rebel territory and was alive with an alert and resourceful enemy.

At the junction of the Ohio and Tennessee rivers there was a ravine some 100 feet wide and about 40 feet deep, and there were quite large trees growing in the bottom. Our most important and dangerous picket post was on the bank of this ravine. Quite frequently our pickets would be shot at from the opposite bank.

We tried many times to capture the enemy by sending men to get behind them. This was very difficult as these attacks were always on extremely dark nights. The Rebels could see very little unless we had a fire, but they knew the exact position of our post, and they succeeded in killing a man occasionally.

This condition existed when my regiment was sent there. After several months of this annoyance the colonel ordered the first lieutenant and myself to take 25 men and try to solve this problem. When it was so dark that we could just see to locate the men, we placed them along the ravine. We all laid on the ground and listened. We had to be guided by feeling and hearing as we could not see one foot from our faces after we had been in our location a half hour.

The men all had their instructions, and each man had to act on his judgment as no commands could be given without the enemy being warned. We laid for about two hours when a single gun exploded, followed by a terrible yell, then silence. The lieutenant and I were about 100 feet or less from the place where the incident was taking place. After feeling our way to one of our men, we laid with our ears to the ground and listened.

Soon a tree fell in the ravine. This was hard to account for as there was not a breath of air moving. We could do nothing until daylight. Then we went to the place in the ravine where we heard the tree fall and found that this was half a tree that had grown in two parts, one part of which split off and fell.

We discovered by close examination that the bark on this fallen part was torn, showing that someone had been climbing it. There were some large limbs just at the level of the ravine bank and we reasoned that the enemy had located themselves on these limbs and when they shot at us it looked as if they were shooting from the opposite bank. They probably felt, after the shot and yell, that the tree was safer than the ground.

MR. GURLER DRESSES UP IN HIS 62-YEAR-OLD CIVIL WAR UNIFORM

Our report to the Colonel was "One shot, one yell, and one tree felled." We had no more trouble at that post.

Chapter V

Hunting Experiences

MY DEAR JUNIORS:—I have two bear stories that I have not told you about. In one of these stories the bear beat me as I could neither shoot him nor get him in a trap. I will tell you now of one that did *not* get away from me.

I spent my time mostly hunting deer on this trip and was staying with a woodsman at a lumber camp seven miles from the farm. This lumberman was watching a dam to let the water go down the river as it was needed to take a drive of cedar logs down to the mill at the river mouth. One day when he came up he told me that he stopped at a cabin on his way up and was in the kitchen looking at pictures that the cook had pasted on the log walls the previous winter when he heard a noise under the window. Looking out he saw a bear feeding from the slop hole.

He also told me he was to open the gate wide two dates as the drive was then below the next dam, and that he would follow on a raft, taking the flood water to help him over some rocks and rapids. I told him I wished to go with him to the camp where he saw the bear and that I would go up to the farm eight miles the next day and see if an expected friend had come up to hunt with me. I started up the next morning, but when half way to the farm met the friend.

The next day we took the raft, after the woodsman had let the water flow for a couple of hours, as he told us that the raft being made of dry cedar logs would run faster than the flood water and there would be danger of our getting on rocks in shallow places. We had run several miles when I heard the roaring of water and asked our man what it meant but got no reply. We soon reached a point where we could see the water going over a drop.

There was no way of dodging the matter so we dove over the drop of four feet. Luckily the water was no deep below the fall so no damage was done outside of wet blankets, guns and food. Soon after this we reached the camp and unloaded. The woodsman went on to the next dam where the men working the drive were located. We dried out our clothes and food that night but made no move to get the bear.

The next day we planned how we would try to get him. As the slop hole was directly under the kitchen window, I took two panes of glass from the window and placed them in the sash inside the kitchen so we could move them when we got a chance to shoot. When night came my friend took the first watch. He was to call me and we would both shoot at a signal from him. He had a rifle and I had a double barrel shot gun loaded with heavy buck shot.

I laid down on the floor of the

(Continued on page 96)

England Wins Contest

For the first time in some years the junior cattle judges representing England defeated the junior judging team from the United States at the annual international cattle judging competition held this past summer in England. The winning team thereby came into possession of the Daily Mail Gold Cup.

The score of the English team was 828 points as against 811 points made

ENGLAND DAIRY JUDGES WIN

Left to right: Edward Wise, 18 years old; R. G. Noakes, club leader; Edith Harriott, 16 years old, and John Harper, 17 years of age.

by the Maryland judges. Edith Harriott with a score of 283 and Edward Wise with a score of 280, both of England, were first and second respectively in the individual judging. Ralph Walker, Maryland, was third, followed by Arthur Dunnigan, his teammate, with John Harper of England, fifth, and Stanley Sutton, the third member of Maryland, last.

Judges for the contest were H. H. Kildee of Iowa and Allan Skelton of England. The umpire was E. A. Weir of Canada. The judges agreed unanimously on the winning team.

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

Three series of interesting and instructive articles begin in the January 10th issue. They are: Trailing Holsteins to South America, Which Breed is the Best?, and What I Am Trying to Do on My Farm.

What has John Zoberlin accomplished? Coming to this country from Bavaria 29 years ago without a dollar in his pocket, he worked the first year for $120. Hard work and thrift have earned him a beautiful 200-acre Wisconsin farm and a fine herd of dairy cattle. In his herd he has had six 1,000-lb. cows, seven 20-lb. cows, two junior three-year-olds that made world's records last year, and he has raised General Homestead Mercedes, an outstanding bull of the Holstein breed.

How is one to decide on the best breed? These several considerations are important to the man who would discover which is the best cow for his farm: "Which one do you like?" "What is your market?" "Market price of the breeds," and "What do the neighbors own?" The last is by far the most important.

How does W. J. Dougan maintain soil fertility on his farm? Says this southern Wisconsin dairyman, "Every field on my farm is analyzed. Most of my fields need lime from two to four tons per acre, and they get it. The other element that must be supplied from without is phosphorus. I have bought some rock phosphate, but find that an abundance of manure from a herd fed on a ration containing bran and oil meal is putting back into the soil the elements sold off in milk. I am supplying the soils on my farm with humus by growing legumes, clover and alfalfa. Therefore, my soils are cheaply and abundantly supplied with nitrogen.

Why does he practice crop rotation? To avoid impoverishing a field for a single crop, and to avoid putting the soil elements out of balance. His clover rotation consists of corn one or two years, small grains seeded to clover one year, clover hay or pasture one or two years, and then manured and back to corn.

How does the government grade hay? Alfalfa hay, for instance, is graded on the three factors: color, leaves, and foreign material. U. S. No. 1 alfalfa must have 50 per cent or more color, 10 per cent leaves, and not more than 5 per cent foreign material such as leaves and old rakings. (See "Are You Buying Hay?")

Does the government inspect hay? Yes, at the present time there are two licensed inspectors available for shipping points in Nebraska. Both of these men are located in Dorsen County.

Junior Letters

A Hoard's Dairyman Fan

Hoard's Dairyman Juniors:—Here's another Junior, it's a girl, though! I don't suppose the boys will like that.

I've always been planning to be a Hoard's Dairyman Junior, but it always seemed that there was something else. But finally, here I am!

I'm just a country girl, almost 15 years of age, brown eyes, brown hair, five feet, three inches tall, weigh about 110. My birthday is the 10th day of March. Maybe I have a twin sister. Please write to me if I have.

We live on a 280-acre farm. We milk 34 cows, have 4 horses, 2 colts, about 40 pigs, 100 chickens, a couple of cats, a dog and a little puppy.

I have a brother a year and a half older than I, and one three years younger than I.

My father bought this farm seven years ago. He used to be a Swiss cheesemaker near Madison, Wis., close to a little town named Mount Horeb.

He has taken Hoard's Dairyman ever since he bought this place. We all like it because there are articles in it for every member in the family.

I always read the junior page. There are often very interesting articles on that page.

My father and mother like it because sometimes there are things in it from Switzerland, their home country. They have lived in the United States for 18 years.

We have about 70 or 80 head of cattle on this farm all the time, including the calves.

All those wishing to write to me, address to R. 6, Eau Claire, Wis.

Helen Wittwer.

Subscribes to Hoard's Dairyman

Hoard's Dairyman Juniors:—I have been reading our page every time Hoard's Dairyman comes. The reason I haven't written before is that I have been helping with the farm work and now have started going to high school. I do not have very much time for writing letters during the week, so have to wait for Saturdays to come.

Thursday, Oct. 7th, the 4-H club workers had a fair in Waterville. As I am in the garden project, I brought some nice big carrots. I won first prize or a blue ribbon. My garden didn't turn out as well as I expected.

I am subscribing for the Hoard's Dairyman instead of my dad. He will read it just the same. He says, "there are many interesting articles in it." I agree with him.

My address is Waterville, New York.

Muriel Northrop.

Virginia Future Farmers

Hoard's Dairyman Juniors:—You will notice on my enclosed application as a member of Hoard's Dairyman Juniors that I said I belong to the future farmers of Virginia, (F. F. V.'s.) This is a new organization of all the boys taking vocational agriculture in the high schools.

There has been a considerable amount of work done on this organization in the last year and it is a very good organization. I am president of the Chapter of Broadway High School and will try and answer any questions that you wish to ask me in regard to it.

I enjoy reading Hoard's Dairyman very much and my only regret is that it doesn't come oftener. We have arranged to have the magazine comes to our agricultural class and we get very much information on dairying through it. My address is Broadway, Virginia. Carl G. Showalter.

On the Care of Calves

Hoard's Dairyman Juniors:—I am glad I can be one of the club's members. I have been given a calf to be mine as long as I take care of it. I will tell you how I feed it.

Uncle told me that a young calf should be by itself and not jostled around, so he made me a pen with lots of light, and where it is dry. I keep my calf there by itself for two weeks or even three, then we have a large pen where the larger calves are kept, and we turn my calf out there when it is able to stand the cold better; and it can get more sunlight but be sure the calves are kept dry so they don't take cold.

I feed my calf first, whole oats and skimmilk and a little alfalfa hay and clear, cool water, and salt each day.

When she is three months old which is soon, I will feed her ground oats and corn, clover and alfalfa hay.

I wish some of the juniors would write to me. My address is care of Verner Sorenson, Mount Tabor, Wis.

Christine Jensen.

A Sand Table in School

Hoard's Dairyman Juniors:—We have been working in our sand table at school. First we made a map of South America and put all the products on it. Now we have a farm built on it. We put corn shocks on it too.

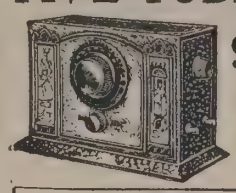
We have started to walk to school. We walk 1½ miles each day.

My sister is writing for Glen this time. We have our school room all cleaned up. We put up new pictures and white window curtains.

Well I must close, wishing good luck to the Juniors. Ina Smith.

My address is Goldendale, Washington.

Wins in Club Work



Hoard's Dairyman Juniors:—I'm real glad to join the Junior Club, and I also belong to clubs in my home town. I will have a great time reading the Hoard's Dairyman.

I want to thank the Hoard's Dairyman for giving me a year's subscription to their paper. I was planning on subscribing for it when I was surprised to get the first copy. Next year I am going to subscribe for it and tell other people about the paper.

I have a little to say to my new Junior Club friends, and I say that a trip to the state fair is a great adventure. I had a great time at the fair and had a big surprise when I was presented a silver cup for champion showman of South Dakota.

S. Dakota. Arden Witham.

Write for catalog and price list. PETERS POULTRY FARM, Box 572, Newton, Iowa. 26-*

FARMS FOR SALE

Dairy Farms Big Opportunity: South Florida where fast growing population makes high priced markets—richest muck and prairie land grows all year forage, as well as fruit and truck crops. Good water, good transportation, two cross state highways, paved, borders property. Two mainline railroads nearby, adjacent to the fast developing, beautiful Ridge Section. One of the best dairy developments in the state adjoins this. Both east and west coast cities market available. Prices of milk very high. Cost of feed low. Large holdings to choose from. For further information write M. W. WOOLSEY, 430 South Michigan Avenue, Auditorium Hotel, Chicago. 2-3

Dairying in the Ozark Region of Southern Missouri and Northern Arkansas means 9 or 10 months open grazing—pure mountain spring water—wonderful grass—mild and healthful climate. Proximity of the great markets of St. Louis, Kansas City and Memphis makes quick delivery and good prices. Prosperous growing communities, good schools and fine hard surfaced roads. Land can be bought or farms rented at prices that insure good profits. Write for full information about this land of great opportunity. FRISCO RAILWAY, 883 Frisco Bldg., St. Louis, Mo. 23-spl.

Come "Where Sunshine Spends the Winter," and buy 100 splendid registered Holstein dairy cows, together with as much irrigated alfalfa land as you may desire. We cut alfalfa 6 times a year. We have no crop failures; no blizzards—sunshine every day and cows sleep out in the open. Fine market for everything we produce. Splendid residences, beautiful location, fine neighborhood. Full information upon request. GILLETT'S DAIRY, El Paso, Texas.

For Sale or Rent—Du Page County farm, 491 acres. Improved highway, close to Chicago, unusual dairying facilities. Close to two schools, one-half mile several railroads. Three houses, all improvements. Possession March. Address 2905 HUBBARD, Hannibal, Mo.

For Sale—180 modern Northern Illinois dairy farm, or will rent same if party buys one-half interest in personal property and machinery. A good income from retailing milk in live city. Please do not answer if you have no money. Address BOX 269, care Hoard's Dairyman.

For Sale—540 acre well improved dairy farm one mile from Hettinger, the county seat—a good, live town. Good new buildings, house wired for electricity, excellent water. For terms and particulars address owner, J. A. BALSIGER, Hettinger, N. Dakota. 2-3

80 Acre Farm for sale or rent in Waukesha County, Wis. Electric lights in house and barn. Some machinery, feed, and three horses. M. L. COYLE, 781 Cass St., Milwaukee, Wis.

For Sale or Rent—Highly improved dairy farm, 155 acres, located on the edge of city limits Fergus Falls, Minn. Possession Mar. 1, 1927. ULLAND LAND CO., Fergus Falls, Minn. 2-3

54½ acre farm; brick house, basement barn, machinery shed, silo, 6 acres of nice timber woods, good soil, opposite public school and ¼ mile from Catholic church and school; 7 miles from Milwaukee near Highway 15; terms reasonable. Address JOHN WICK, R. 2, Box 145, Menomonee Falls, Wis.

Wonderful opportunities for economical dairying and chicken raising. Write CHAMBER OF COMMERCE, Quitman, Georgia.

Farms for Sale in Clark Fork Valley, O. S. McCLURG, Clark Fork, Idaho.

Further particulars gladly furnished

MELIN-PETERSEN Co., Sale Mgrs., 306 Gorham Bldg., MINNEAPOLIS, MINN.

Minnesota Pure-bred Sire Campaign

Through the co-operation of the various live stock breeders' associations in the state of Minnesota, and particularly through the efforts of the members of the Minnesota Live Stock Breeders' Association, the Minnesota Pure-bred Sire Compaign has been taken over by the Minnesota Live Stock Breeders' Association and will be carried on in the same manner as the bull campaign but will be wider in its scope.

Axel Hansen, nationally known Holstein judge, has been employed by the Minnesota Live Stock Breeders' Association to act as state manager of the pure-bred sire campaign and in making this selection the association has secured a man whose training in live stock development is very sound.

The pure-bred sire campaign as conducted by the Minnesota Holstein Breeders' Association was very successful when it is considered that the management was busy with many other projects relative to the state Holstein Association. During the time the work was carried on, over a period of three years, seventeen counties were covered and a total of 1,215 pure-bred sires of all breeds were placed, making an average of 71 per county. —The Minnesota Holstein Breeders' Association.

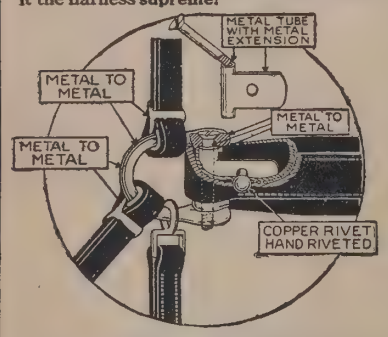
BUILDERS OF HEAVY DUTY MOTORS FOR TWENTY YEARS

Don't Pay for 4 Months



We will send you an Olde Tan Metal-to-Metal Harness—and you need not pay us a cent for 4 months. You have a 30 days' Free Trial—without the slightest obligation to buy unless satisfied. Use this harness as if it were your own and put it to every test. If not satisfied, send it back at our expense. If satisfied, pay us nothing until four months after you receive the harness.

Olde Tan Metal-to-Metal Breeching Harness With Back Pads
Nine Other Models

Olde Tan Harness

Write at once for the remarkable story of this famous Olde Tan Harness. Olde Tan is made extra heavy, of only the strongest hides, perfectly tanned, and has the "Buckleless Buckle," which is far stronger than the ordinary buckle, and **cannot** slip. These features **alone** give Olde Tan marvelous strength and durability—but, **in addition,** many more years have been added to its life by Metal-to-Metal construction at every point of greatest strain and friction—making it the harness **supreme!**

One of the *many* places at which **Metal-to-Metal** reinforces Olde Tan

"Not a Cent for Repairs!"
So writes Lewis Hunt, Prescott, Kas., after 3½ years' use, and he adds, "If I had to buy 100 more sets they would all be Olde Tan." "4 years and no repairs" writes W. H. Grady, Wall, So. Dak. "A runaway, with a corn binder, cut off three fence posts and four telephone poles—and we have proof nothing ripped or tore on the harness." —C. W. Schubbe, Elgin, Ill. **If you want a harness you can depend on—get Olde Tan!**

Mail Coupon for Free Catalog!

Do it now! A poor harness is dear at **any** price! If your harness breaks down during spring work, the delay may cost you many times the price of Olde Tan. So don't wait! Get it NOW! **Remember—30 days' free trial, $7.50 per month. Or nothing to pay for 4 months, if you prefer. But you must act quick! Write for free book TODAY!**

Use of Barn Sheets

HOARD'S DAIRYMAN:—The average production of the South Newaygo Association of Michigan is gradually increasing, although cows are freshening much later than usual. Despite the adverse weather conditions this fall the production was slightly greater than last year until this month when the average was four pounds fat below December of last year, due to the smaller number of fresh cows.

In regard to the keeping of barn sheets, I would like to say that the idea of carrying them for three or four months is very good. A tester then has them for comparison. But it seems to me that a tester has a great plenty to carry with him without any unnecessary luggage. Why not leave the barn sheets each month in the member's herd book? They are always handy for the owner in looking over and comparing one month with another and the tester has access to them each month. When a cow has freshened soon after my previous visit, then her record is figured for a full month and the extra day's credit written in above the month's record. The two are added together when put in the herd book, mostly as a matter of neatness, but the barn sheet not only shows the complete record but also the record for the 30 or 31 days in that testing period. Thus the barn sheet may show things in a more detailed form than the herd book and may help the owner in looking over the month's work.

Furthermore, detailed feed help should be on the back of each and every barn sheet, showing the ration suggested to feed together with the amount of grain each cow should have. CLARENCE PRENTICE, Tester.

Michigan.

Alfalfa as the Only Feed

HOARD'S DAIRYMAN:—Figures of the second annual report of the Lake County, Montana, C. T. A. indicate that good alfalfa hay and well kept irrigated pastures which were the feeds used mostly by the members were also the most profitable feeds.

Of the nine herds qualifying for the National Honor Roll, four were fed from $6.81 to $23.31 worth of grain in addition to alfalfa, with returns above the cost of feed of from $91.41 to $98.57 per animal. Of the remaining five herds, three were fed $.25 to $3.75 worth of grain and two herds had only alfalfa hay and irrigated pasture. Their returns above feed cost ranged from $104.19 to $136.17 per cow. The high herd in the association was one of the two herds last mentioned, making 386 lbs. fat each on alfalfa hay and irrigated pasture alone.

Grouping the cows according to the returns above their cost of feed finds that of 27 cows with an income above feed cost of over $125 each, nine were fed considerable grain, eight were fed less than 200 lbs. each, and ten received no grain.

Of 31 cows with an income of from $100 to $125 each above feed cost, 12 were fed more grain, 10 less than 200 lbs. each, and 9 were fed no grain.

Of 69 cows with an income of from $75 to $100 each above feed cost, 24 were fed more grain, 16 less than 200 lbs. each, and 29 were fed no grain.

Alfalfa hay was sold at around $8 per ton in the stack but figured here at $10 per ton and the pasture around $2 per cow per acre monthly. The usual grain mixture was barley, oats, and bran, figured at a cost of from $30 to $35 per ton.

Montana. C. A. ARNET, Tester.

An Iowa Report

HOARD'S DAIRYMAN:—The fact that more members of the Tama Association of Iowa are becoming interested in dairy husbandry work is: Twenty-three take a dairy paper, ten own milking machines, twenty-four own silos, and twenty-two have purebred sires. Members have increased their legume acreage to 277 acres of sweet clover, 91 acres of soy beans, and 85 acres of alfalfa. The result of this increase is that four will not need to buy a protein-rich concentrate as they will have enough home grown feeds to balance their dairy rations. Twelve of those who have to buy will save $125 by buying co-operatively 20 tons of oil meal and 10 tons of alfalfa hay that have been ordered and received.

Three cream separators tested twice more than .05% while six tested but once more than .05%. One separator on a board floor lost its owner 13.2 lbs. fat valued at $6.33, loss due to vibration. If the separator had not been changed to a concrete floor the loss would have been $72 for the year.

The member showing the most interest in milking and feeding regularly was the one who had the high herd of 29 cows that averaged 366 lbs. fat. He also had the high cow, with 535 lbs. fat.

Iowa. WILEY WHITEHEAD, Tester.

Does Continued Testing Pay

HOARD'S DAIRYMAN:—Macomb No. 2 C. T. A. of Michigan was organized in May, 1923. It is now in its fourth year and a partial answer to the question, "Does continued testing pay?" is found in the fact that in 1924 twelve members continued testing, in 1925 there were 25 members who continued, and in 1926 there were 22, and there is a waiting list.

A practical example of three years' progress is shown in a herd that in 1923 were just grade cows whose ancestry was not definitely known, and were fed by guess, and that's 'good enough." During the three years following, two good sires were used. The first year the herd averaged 262 lbs. fat, the next year 280 lbs., and the third year 349 lbs.

The increased production in the second year was due to better feeding, installation of drinking cups, and interior of barn remodeled for more comfort. The third year increased production was due to influence of breeding and management, only one of the original cows remaining in the herd. The herd now consists of eleven head, nine of which are under five years old and all daughters of the original cows.

Did improvement stop here? Well, let's see. In the beginning no farmers' bulletins were read and discussed. Today this farm house is a *home,* with modern conveniences such as bath room, septic tank, pressure water system, kitchen and pantry remodeled, radio, and improved farm management.

Here is what happened to another herd in 1925: For sale, Ute, a raw boned, homely two-year-old, just fresh. Although priced at $90 there were no buyers. Along came the tester two weeks later, saying: "Where did you get that thing?" John replies, "I have a notion to beef her. She gives lots of milk but it looks blue. I admit she is a homely looking rack of bones." Findings of the first test showed 59 pounds of milk daily and 52 pounds of fat for February. The first 8½ months she made 11,978 lbs. milk and 379 lbs. fat. Ute doesn't look quite so homely now and is not for sale.

Our county fair was held in September. "Best cattle exhibit in years," was the comment of the old timers. How come these good cattle exhibits? Due to the co-operation of the members of the four cow testing associations in the county of Macomb.

Above are a few incidents of progress accomplished by co-operation. Every tester takes pride and pleasure in working with progressive members. Both members and tester gain knowledge, ambition for the best, and success by "continued testing."

Michigan. CASPER BLUMER, Tester.

Sanitation

We have heard frequently and with much volume lately the word "sanitation" in connection with the prevention and control of diseases and parasites of swine. What is sanitation with respect to its beneficial influence? It is timely that we understand fully the positive side of this practice and thereby not be disappointed by a faulty use of something that we think is sanitation.

L. Van Es of the Department of Animal Pathology and Hygiene of the University of Nebraska has said some things about false notions of sanitation that we think are more than worth the reading.

He says: "The word 'sanitation' often is a mere commonplace uttered when the problem in hand is especially baffling, while often something alleged to be sanitation is undertaken merely because it yields a certain degree of comfort of the conscience when something is done or said with the best of intentions.

"Sometimes disinfectants are promiscuously scattered about the premises and this is called sanitation when in reality nothing more is accomplished than the creation of a smell. In other cases stable yards and pens are divested of their rubbish and this completes the process of sanitation as if the disease would disappear at a mere gesture.

"With the prevalence of such ideas it is not surprising that the results are often far from those hoped for, that sanitation so frequently inspires but little confidence and that farmers are so commonly induced to pin their faith in the useless nostrums, biologic or otherwise, which are constantly dangled before them by the clever salesmen of our day.

"Sanitation thus is often given a rather vague and indefinite position among the measures of disease control. This is further enhanced by the fact that the most costly of all swine diseases, hog cholera, is probably one which is least amenable to purely sanitary methods.

"Yet there is no fallacy more potential of costly mischief and of far-reaching bad results than the belief that sanitation is only of a subsidiary importance among the various factors of our disease fighting machinery. In fact, in the case of a certain group of highly important swine diseases, real sanitation is as yet our only hope in coping with rather disastrous situations."

The words of this investigator imply that there is much false understanding in employing the weapon of sanitation in health defense in pig yards.

Cholera is generally rated as the disease of greatest importance both from an economic and mortality standpoint. It is quite likely, however, that if a careful survey were made of pigs from birth to market weight it would be found that parasites, necrotic infections, and pneumonia-like diseases take a far greater economic toll than is commonly calculated even though the mortality of these is very much lower than with the hog cholera. Of these three groups of pig troubles, parasites and necrotic infections are best controlled by real sanitation. False sanitation will do little good.

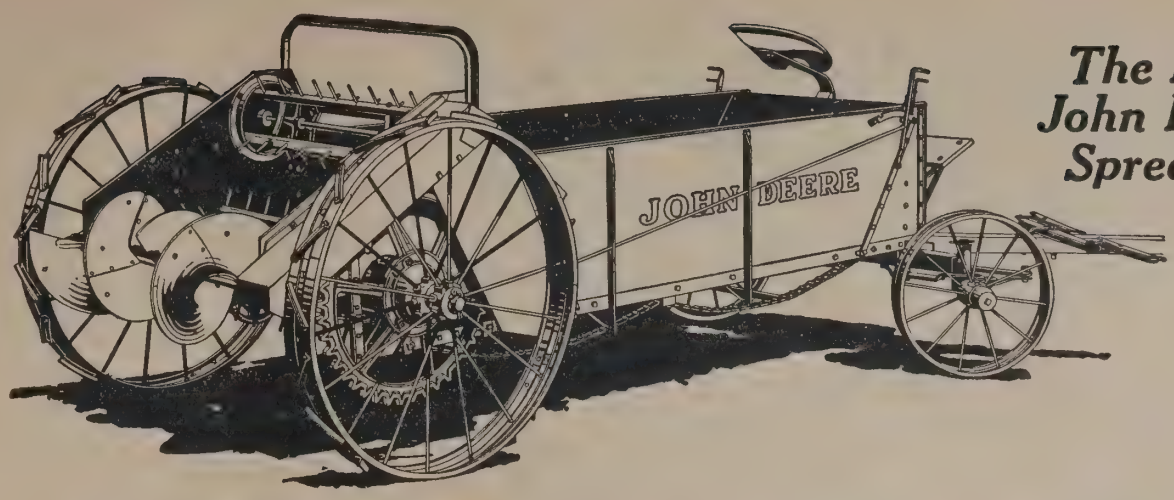
By sanitation is meant the creation and maintenance of an environment which is safe to animal life. Since the soil in the constantly and frequently over-populated hog yards is the repository of most of the body excrement of swine, it is important that any measures of prevention and control consider purification of this soil.

Obviously the contaminated soil of the hog yards cannot be disinfected in the sense that we ordinarily understand this practice. It follows, therefore, that other means must be employed of ridding the soil of disease germs and parasite eggs. Nature with the aid of cultivation and time will purify the soil. In the meantime it is necessary to provide other clean yard and pasture quarters for the young, susceptible pigs.

In other words, two things are absolutely essential in providing safe quarters for swine. The first of these is that the contamination in the old yards must be cleaned up if one expects to grow clean hogs in these yards; the second is that temporary, clean quarters must be provided while the old yards are being purified. No half-way measures will succeed.

Comparing Feeds

Frequently swine producers are concerned about the comparative feeding value of different grains for feeding pigs. When fed in feeding trials in such a way as to make a fair comparison and using corn as a basis, it has been found that 100 lbs. of corn are equal to 110—120 lbs. of ground barley, to 120—125 lbs. of ground oats, to 102 lbs. of ground rye, to 90 lbs. of ground wheat, to 105 lbs. of hominy meal, and to 110—120 lbs. of ground grain sorghum. With these figures and the prices of the different feeds one can determine which is cheapest to feed.



Hog Prices

Averaged for a period of years the gain in price per hundred pounds of hogs marketed in September as compared with the price in December or January is found to be about 15 per cent; the gain for hogs marketed in October about 9 per cent over the December or January prices.

Over a series of years September is the month of highest hog prices and January the lowest with December very close to January prices.

Pigs marketed early get the advantage of higher prices but lose out on the advantages of hogging down corn or frequently on the lower price of new corn. Pigs full fed for early market do not make as full use of forage crops as pigs fed limited grain on forage.

Hogs make money only while they are in good health. A sick pig gains little if any and more frequently loses weight. Safeguarding the health of pigs is just as essential as feeding them. What does it profit to feed a sick pig?

The New John Deere Spreader

This New Spreader Gives You the Four Features You Want

This new, narrow, tight-bottom John Deere Spreader **with the beater on the axle and the box-roll turn** gives you a spreader that **is easier on you, easier on your horses, does better work** and **lasts longer.** It combines in one machine the four essentials that are really important to you in a manure spreader.

Its low, easy-loading box saves you from 15 to 25 per cent of the work in loading. The energy required to load 100 loads of manure onto the ordinary spreader will load from 115 to 125 loads onto the New John Deere. This is a tremendous advantage in itself.

Then consider the saving of your horses. Hundreds of present owners of the New John Deere who have always used three and four horses on the ordinary spreader are using only two on this machine. Its higher drive wheels, fewer moving parts and roller bearings give you lighter draft in a spreader than you have ever known before.

Another important point; notice that the beaters are low to the ground; manure is not thrown high in the air, therefore, winds do not cause drifting and uneven, unsatisfactory spreading. The New John Deere spreads a wide, even blanket of manure beyond the drive wheels—its better work you will surely appreciate.

This new spreader is built to the high standard of quality that has made John Deere implements famous for longer life and lower upkeep costs. It will prove a money-maker for years to come.

Remember, that two exclusive features, the beater on the axle and the ingenious box-roll turn, make possible this combination of outstanding qualities.

Right near you, at your John Deere dealer's, this new spreader is on display. See it. If you compare it carefully with others you are sure to want its exclusive features.

The New John Deere Spreader is a fitting team mate for the famous John Deere Spreader, the spreader with the beater on the axle. In a tight-bottom spreader you can now get the exclusive features heretofore found only in the John Deere.

Be Sure to Write for These Free Booklets

"Soil Fertilizers," in a new and better form, is a comprehensive treatise on the value and use of farm manure and other fertilizers—worth money to you. The other booklet fully illustrates and describes the New John Deere Spreader. Both free. Address John Deere, Moline, Illinois and ask for booklets S-414.

Poultry on the Dairy Farm

Turkey Raising

The average farm turkey raiser is meeting greater competition each year in attempting to rear a respectable percentage of those hatched. Part of this is due to the greater prevalence of blackhead and part to the fact that chickens and turkeys do not seem to range together satisfactorily.

Some very interesting experiences are encountered each year among parties that are making a success of turkeys in the state. One of the pioneers in the day-old turkey industry is H. V. Gregory of Wisconsin. He started shipping day-old poults some years ago and has now established a business that has developed beyond his supply. The poults are shipped in the same manner as day-old chicks over the same distance and with practically no loss.

In addition to this phase of the business which Mr. Gregory has sponsored, he has also developed a flock of exceptionally large, well colored Bronze. Most of his outlet is through the sale of breeding stock but a reasonable percentage of the inferior individuals is sold for market purposes.

Chickens are used for brooding purposes. During the hatching season there is a standing order for broody hens. With this method and the range which his farm offers, the mortality has been exceptionally small.

The southern end of Douglas County, in the Solon Springs section, is a big farm flock turkey area. Some of the exceptionally fine turkeys used for the boat trade are developed by Mrs. Frank Waterbury. On this farm they have had the Hollands, Bourbons, and Slate but now raise Bronze. Mrs. Waterbury is partial to the Bourbon, however, because of the shape of the dressed carcass and the chance to avoid black pigmentation resulting from the colored feathers.

Last year she had ten hens mated to a yearling tom. The average production per hen is about twenty eggs in the first clutch and sixteen or eighteen in the second. One of the hens was still laying early in November.

The turkey range is a large fence tract of cut-over land. A frame building boarded on three sides and covered with wire on the front is the only house utilized. It is single boarded; the floor is covered with clean sand; roosting poles are supplied and all stock is quartered in this structure. An attempt was made to house the turkeys with the chickens one winter but was so unsatisfactory it was never repeated.

Nesting boxes are distributed around the enclosure. Watch must be maintained constantly to detect other nests which the hens may establish. Regular gathering prevents chilling of the eggs.

Some of the turkey hens are allowed to set on the first clutch of eggs and the rest are set under chickens. When the poults are hatched all are given to turkey hens. Each brood is carefully watched and brought into their house each night and not allowed out in the morning until the grass is dry.

First feeding is a combination of chick scratch feed and a mash that is low in corn combined with bran and middlings. Enough red pepper is added to give a decided color to the mash for the first few weeks. When possible this is moistened with milk.

About 160 poults were hatched this season and 140 were on hand this

A FEW GOOD DINNERS

A CHEAP, SATISFACTORY TURKEY HOUSE

fall. This is a small loss and discounts some of the statements made about heavy losses. This is a clean range kept only for the turkeys.

A short feeding period of two weeks on a heavy corn ration is followed just before marketing. This allows sufficient time for finishing and yet avoids a heavy loss.

In direct contrast to this method we find another in practice on the commercial turkey farms. There are three of these in the state—Spooner, Holcomb, and Stanley.

The Badger Turkey Farm incubates and broods all the poults artificially. The hens to be mated with a tom are carried in a lot together. The eggs are collected regularly and incubated in a machine. When the young turks hatch they are placed in a colony house with a coal burning brooder.

The Axtel method is followed in that the house is placed on a clean, fresh alfalfa range with four yards. The lot is turned into each yard in succession as the forage becomes short and poor in the one preceding. A prerequisite for blackhead elimination is thus insured.

A second step is made by properly controlling the ration. It is apparently not so important what the combination of feeds may be as long as the method of feeding is correct. Overfeeding does more damage than probably any one other thing.

All the young stock is kept confined until past the danger period. They are then allowed range on alfalfa but the field is clean. Green feed s an important item in the ration.

An abundant supply of milk is always available. With this and fresh, succulent green feed the important part of the ration is supplied. A constant growth in the young stock is maintained until late fall when they are finished for market.

Each of the methods gives satisfactory results. One outstanding similarity is the important role that clean range plays. Most of the failures that are so commonly noted each season undoubtedly result from lack of attention to this fact. The turkeys and poults are allowed to range over the same ground and with the rest of the poultry. Losses occur from contaminated soil, parasites, and lack of good general sanitation.

Turkey raising has become rather a specialized branch of poultry keeping. With the average loss that most farms encounter it is rather doubtful whether they should continue along this line. A large percentage of the young turkeys is lost by blackhead and a second loss occurs on heavy rain feeding after harvesting.

It is possible for any interested party to follow the methods outlined. Clean range can be supplied. Young turkeys develop rapidly in confinement and one can obtain the necessary equipment and range to operate profitably.—J. B. HAYES.

Chickens That Lay White Eggs—Ration

HOARD'S DAIRYMAN:—Kindly tell me what strain of chickens lays pure white eggs. I would also like to have ration for laying hens for winter months.

Bantry, N. D. K. M. D.

There is considerable difference in the answer which one will give to a question of strains of chickens that lay white eggs, and this would be dependent on the fact of whether one said white eggs, or if one said pure white eggs. In the second case it is assumed that pure white may mean a flock that never at any time has any individual that produces an egg that shows any tint to it. This, I believe, is almost an impossibility, although there is a requirement that is very greatly stressed for the top grade of eggs on the better eastern markets.

One can best determine the white egg breeds by the color of the ear lobe, in that your fowls producing the white egg have a white ear lobe, and those producing the brown shelled eggs have a red ear lobe. This very nearly classifies it according to the Mediterranean fowls, being the particular producers of white shelled eggs.

Most of the better known and most prominently advertised strains of principally the S. C. White Leghorns are at this time producing eggs, the greater percentage of which will grade into top grades because of shell color, and a great deal of selection has been made along this particular line. There are always exceptions to this, and this is noted principally among the pullets during the time they are producing their first eggs.

There are a number of mighty good rations that one can mix at home that will give satisfactory results. The old standard one is what is known as the Big 5, consisting of 100 lbs. each of ground corn, ground oats, wheat bran, standard middlings, meat scrap or tankage, and 5 lbs. of salt, or one pound of fine table salt added to each 100 lbs. of the mash mixture. It is usually advisable to also give the flock access to alfalfa or to add about 10% to the mash mixture. This ration has been used to a great extent and is the one most commonly recommended by the state institutions, I believe, and is adaptable on that account.

Another ration which has obtained a considerable amount of publicity recently, and one that apparently is working satisfactorily is what is known as the Farmingdale Contest Ration, which is given below. This one is just a little bit more complicated, and probably the use of it will be limited to some extent on that account. The few scattered experiences which people have had with this, however, have been satisfactory and they have been well satisfied with results.

It is assumed also that if one is going to push for high production that cod liver oil feeding will be accepted as a part of the ration, being added at the rate of 2% to the mash, and artificial light where it is possible to use it regularly is thought of as part also of good management during the winter months.

Farmingdale Ration—100 Red Dog flour, 100 wheat bran, 100 yellow corn meal, 100 gluten meal, 100 hulled ground oats or reground rolled oats, 100 meat scrap, 50 alfalfa meal, 25 bone meal, 15 granulated charcoal, 3 pounds sulphur, 3 fine salt.—J. B. HAYES.

Feeding Hens

In your issue of March 25, I read your ration for hens—scratch feed and mash. Just what amount would you give 188 hens of the scratch feed at each feeding that as yet are confined inside, and what amount would you give them when out on open range?

The mash ration given is to be the same whether housed up or out on range, isn't it, and kept before them all the time? I feed one-third scratch feed mornings and two-thirds at night. At present, am giving a ten-quart pail of scratch feed mornings and one and one-half pails or more at night. Not knowing whether this amount was enough or too much, I ventured to ask your advice.

Randalia, Ia. (MRS.) F. D. T.

It is impossible to state definite amounts of grain feed which a flock of any definite number of hens should have. The amount of grain given to them is controlled by the development of the birds, their egg production, the time of the year, the climate, whether or not lights are being used, and a number of other factors of this sort. A person should guide grain feeding by first noticing whether or not the hens are beginning to lose weight. When the pullets are put in in the fall of the year, they are good and fat, or should be, and it is expected that some weight will be lost from this. This loss does not want to be severe, and if it is noted that they are losing this flesh, the amount of grain should be increased.

A second means of doing this is to keep increasing the amount of grain feed given to the flock at night until it is noticed that the bulk of them have their crop well filled and that no grain is left on the floor. Then about one-half of this amount should be given in the morning and that amount or twice the morning feed should be given at night. This, of course, wants to be balanced with the mash consumption, and with this system of feeding, it will be found that probably an equal amount or one-half the amount of mash will be consumed during the time that they are consuming the grain.

I might cite amounts of grain to give to a flock of 100 hens, according to monthly distribution of it, but don't have an awful lot of confidence in this method of feeding because it is a long ways from being reliable.

As you indicate, the mash hopper should be kept filled at all times, and left before them so that they can help themselves. During the summer, with an average flock under average farm conditions, I would discontinue the grain feed in the morning entirely, leave the dry mash there and just give them what grain feed they will clean up at night. This, probably, is given to you as definitely as it would be to give them 12 pounds to 100 birds in December, 10 pounds another month, and 8 pounds another month, but it is giving a person a better opportunity to check on the feeding formula and amount for their flock.—J. B. HAYES.

BROODER
New Invention
Saves your Chicks
Twin-Float Automatic Oil Control

No Adjustment of Oil Level Required

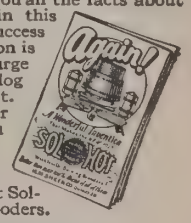
100% Safe—100% Efficient

The New 1927 Sol-Hot Wickless Brooder is the most wonderful brooder we have ever built—it is the crowning achievement in Sol-Hot's many years of undisputed leadership in the brooder field. Nothing like it—nothing that can even compare with it has ever been offered to poultry raisers before.

Ever since the first Sol-Hot Wickless Brooder was placed on the market several years ago it has grown in tremendous favor with poultrymen, because, being WICKLESS, it put an end to the troubles and endless worries caused by the inefficient, old-fashioned wick-burning brooders, which must be cleaned and trimmed daily—which splutter and smoke—burn unevenly and often go out entirely, smothering chicks with smoke from smoking wick and allowing others to get chilled and die.

This season we have invented and developed a New Improvement that makes the 1927 Sol-Hot still BETTER. It is the TWIN-FLOAT AUTOMATIC OIL LEVEL.

You can set the New 1927 Sol-Hot anywhere. It makes no difference whether your floor is level or not—you don't have to give a moment's thought to the oil level—the TWIN-FLOAT takes care of that automatically. You just light the burner—turn the valve to get the flame the size you want, and that's all there is to it. Sol-Hot will burn just as you set it as long as there is oil in the container. No danger of flame going out or flaring up—no danger of chicks being smothered from smoking burner—no danger of chicks being chilled because of heater dying down. Burner cannot go out—cannot overflow—burns an even, steady flame all the time.



The New 1927 TWIN-FLOAT Sol-Hot is the brooder of brooders—it raises more chicks—it saves trouble, work and worry. Just as simple to operate as a gas stove.

SOL-HOT TRADE MARK

Send for Free Catalog

It is impossible to give you all the facts about this wonderful brooder in this advertisement, but your success in raising chicks this season is so important that we urge you to send for our catalog telling you all about it. Don't buy a brooder of any kind until you get our free catalog and see for yourself how far superior the New Twin-Float Sol-Hot is to all other brooders. Write today!

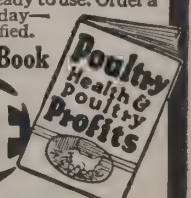
How to Tell Roup Canker

Poultry Flu, Coccidiosis and other poultry diseases

It's mighty important to know what's wrong when birds take sick. The disease may spread thru the entire flock almost overnight. Quick action is needed to stop loss. Our poultry book tells how to recognize different poultry and chick diseases,

and What to Do



This book has SAVED poultrymen thousands of dollars. It's really so easy and costs so little to **prevent disease** by feeding B-K in the drinking water and spraying with the famous B-K smoky vapor. It's simple, it's safe, it costs little and thousands of poultrymen know it's dependable.

B-K is a non-poisonous germ killer and disinfectant. Clean, clear, colorless. Leaves no odor. B-K is concentrated. Costs about 1½c per gallon of dilution ready to use. Order a jug from your dealer today—money back if not satisfied.

Write for this Free Book on Poultry Diseases

One customer says it saved him $3000.00. It may save you hundreds of dollars this very year.

This *balanced* dairy ration bears the money-back guarantee of the world's largest millers

Read what Mr. Henry J. Young, owner of Spruce Grove Farm, Barron, Wis., has to say. This is only one of such letters we are continually receiving.

"Having fed Gold Medal Vitamin feed to my Holstein Friesian cows for the last six months, will say that it is the best feed to produce results that I have ever fed."

* * *

All the ingredients in Gold Medal Vitamin Dairy Ration are so *balanced* that it is *the most easily digested ration on the market.* Thus it is completely assimilated. The milk flow quickly increases—both in quantity and in butter fat.

Our money-back guarantee

If any sack of Gold Medal Vitamin Dairy Ration does not prove absolutely up to guarantee printed on the sack, and does not prove entirely satisfactory in every way—then return unused portion to your dealer. He will refund full purchase price. We will repay him.

The reputation of the world's largest millers stands back of this guarantee. We honestly believe it is worth your while to see what a 10 day's trial will do. Order from your dealer now.

Autobiography of a Pioneer Dairyman

(Continued from page 88)

cabin and could hear all that was going on through the solid wall of logs. My chum did not have patience to sit still and watch but kept moving about. I told him that the bear would certainly hear him tramping over the log floor but this had no influence on him.

I soon dropped asleep. After a time my chum woke me and said that the bear had been there twice and gone. You will have to draw on your imagination to know how I felt. I asked him what he had been doing. I ordered him to go and lie down, and I would watch the rest of the night. The bear had been frightened away twice, and I did not expect he would come again that night.

The next afternoon about three o'clock I posted myself on watch, reasoning that as the bear got no supper the night before, he would come early. About five o'clock I saw him creep out of the woods at a point where he could look straight at the deer. This ended that hunt as I had to get back to my business.

Hunting Canada Lynx

Now, boys, I am going to tell you about a lynx hunt. I was making my home for the hunting season at the Ford River Farm some miles back in the woods from Metropolitan, Michigan. There was one camp twelve miles from the farm where I had discovered plenty of bear signs. On my way forth and back I had come across tracks of some large animal of the cat tribe, and also found plenty of rabbit tracks that this animal was evidently hunting.

The men at the farm said there had never been a panther seen in that section and that these tracks were those of the Canada lynx. As the lynx is a night hunter, to get a shot at this fellow I needed to use my headlight. This was a diminutive locomotive headlight worn on the cap and placed over the left eye so that when the head is turned to sight down the gun barrel the light is in line with the gun barrel, and one

H. B. GURLER AND LOVING CUP PRESENTED HIM BY MISSISSIPPI DAIRYMEN

kitchen window. He would walk a few feet and sit down on his haunches, bear fashion, watch a time, and then move a few feet and sit down again. He repeated this until he was near enough so I could get him with the shot gun.

I had lost confidence in my chum the night before as he failed me completely and I could not guess what he might do at the second chance. I called him to the window and when the bear was near enough we both shot. My friend made a beautiful shot, and I tore his neck, breaking the bone into several pieces with the buck shot.

My chum collapsed with a sick headache and went with his blanket into the dining room and laid down on the floor. There was a den of skunks under the floor. They crawled up the logs and commenced investigating. But he knew skunks better than I and lay perfectly still. The skunks left not a bit of their liquid.

The next morning we skinned the bear, and after getting our breakfast started for home. It was twenty miles through the woods and twelve miles out to the railroad. We had our guns, blankets, and the bear skin to pack. A green bear skin is a fairly good load to pack of itself.

We got home in the afternoon in time for me to go out and kill a nice shoots at the reflected light of the animal's eyes.

I had planned that I would go out some very dark night and try to get a shot at him. On the way to the lynx hunting ground I ran into a family of young skunks, and it was laughable to see them perform when the light was turned on them. I had a lot of fun with them until they went away. I wore moccasins and followed a supply road so there was no danger of getting lost and nothing to fear from any source.

While going through a patch of sweet fern I caught a pair of yellow lights like a cat's eyes. I lost no time in getting my gun in position and letting go one barrel of a ten gauge loaded with buck shot. I had to guess where the animal's body was so I shot a little low, thinking I might get him in the neck. But when I got to him I found I had given him a lengthwise shot killing him so dead that I could not hear a movement of the body.

I felt I had done a pretty neat job. Tying his legs together, I slung him over my shoulder and started on my six-mile hike back to the farm, reaching there at two o'clock in the morning as happy as I was when I caught my first one-pound brook trout when a boy in New Hampshire.

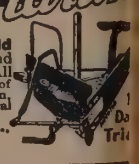
Talk Number 6

Are You Killing Off All Your Buffaloes?

"Willful waste makes woful want," and to rent is to waste.

Fifty years ago great herds of buffalo roamed the plains of America and afforded the plainsmen an ever ready commissary. Hunger was unknown. Even in the most unfrequented sections of the Middle West, a delicious dinner of half beef, half venison flavor was a matter of a few moments only, and the meat course of the pioneer's meal was always fresh.

But the farmers of the East were buying buffalo robes to keep themselves warm when they drove to town on winter mornings. Robe dealers were paying a pittance for the hides and the plainsmen were short-sighted. Day after da they stalked the magnificent herds. Thousands and tens of thousands of carcasses were left to decay on the ground every year. No more willful waste is recorded in history, and the plainsman lived to see the result of his folly. He awoke one morning to the realization that the buffalo was gone. His kind was all but extinct and the plainsman had profited practically nothing from his wholesale slaughter.



The buffalo was the victim of thoughtlessnes and mismanagement in the time of plenty. H was like your rent dollar. One by one your ren dollars drop into your landlord's pocket, an you get in return even less than the plainsma realized on his hides.

Have you ever counted the rent dollars tha have gone that way? Figure it up—then thin where you might be today if you had applie them to a good piece of dairy farm land in Wi consin. It isn't too late. Write now and let u explain how you may store your rent capital an become an owner of a fine dairy farm in th greatest dairying State in the Union.

Some Cow Testing Benefits

THE story of the value of cow testing association work is so effectively told in a new circular from the Wisconsin College of Agriculture that we are persuaded to pass parts of it on to our readers in the hope that the appeal will find fertile lodgment in the minds of many who are not fully convinced of the merits of the work.

In telling the story the experiences of several members of associations are related, experiences typical of many thousands that could be found among dairymen who have tried the work and found it good. The best part of the story is that these experiences may be written in the language of dollars and cents.

Dairyman Saved $343

A new member in the Waunakee Association received the tester the first month with a feeling that he would not get back the value of his membership fee which was $40. The tester on checking up the skimmilk found the separator putting 1.9 per cent of butterfat into the skimmilk. This was 42 per cent of the daily production in fat. This discovery translated into dollars and cents saved this dairyman $343 the first year. Before joining the association he did not know what was wrong. He put his suspicions in the wrong place—on the creamery and on his cows.

Better Cows Increased Profit

A grade Guernsey herd tested for 3 years in the Thiensville—Lakefield Association originally consisted of 13 cows which averaged 277 lbs. fat the first year. The average feed cost was $74.34. The third year the herd was culled to 8 cows and their average was 368.6 lbs. fat; their average feed cost was $93.31. With butterfat at 50 cents a pound and no credit given for the skimmilk, the average return above feed cost the first year was $65.16; the third year, $90.99.

Balanced Ration Pays

A member of the Whitewater Association had 10 cows the first year in the work; he did not pay much attention to feeding. He fed silage, mixed hay, and ground oats; his feed bill was $47.40 for each cow or $474. For this expenditure he received $1,130 for butterfat, leaving $656 above feed cost.

The second year he fed silage, alfalfa hay, and a concentrates mixture composed of 100 lbs. each of corn meal, ground oats, bran, and 50 lbs. of linseed meal. His feed cost was $65.40 per cow or $654 for which he received $1,505, leaving him $851 above feed cost for the ten cows. Translated into terms that anyone can understand, this dairyman learned from the tester how to feed his cows for which he received $19.50 more from each cow than he would have received had he not gained this knowledge.

Summer Grain Feeding Profitable

A twelve-year-old Guernsey cow in the Genesee—Eagle Association produced 1,117 lbs. more milk for the four summer months she was fed grain than during the same period a year before when no grain was fed. Her grain cost $13.75 while the increased milk brought $33.50, leaving $19.75 net after paying for the additional feed.

Testing Finds Unprofitable Cows

A member of the Whitewater Association kept a poor cow on test two years, thinking the second year would be better. The first year this cow produced 241 lbs. of fat at a feed cost of $48. The second year she produced 229 lbs. fat after the feed cost had been increased to $58. This cow put on flesh and was soon headed for the butcher.

Testing Saves Good Bull

The Thiensville—Lakefield Association saved a valuable bull for one of its members because the records showed that the first 2-year-old daughters of this bull averaged 52 lbs. fat more than their dams as mature cows. Translated into dollars and cents the saving of this one bull was worth nearly as much as all the members of the association paid in a year as fees, provided the bull was given an opportunity to exercise his full usefulness after it was discovered that he had prepotent power to transmit producing ability to his daughters.

Helps Grade Up the Herd

Two brothers, members of the Augusta Association, said: "We did semi-official testing while we were members of the C. T. A. The official record of one cow in class D showed a production of 433 pounds fat while the C. T. A. record showed 429 pounds fat. This indicates the association work is a reliable index of the producing ability of cows when properly fed. Cow testing taught us how to pick our best cows for breeding foundation and it also helped us to check up the sire through the production of his daughters."

Helps Increase Alfalfa

Not all the gains from the association work are measured directly by the scales and Babcock test. The first sign of gain usually comes when the new member becomes interested in feeding his cows the way cows should be fed. The next sign of improvement comes when the new member realizes that some changes should be made in the crops he is producing.

Just how much influence association work has on bringing about this change is hard to say. In this connection it is significant to note that of 443 members in 18 associations 419 or 94 per cent are growing alfalfa. Anything that promotes the growing of alfalfa on dairy farms is worth looking into by everyone who would add to their net income.

Better Living Standards

If some of the gains of cow testing association work did not find place in better living standards of those who participate in the work the story would not be complete.

We have selected at random from such annual reports as we have available some data that indicate that the gains from this work do find place in better standards of living.

Of the 22 members in the Caledonia—Mt. Pleasant Association, 11 have radios, 21 have automobiles, and 18 have electric lights.

Of the 123 members in 5 associations in Pierce County, Wisconsin, 69 have running water in their homes, 122 have automobiles, 40 have radios.

Of the 25 members in the Waunakee Association, all have automobiles, 15 have gas or electric lights, and 10 have running water in their homes.

Of 122 members in 5 associations in Waukesha County, 46 have water systems in the home and 114 have automobiles.

Washington County has 7 associations with 173 herds tested last year. Among the members, 52 have water systems and 181, automobiles.

The average cost per year of a membership in a cow testing association is about $40. We recommend it not only as a safe investment but also as one that will return a good dividend.

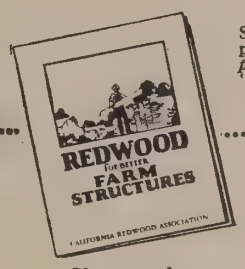
First Cost Is *Last* Cost

when you build with

California Redwood

THAT building is most economical that costs least to erect *and maintain.*

Make First Cost Your Last Cost by using California Redwood, which is impregnated by nature against decay.



Even the *first* cost of Redwood is not high—it compares favorably with costs of other *good* lumber.

Four centuries before Columbus discovered America a great Redwood tree—then 600 years old—blew down. Another tree sprouted, and grew astraddle of it for 1000 years, by actual count of its annual rings. Then the fallen Redwood—still sound as a dollar—was cut into Siding, Finish, Barn Boards and Fence Posts!

Besides being durable, Redwood works easily with a minimum of waste, is light and strong; "stays put" without warping, checking, splitting.

Defy Decay. Use Rot Resisting Redwood. Be Done with Up-keep!

Do Your Grinding Faster And At Lower Cost

FOR grinding feed, graham flour and rye flour, this mill gives you greater capacity per horse-power and lower grinding cost per bushel than any other farm grinder. It makes home grinding most profitable, saves hauling and other expense.

HOWELL *Roller Feed Mill*

Built on same principle as large custom mills—grinds by the modern scientific roller process. No buhrs or stones to wear out. Grinds twice as fast with the same power required by any other type of mill, thus cutting grinding expense in half. Will not heat the feed. Guaranteed to get the wild oats.

Made in 13 sizes—any capacity—a size for any engine.

Catalog sent FREE upon request

Should Rates for Luxury Travel Be Reduced?

A persistent and serious effort is being made to get Congress to pass a law abolishing the "surcharge" that passengers now pay the railways when they ride in sleeping or parlor cars rather than in day coaches.

There are at least three unanswerable reasons why farmers should urge their senators and representatives in Congress to vote against this legislation.

First, the passenger in a sleeping or parlor car should pay the railway more than the passenger in a day coach, because it costs the railway more to carry him and he is given luxury service.

Second, the railways get $40,000,000 a year from the "surcharge," of which the western lines receive $16,000,000. If they are deprived of the money from this source, they will have to get it through freight rates.

Third, the Interstate Commerce Commission first authorized the "surcharge" and later has upheld it as reasonable. It has said "whatever capacity the railroads may have for rate reduction should be utilized for the benefit of other forms of traffic." For Congress to pass a law abolishing the "surcharge" would be for it, under political pressure, to overrule a deliberate decision of the commission fixing rates. Rates should be fixed by the Commission, not by Congress. It was because the public did not want regulation to be subject to political influence that it caused an expert and judicial investigating body such as the Commission to be created.

It is respectfully suggested that it will be to the interest of farmers to let their senators and representatives know what they think about this matter.

WESTERN RAILWAYS' COMMITTEE ON PUBLIC RELATIONS

740 Transportation Building, Chicago, Illinois

We Needed One and So Do You

Many times at sales, farmers' meetings, on the street, in hotels, on trains and even at dances we have been asked for information regarding the Hoard's Dairyman herd. We missed many sales because we could not give our friends and new acquaintances all the information they wanted in definite form. In order to "be prepared" for these emergencies we planned the Hoard's Dairyman Vest Pocket Herd Book. The demand for them is exceeding our highest expectations The investment of $2.00 will come back to you many times and the satisfaction of having "your figgers" right handy is worth much more than the cost of the book.

Will accommodate 100 head. Loose leaves (easy to remove but firm during use); good leather cover; index, sketches, records breeding, service records, gestation table and blank pages for memoranda. All sent postpaid for $2.00.

A BOOK YOU WILL CARRY EVERY DAY

HOARD'S DAIRYMAN, Fort Atkinson, Wisconsin

A Fad That Became a Leading Crop

(Continued from page 57)

made Ontario preeminent as an alfalfa producing province.

Drainage Essential

Physicians claim that many human ills may develop from "wet feet." Alfalfa in this respect is very like the members of the human family. It cannot survive on land where its roots are constantly wet. Drainage is therefore essential for its well being. The Ontario farmer has, fortunately, been the recipient of nature's legacy in the form of land with a rolling topography which is so ideal from a drainage standpoint for the development of good alfalfa crops.

Acid Soils Unadapted to Alfalfa

Most folks like their food sweet rather than sour; so does alfalfa. This plant has no appetite for the food of sour soils and it will not thrive on soils which, when analyzed, give an acid reaction. The soils of Ontario farms are to a large extent sufficiently sweet, because of their content of lime, for the establishing of profitable alfalfa crops. Where acid soils do exist, facilities for the manufacture of ground limestone and for the distribution of it to the localities where it is needed are now fairly adequately provided.

Nitro-Cultures Assist

When Hermann Hellriegel in 1886 discovered the fixation of atmospheric nitrogen by leguminous plants through the medium of bacteria in the nodules on their roots, he made an inestimable contribution to mankind. Outgrowing from this discovery came the laboratory preparation of cultures or colonies of bacteria with which to treat the seed of alfalfa and other legumes in order that the production of these desirable nodules filled with minute organisms might be stimulated and the legume associated increased in growth. Reports from farmers who received alfalfa cultures from the Dominion Bacteriologist at the Central Experimental Farm at Ottawa have indicated that the crops of 90 per cent of those who have grown alfalfa for the first time have been benefited by this seed inoculation. The accessibility to the farmers of Ontario to these billions of microscopic workers found in alfalfa cultures is another factor which has furthered the cause of alfalfa in many districts of Ontario where it had never been grown before.

Home-grown Hardy Seed Now Plentiful

The winters are cold up here in Ontario but they favor hardy constitutions. Canadian grown alfalfa seed has acquired the characteristics of the people and winter-killing is practically unknown when home-grown seed is sown. In 1925, Ontario produced 90,000 bushels of hardy Ontario variegated alfalfa seed. This seed was sold at prices, in most cases less than that asked for red clover. Dr. Zavitz in a recent radio address stated that Ontario variegated alfalfa having passed through a rigorous climatic process of elimination for over 50 years has become peculiarly well suited to the conditions of Northern and Eastern America. It originated from a blend of hardy variegated varieties coming from Alsace—Lorraine and the neighboring district of Baden, the latter being the original home of the Grimm.

The production and use of Canadian grown seed has, I believe, done more to stimulate the growth of alfalfa in Ontario than has anything else. Countless farm trials with alfalfa in the past were unsuccessful because southern or European grown seed was sown. This difficulty has now been largely overcome by the production of hardy seed right at home.

Alfalfa production in Ontario is hardly past its infancy and although its rate of increase in the future may baffle prophesy there can be no doubt that when any farm practice has gripped the farmers of Ontario, as has the growing of alfalfa in the past five years, that practice has not only come to stay but is certain to fill a much larger place on the valleys, plains, and rolling fields of Ontario in the years to come.

Future of the Pure-Bred Business

(Continued from page 78)

made "through rigid selection based on profitable production." There in one phrase of seven words is a comprehensive summary of all methods of breed improvement. If a short statement of methods of breed debasement be sought it can be found in the pure-bred practice of registering and breeding from scrubs. And so while the grades breed up, large portions of pure-bred cattle breed down, until we reach the point where grades and pure-breds are not far from equal in average productivity, with the advantage on the side of the grades that they are much cheaper to buy.

Then, what is the future of the pure-bred business? The answer is plain,—that if the pure-bred is to continue to have a special value greater than the value of other cattle, the breed associations must adopt some system so that pure-breds, at least as much as grades, will be bred by "rigid selection based on profitable production." It is impossible to register inferior animals and hold a superior position. Moreover, it is not easy to regain a superior position after it has been lost. The time for the breed associations to take whatever action is necessary to save their places in the dairy world is right now. As Mr. Canan well says, "we see conditions which make us feel it is imperative that immediate consideration be given this problem."

The question before the breed associations is not difficult to answer. Some action to exclude inferior animals from registration is inevitable. That is the whole story. The difficulty is that breeders do not like to discard animals and for this reason all the associations delay to take action, and when finally action is taken there will be a tendency in some associations to make requirements as low as possible, so that few animals will be excluded. Nevertheless, no half-way measures will meet the needs of the situation. So long as there is "rigid selection of grades based on profitable production," just so long will the pure-bred have to compete with the high-producing stock which rigid selection develops. The associations which adopt half way measures will in the end fail to meet this competition. Any association, on the other hand, which establishes a system of rigidly selective registration based on profitable production, will not only save its own prestige and the value of its animals, but will more and more take up and occupy the field of those breeds whose associations fail to establish adequate safeguards for the reputation of their stock.

Ayrshire Cattle in the United States

(Continued from page 59)

ficial yearly records, up to June 30, 1926, are listed below:

Sire	No. of daughters
Beuchan Peter Pan	57
Finlayston	55
Baron's Best of Bargenoch	47
Earl's Choice of Spring Hill	43
Kate's Champion of Penshurst	38
Nox'emall	35
Netherton Statesman	32
White Cloud of Hickory Island	32
Kate's Good Gift	30
Penshurst Rising Star	28

The offices of the Ayrshire Breeders' Association are located at Brandon, Vermont. C. T. Conklin is secretary.

Scale of Points for Ayrshire Cow

HEAD	10
FOREHEAD. Broad and clearly defined	1
HORN. Wide set on and inclining upupward	1
FACE. Of medium length, slightly dished; clean cut, showing veins	2
MUZZLE. Broad and strong without coarseness, nostrils large	1
JAWS. Wide at the base and strong	1
EYES. Full and bright with placid expression	3
EARS. Of medium size and fine, carried alert	1
NECK. Fine throughout, throat clean, neatly joined to head and shoulders, of good length, moderately thin, nearly free from loose skin, elegant in bearing	3
FOREQUARTERS	10
SHOULDERS. Light, good distance through from point to point but sharp at withers, smoothly blending into body	2
CHEST. Low, deep, and full between back and forelegs	6
BRISKET. Light	1
LEGS and FEET. Legs straight and short, well apart, shanks fine and smooth, joints firm, feet of medium size, round, solid and deep	1
BODY	13
BACK. Short and straight, chine lean, sharp and open jointed	4
LOIN. Broad, strong, and level	2
RIBS. Long, broad, wide apart and well sprung	3
ABDOMEN. Capacious, deep, firmly held up with strong muscular development	3
FLANK. Thin and arching	1
HIND QUARTERS	11
RUMP. Wide, level, long from hooks to pin bones, a reasonable pelvic arch allowed	3
HOOKS. Wide apart and not projecting above back nor unduly overlain with fat	2
PIN BONES. High, wide apart	1
THIGHS. Thin, long and wide apart	2
TAIL. Fine, long and set on level with back	1
LEGS and FEET. Legs strong, short, straight, when viewed from behind and set well apart; shanks fine and smooth, joints firm, feet medium size, round, solid and deep	2
UDDER. Long, wide, deep but not pendulous nor fleshy; firmly attached to the body, extending well up behind and far forward; quarters even; sole nearly level and not indented between teats, udder veins well developed and plainly visible	22
TEATS. Evenly placed, distance apart from side to side equal to half the breadth of udder, from back to front equal to one-third the length; length 2½ to 3½ inches, thickness in keeping with length, hanging perpendicular and not tapering	8
MAMMARY VEINS. Large, long, tortuous, branching and entering large orifices	5
ESCUTCHEON. Distinctly defined, spreading over thighs and extending well upward	2
COLOR. Red of any shade, brown, or these with white; mahogany and white, or white, each color distinctly defined. (Brindle markings allowed but not desired.)	2
COVERING	6
SKIN. Medium thickness, mellow and elastic	3
HAIR. Soft and fine	2
SECRETIONS. Oily, of rich brown or yellow color	1
STYLE. Active, vigorous, showing strong character, temperament inclined to nervousness but still docile	4
WEIGHT. At maturity not less than 1,000 lbs.	4
Total	100

HEAD	16
FOREHEAD. Broad and clearly defined	2
HORN. Strong at base, set wide apart inclining upward	1
FACE. Of medium length, clean cut, showing facial veins	2
MUZZLE. Broad and strong without coarseness	1
NOSTRILS. Large and open	2
JAWS. Wide at the base and strong	1
EYES. Moderately large, full and bright	3
EARS. Of medium size and fine, carried alert	1
EXPRESSION. Full of vigor, resolute and masculine	3
NECK. Of medium length, somewhat arched, large and strong in the muscles on top, inclined to flatness on sides, enlarging symmetrically toward the shoulders, throat clean and free from loose skin	10
FORE QUARTERS	15
SHOULDERS. Strong, smoothly blending into body with good distance through from point to point and fine on top	3
CHEST. Low, deep and full between back and forelegs	8
BRISKET. Deep, not too prominent and with very little dewlap	2
LEGS and FEET. Legs well apart, straight and short, shanks fine and smooth, joints firm, feet of medium size, round, solid and deep	2
BODY	18
BACK. Short and straight, chine strongly developed and open jointed	5
LOIN. Broad, strong and level	4
RIBS. Long, broad, strong, well sprung and wide apart	4
ABDOMEN. Large and deep, trimly held up with muscular development	4
FLANK. Thin and arching	1
HIND QUARTERS	16
RUMP. Level, long from hooks to pin bones	5
HOOKS. Medium distance apart proportionately narrower than in female, not rising above the level of the back	2
PIN BONES. High, wide apart	2
THIGHS. Thin, long and wide apart	4
TAIL. Fine, long and set on level with back	1
LEGS and FEET. Legs straight, set well apart, shanks fine and smooth, feet medium size, round, solid and deep, not cross in walking	2
SCROTUM. Well developed and strongly carried	3
RUDIMENTARIES, VEINS, ETC. Teats of uniform size squarely placed, wide apart and free from scrotum; veins long, large, tortuous with extensions entering large orifices, escutcheon pronounced and covering a large surface	4
COLOR. Red of any shade, brown, or these with white; mahogany and white, or white, each color distinctly defined	3
COVERING	6
SKIN. Medium thickness, mellow and elastic	3
HAIR. Soft and fine	2
SECRETIONS. Oily, of rich brown or yellow color	1
STYLE. Active, vigorous, showing strong masculine character, temperament inclined to nervousness but not irritable or vicious	5
WEIGHT. At maturity not less than 1,500 lbs.	4

[EDITOR'S NOTE: This is the second of a series of six articles on the dairy breeds in the United States. The next will appear in an early issue.)

Windbreaks

HOARD'S DAIRYMAN:—Three agencies in the state, viz.: The Extension epartment, University of Minnesota; College of Forestry, University Minnesota; and the State Forestry epartment have recognized the imortant part which windbreaks and helterbelts play in rural and state evelopment, and as a consequence ave for a few years been establishg demonstration areas for the purpose of showing how windbreaks should be planned as well as clearly pointing out species which are most adapted to the use required.

These demonstration areas are now handled entirely through the respective county agents whose duty it is to recommend good, outstanding farmers who will take on such a demonstration, prepare their land properly, and follow instructions given. Only two demonstrations per township are allowed, however, and usually only three to five per county in any one year as the quantity of stock available is limited. Trees are furnished to co-operators at cost, that is, $1 per hundred or fraction thereof, plus the express from the nursery.

The co-operator must own and live on the land where the demonstration is to be placed. Applications for demonstrations are made out on forms furnished by the county agent and later sent to the Extension Forester at University Farm. One important prerequisite before trees are furnished is that the land must be prepared at least one year prior to actual planting by putting it in some cultivated crop like corn or potatoes to insure proper cultivation, conservation of moisture, and what is more important to keep the land free from competing weeds and grasses.

For the actual windbreak only standard plans are submitted, that is, no plans are drawn to fit the farm. The farm itself must fit the plan; in other words, it must be situated so that a windbreak can be planted on the north and west sides. Such a planting will, therefore, be at right angles to the prevailing storm winds of the region.

For best results such a planting should not be any closer to the building than 100 feet, and should extend 400 feet on the north side and 400 feet on the west side. Such a windbreak gives adequate room for an orchard between the windbreak and the house, besides furnishing the maximum protection to the farm house, barns, chicken house, etc.

Minnesota. P. O. ANDERSON.

A hundred pounds of skimmilk is estimated to be worth six times the market price of a pound, live weight, of hogs or half the market price of a bushel of corn when fed to hogs. It is worth more than this when fed to young calves, chickens, pigs, or colts.

Prof. Evvard's Inspiring New Book

Prof. Evvard's new book, "Minerals and Feeding," has my unqualified endorsement, and I want to place a copy in the hands of every feeder in America. This book announces new and astonishing advancements in the feeding of livestock. It contains page after page of intensely interesting questions and answers on the vital problem, *how to feed to increase production and to insure greater livestock profits with actually less feed and delay.* It gives a wealth of feeding information and is the most complete book on Mineral nutrition ever published.

Information of Priceless Value FREE

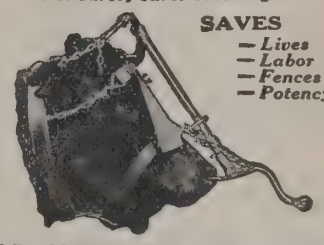
Told in simple words. Easy to read. Easy to understand. A book written by Prof. John M. Evvard of Iowa Agricultural Experiment Station, an authority of the highest standing. This book is an exclusive reproduction of a series of remarkable, up-to-the-minute articles recently prepared for the farm press. I want every livestock and poultryman to fill in and mail the following coupon. I will gladly mail this $1.00 book to you absolutely free. Read it carefully. If after reading it you agree with me that it is one of the most timely and valuable books on feeding that you have ever read and you wish to keep the book as a permanent reference, merely send me 25c to help defray the postage and publishing expense. If you do not feel that this valuable book is worth many times the small sum of 25c you may keep it absolutely free with my compliments, for I want every stock feeder to use this book.

JAMES H. MURPHY, President
Murphy Products Co., Dept. 110 Burlington, Wis.

MURPHY'S Minerals

Save many times their cost in other feeds. Endorsed by veterinarians and stockmen everywhere. The only mineral feed sold under a positive written guarantee of satisfaction or money back.

JAMES H. MURPHY, President,
Murphy Products Co., Dept. 110 Burlington, Wis.



Please send me without charge Prof. Evvard's book, "Minerals and Feeding." I feed.....head of cows.....head of hogs.

Profitable Returns

The udder and teats are the "final word" on your dairy profits. Keep them healthy, pliable, easy to milk, and you avoid endless annoyance and definite loss. No amount of care and feeding can overcome the effects of neglect of these important organs.

For most cuts, chaps, cracks or bruises Bag Balm will effect a healing between milkings. The wonderful soothing, penetrating power of this ointment restores injured tissues before you would think it possible. For all inflammation, Caked Bag, Bunches, Cow Pox, or for any external sore Bag Balm has no equal. It cannot taint the milk. Once used you will never be without it. It has scores of uses on the farm.

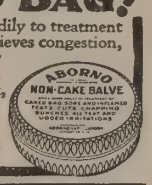
Bag Balm, in the big 10-ounce package, 60c at feed dealers, general stores, druggists. Will mail, postpaid, if your dealer is not supplied.

Dairy Association Co.,
Incorporated
Lyndonville, Vt.

BAG BALM

"MADE BY THE KOW-KARE PEOPLE"

LOWELL'S COW CLEANING PRESCRIPTION



Is Guaranteed to cause the cow to clean within 48 hrs. when used as directed or money refunded. It relieaves GARGET and is a preventative of MILK FEVER. It has the effect of restoring the vigor and strength of the cow. Sent post paid, $1 a pkg. 6 for $5
Mfg. by Lowell Blaisdell & Co.
5904 N. Harlem Ave. CHICAGO, ILL.

Mark your Calves early

Use the C. H. Dana system to mark your calves as soon as dropped. Identity of ownership prevents confusion and loss. Easily applied, cheap and permanent. Send for free samples. Also herd books, bull rings, and complete line of breeders' supplies. Write for catalog.
C. H. DANA CO.
55 Main St. West Lebanon, N. H.

END CAKED BAG!

Caked bag and sore teats yield readily to treatment with Aborno Non-Cake Salve. Relieves congestion, stops soreness, softens tissues. Every dairy farmer should keep it on hand for time of need. Send 75c for 9 oz. box, prepaid—money back if not satisfied.

DON'T WEAR A TRUSS

MR. C. E. BROOKS

BE COMFORTABLE—Wear the Brooks Appliance, the modern scientific invention which gives rupture sufferers immediate relief. It has no obnoxious springs or pads. Automatic Air Cushions bind and draw together the broken parts. No salves or plasters. Durable. Cheap. Sent on trial to prove it's worth. Beware of imitations. Look for trade-mark bearing portrait and signature of C. E. Brooks which appears on every Appliance. None other genuine. Full information and booklet sent free in plain, sealed envelope.
BROOKS APPLIANCE CO., 219 State St., Marshall, Mich.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Relieving Choked Cattle

It sometimes happens that a piece of root or mass of dry feed lodges in a cow's gullet, quickly causes bloating of the paunch, high up in the left flank, discharge from the nostrils, return of feed and water by that route, and weakness and absorption of poisonous elements. If not relieved, such choking soon proves fatal and the assistance should be prompt and intelligent.

One veterinarian has suggested a novel plan of relief, especially for the horse in which animal it is not safe to use a probang to force the lodged object downward. He fills two 1 ounce gelatin capsules with bicarbonate of soda (baking soda), slits the side of each capsule and then thrusts the two into the gullet, by way of the mouth. Doing so, he says, causes generating of gas which distends the gullet so that the blocking substance passes downward. That treatment would also seem worth trying in choke of cattle.

Administration of small doses of raw linseed oil, cottonseed oil, or slippery elm bark decoction, at intervals of an hour, lubricate the gullet, soften the lodged mass, and help it to pass downward. Such treatment always should be given before starting to massage a lodged mass of dry feed and trying to work it upward or downward. Doing so will also facilitate removal of a root by way of the mouth. It must also be done before running a probang, oiled rubber tube, or greased, smooth hempen rope down the gullet and by its means helping to force the lodged object downward. Such an operation must be gently and judiciously done, as there is great danger of badly injuring or even rupturing the gullet by rough use of such an instrument or a buggy whip or flexible stick. Gangrene of the gullet usually follows injury by the improvised probang, especially in the horse. Rupture of the gullet quickly results in escape of gas which distends the skin and soon spoils the meat. It is incurable and when it happens, or it is seen that the choke cannot be relieved, the animal should immediately be slaughtered for meat, provided it is in fit condition.

Veterinarians give hypodermic treatment with arecolin, pilocarpin, or some other alkaloidal drug to relieve choke, in addition to local treatment, and such an expert should at once be employed for the treatment of a valuable animal. If it is found severely bloated on his arrival his first act will be to draw off the gas by tapping the paunch with a trocar and canula. When that is done the lodged object sometimes immediately passes downward into the stomach. It should always be done before giving other treatment, when the distension is severe and the animal is evidently threatened with suffocation.

While a hen's egg, which sometimes causes choke, may sometimes be crushed in the gullet, it is cruel and dangerous to attempt crushing of a root by placing a piece of board on each side of the gullet, at the place where the object has lodged, and then striking a hard blow with an axe or sledge hammer. The object may be crushed by such brutal means but the gullet will also be crushed with the result that fatal gangrene will ensue. When the medicinal and local treatment fails and it is not desired to slaughter the animal for meat, the veterinarian can remove the lodged object by opening into the gullet. The earlier that operation is performed the safer it will prove.

Cowpox

Please explain the cause of cowpox and the best treatment for a cure.
Logansport, Ind. J. D. H.

Cowpox is *variola vaccina* and is caused by a specific virus which cannot be seen with a powerful microscope and passes through a porcelain filter. It is therefore called an ultramicroscopic filterable virus. A person convalescing from smallpox or recently vaccinated against that disease may infect the cows he milks. Cowpox may also affect a milker's hands and the attack immunizes the person against smallpox. The disease has to run its course of about 20 days but in cows only affects the teats. New crops of papules may form as others heal. The chief object of treatment should be to prevent spread of the disease and infection of the sores. Isolate affected cows. Have them milked by one who does not attend to other cows. Several times daily bathe affected teats with hot water containing all the boric acid it will dissolve. Each evening swab the sores with a 2 per cent solution of mercurochrome and dust with bismuth subnitrate. Keep the stall floors clean and freshly bedded.

Failure to Breed

My 20-month-old heifers fail to come in heat now. They came in all fall and summer very regularly but have not been in heat the last six weeks. Is there anything that I could feed that would throw them in heat immediately so they will freshen early next fall?
McLean, Ill. E. A. L.

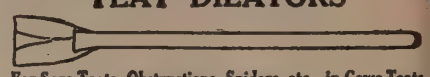
Massage the ovaries, by way of the rectum, to rupture cysts or dislodge persistent "yellow bodies" is the surest way of bringing in a period of heat but can only be done by a qualified veterinarian. Until an expert can be employed try the effect of syringing out the vagina 2 or 3 times a week, with blood warm (100°F.) boiled water tinged light pink with permanganate of potash. Also feed a complete ration including alfalfa hay and minerals.

Is the Bull to Blame

I like your advice on all dairy subjects so would like to know your opinion on a purebred bull which for two years has bred nearly all bull calves; say, only one or two heifers out of about twenty calves. As I want heifers this is a great loss, but this bull has very good breeding and is a good individual. I hate to part with him. Do you think he is to blame for the bull calves and will next year's crop be the same, all bulls?
Hillsboro, Wis. F. G.

It cannot safely be concluded that the bull is to blame. Nature "balances her books" between males and female offspring and it is quite likely that the next crop of calves may have the usual proportion of males and females. We cannot confidently state that such will be the case, however, as that is a matter no one can correctly predict.

Abortion Infection



Would it be advisable to breed cows to a bull where there was abortion last spring? The bull hasn't served any cows for 5 months.
Richland Center, Wis. E. C.

It should be safe to use the bull for service in a place not visited by affected cows. Infection of the contagious abortion disease is chiefly spread to susceptible cows by feed contaminated by the vaginal discharges of affected cows. The bull is no longer considered a fertile source of infection.

Ergot

Some place in my reading I have seen that rye contains ergot and that it has a deleterious effect on the uterus of animals which eat it. I have been planting rye in my alfalfa every year and then cutting it with the hay in June. The heads never became ripe, and I have been wondering whether they contain enough ergot to impair the breeding qualities

PURPUL MEDICATED WAX TEAT DILATORS

For Sore Teats, Obstructions, Spiders, etc., in Cows Teats
Sold by Dealers or Mailed Postpaid. 25c doz. or 5 doz. $1.00

TESTIMONIALS

BARREN COWS Wanted!

We guarantee to teach the average breeder or herdsman how to make barren cows breed, keep cows breeding, the truth about abortion, remove the afterbirth without pulling, diagnose pregnancy, disease prevention, male sterility and a good working knowledge of the generative organs. This school was originated 17 years ago and has run continuously without a dissatisfied student. We cover the breeding troubles only.

At the school we kill cows, hang them up with the sides open where the students make actual demonstrations. Fresh, warm generative organs are used in large numbers. A practical course is given in the breeders' language. A special education not necessary.

By our car fare plan the student living 400 miles from the school can attend nearly as cheap as those near the school. An instructor visits each student after he attends school. This co-operation is continuous without extra charge.

of my herd, because I have had considerable trouble getting some of my cows with calf.
Nephi, Utah. A. E. W.

Large quantities of ergot of rye in feed may cause abortion, but ordinary amounts do not have that effect nor have we ever suspected ergot as a cause of barrenness or "shy breeding." However, an examination should be made to determine how much ergot there is in the feed. It may be added that we see no advantage in seeding rye with the alfalfa and that might as well be discontinued. As infection of the contagious abortion disease is such a common cause of barrenness we should advise you to have a sample of blood from each cow and heifer tested for that infection at the state experiment station, veterinary division.

Leaking of Milk

I have a Jersey cow that gives about four gallons of milk a day but she loses some as it drips from her for quite a while before I milk her. What could I do for her to help her hold her milk? This cow has a very large udder for the amount of milk she gives. It is just about as large after I am through milking as when I start. Is there any way to work this beefiness away?
St. John, Kansas. S. M.

Milking 3 times daily may prevent the leaking of milk or let a calf nurse. If you do not care to do so, then dip the tips of the teat into tincture of iodine and work a little of it into the opening of each teat. Repeat the application when required. A fleshy udder is natural and cannot be improved by treatment.

Abortion Infection

I have 30 Holstein cows which I bought in 1923. They all freshened that spring. Now I have 8 of them I can't get with calf. They don't come in heat regularly. I also have one that shows no signs of coming in heat at all for the last 18 months. I also have one that never goes out of heat. I was troubled some with garget with some of these cows. I also have some cows in my herd whose milk is watery in one or two teats at first, then when they let down the milk it seems all right.
Arco, Idaho. R. M. K.

There can be little doubt that your herd has become infected with the contagious abortion disease. To determine that, however, you should have a sample of blood from each animal tested by the agglutination method at the state experiment, veterinary division. Your veterinarian can attend to that. He should also massage the ovaries of the cow that does not come in heat, to rupture cysts or dislodge persistent "yellow bodies." That treatment may also help some of the cows that have irregular periods of heat. Meanwhile isolate all affected cows and cleanse, disinfect, and whitewash the stable, including the floors and gutters. The cow that is in heat all of the time might as well go to the butcher. This is also the best course as regards cows that have chronic garget as that disease is incurable when established.

Apples for Cows

I have about 500 bus. cull apples that I would like to feed to my cows this winter. I was figuring on about 20 lbs. to the cow per day. Is this amount O. K.? A veterinarian told me if I did so, the cows' stomachs would become paralyzed and the result would be a decrease in their milk flow. Later a farmer stated he had put his whole herd dry in this way a few years ago. Can this be the case unless the cows were overfed? Of course I know an overdose of almost anything would kill a cow and all has to be fed with judgment.
Belleville, Penn. A F. G.

For dairy cows apples are said to have about 40 per cent of the value of corn silage and apple pomace is practically equal to the same weight of corn silage. Apple pomace silage at the rate of 24 to 35 pounds a day per cow is as much as an animal will eat in addition to 8 lbs. of grain and 10 to 12 lbs. of hay. The apple-pomace silage had no deleterious influence on the cows or their milk (Vermont report 1903). Better make cider of the cull apples and feed the pomace to cows along with plenty other feed. It is commonly believed by dairymen that when apples are heavily fed the milk yield will materially lessen if not dry off. Judiciously fed, apples have not that effect and possibly may prove beneficial in laxative effect.

Warts

I wish information on killing seed warts on cows' feet.
Guthrie, W. Va. E. D. H.

The warts should in time disappear if you keep the affected parts well covered with a thick paste of pure castor oil, salt, and flowers of sulphur or a 5 per cent ointment of oil of white cedar (thuja) which you can obtain from a druggist.

Do Your Calves Have

A BRIGHT EYE and a SLEEK COAT?

Are they hungry at mealtime and are their bowels in a normal condition? If not, they are in danger of Indigestion, Scours and Calf Cholera, which if neglected is fatal. Dr. David Roberts

CALF CHOLERA REMEDY

prevents fermentation of food, liquifies the poisonous gases, has a soothing, healing antiseptic effect on the mucous membrane of the digestive organs and regulates the flow of gastric juice so that the calf's digestion becomes normal, the trouble disappears and the calf naturally recovers. For sale by dealers or postpaid $1.00. Ask for FREE copy of The Cattle Specialist and how to get the Practical Home Veterinarian without cost.

Make Cows Pick Up
—*give more milk*

FOR all-winter Milk profits, without interruption, most cows need more than simply good food. The sudden change from tender pasturage to dry, hard-to-digest feeds is too much for them to overcome—without aid. Part of the expensive diet simply GOES TO WASTE.

And this wasteful milk loss NOW! Take several of your poor milkers and give a tablespoonful of Kow-Kare with the feed—note the almost immediate improvement in the milk pail. It's those ADDED quarts that boost your milk profits. You'll be amazed at the convincing proof of the Kow-Kare aid to increased milk flow.

Kow-Kare has a direct, positive, action on the digestive and assimilating organs. It enables them to carry a heavy load without a break-down. It builds greater vigor into the cow while it is putting more milk into the pail. A single can of Kow-Kare will ration one cow one to two months, depending on the dosage you deem necessary. It's a small investment to pay for profit and health insurance.

Treating Cow Diseases

For Barrenness, Retained Afterbirth, Abortion, Bunches, Scours, Lost Appetite, etc., Kow-Kare is your one sure remedy. It attacks these diseases by quickly building up to robust health the organs where these troubles originate. If you have never tried Kow-Kare, ask your neighbor. Kow-Kare has a well earned reputation as a profit-maker and a money-saver in the cow barn.

For cows about to freshen, Kow-Kare provides just the strengthening aid needed to bring cow and calf through without costly disorders and loss of production. Feed it two to three weeks before and after calving; it costs little, brings sure results.

DAIRY ASSOCIATION CO., Inc., Lyndonville, Vermont

Makers of Kow-Kare, Bag Balm, Grange Garget Remedy, American Horse Tonic, etc.

Feed dealers, general stores, druggists have Kow-Kare—$1.25 and 65c sizes, (Six large cans, $6.25). Full directions on can. Mail orders sent postpaid if your dealer is not supplied. Our valuable free book on cow diseases sent free, on request.

KOW-KARE

FAMOUS CONDITIONER OF MILCH COWS

Wonder Healing Compound FOR MAN or BEAST

—It's CORONA WOOL FAT

Soothing Healing Ointment That Works Like Magic

Corona Wool Fat is made from the oil extracted from sheep's wool. It's different from any salve or ointment you ever tried. It heals and soothes, but will not smart or blister the most sensitive wound. It has healed thousands of stubborn wounds where other lotions have failed.

Hardly a day passes but what you'll find some use for Corona. For sore shoulders, sore necks, collar boils, split hoofs, scratches, sore teats on cows, caked udders, cuts, wounds, burns of any kind on man or beast it is unequalled.

LIBERAL SAMPLE FREE Corona is sold by nearly all druggists or direct from us on receipt of price—8 oz. tins 65c, 20 oz. tins $1.25, postpaid. If you will send your name and address, we'll mail you a liberal sample and book of uses Free. We want you to see for yourself the wonderful healing properties of Corona.

CORONA MFG. CO., 416 Corona Bldg., Kenton, O.

Cut Rates

A man stepped up to a grocer's cigar counter and bought two 10-cent cigars. A Scotchman who was waiting to be served pushed forward.

"You sell those cigars three for a quarter, don't you?" he asked.

"Yes," replied the grocer.

"Well," said the Scotchman, producing a nickel, "I'll take the other one."—The Progressive Grocer.

Ayrshires

—are a plain business proposition. "Profit" is always the biggest possible return from the least possible outlay. That is "AYRSHIRES" in a nut shell.

Let us give you the official figures covering Pinehurst Farm Ayrshires. They are of value to every one who farms to make money. Address

PINEHURST FARMS, Mr. J. S. Dunlop, Pinehurst, N. C.

Were you disappointed with the appearance of the last milk check? Perhaps you thought that after all the work and feed that had been put into the old herd a better looking check would be waiting for you.

A great many farmers are making sure of their milk checks by selecting Ayrshires — either grades or pure-breds. They have learned that the Ayrshire never disappoints.

Write for free booklets, or let us help you locate a herd

A 23-YEAR-OLD PRODUCER

LAURA

Laura, a pure-bred Jersey, is 23 years old and the mother of 19 heifers and 1 bull calf. In her twentieth year she made a record of 408 lbs. of butterfat. One Pennsylvania herd is made up entirely of her direct descendants.

Look to the Jersey for persistent, profitable production!

THE AMERICAN JERSEY CATTLE CLUB, Dept. B
324 West 23d St. - NEW YORK

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

The Kind of Care That An "Ordinary Farmer" Can Give

Under this condition the pure bred Guernsey cow, May's Emma, finished last year right by producing

8850 lbs. milk, 519.2 lbs. butterfat in ten months

She's a New York cow — started her record at two years old — carried a calf for 249 days of the record — was milked only twice daily — and on the last day she gave 22 lbs. of milk testing 6.5%. She is a typical Guernsey cow. For further information on the breed,

Ask for *"The Story of the Guernsey"*

Trailing Holsteins to South America

(Continued from page 61)

we were away at last. At last, at last. The long looked-for "at last."

About noon the captain spoke of running into trouble toward night as the glass was acting queer and that anything loose on deck should be looked after, or "made fast" as he put it. And right here I began to absorb nautical cant, for who ever heard of the expression "made fast" in Chillyville.

And sure enough. The prediction of the Old Sea Dog was right. For to quote the latest in slang aboard the Humming Bird, one should say: "He knew his vegetables." At dark the wind was fit to be tied, and by 10 p. m. the Humming Bird was lunging and plunging fearfully. Neptune was carousing, the sea was on a wild drunk, and spray and great showers rolled up her weather beam and spread over the deck like a fan.

Tonight I did not milk, it being too risky. Once when I was maneuvering to cross the deck with two pails of water, the Humming Bird dived with her nose into a crater of the sea and flung me into the scuppers. The upshot of it was that I quit carrying water. At dusk the sea was a wilderness completely corrugated with coulees and range behind range of silver mountain crests.

December 19. We nosed into a storm this afternoon off Cape Hatteras, and accompanied by a gale that was a humdinger. We had fire drill at 1 p. m. and had everything to make it a success but the fire. I was drafted and became a member of boat crew No. ———, well, I forget the number. But I know the way to the boat in case of fire, having a homing bird's instinct in that respect. Jimmie Wong and Jimmie Wing, Hong Kong, are appointees with me to furnish draught for one davit when lauching our lifeboat. Together they weigh 214 lbs. The davit is very rusty and pulls hard. I wish Wong and Wing would pull the same way. As things now stand, we have to scratch to swing our end clear.

[EDITOR'S NOTE:—This is the second of a series of six articles by Mr. Beattie. The next will appear in an early issue.]

BERT ANTHES, Fort Atkinson, Wisconsin

EAR TAG A—1132. Born July 2, 1926—A Show Bull Son of Prospector

Here is a Son of Prospector

Prospector, our junior sire, weighs 2850 pounds as a four-year-old. His calves are as like as peas in a pod, inheriting his color markings and great size. Prospector combines the blood of Carnation's two greatest cows, and transmits marvelous udders.

His son, pictured above, is from a 29-pound Homestead-Ormsby cow. Her average test for the year is 4%—and study the topline and depth of the bull himself.

If all the Dairy Cows In Iowa Were HOLSTEINS—

On January 1, 1926, there were 1,369,000 dairy cows in Iowa which produced approximately 6,200,000,000 pounds of milk last year at a feed cost of approximately $95,000,000. If all farmers were milking cows that were as productive on the average as the 811 cows (Holsteins) on Iowa state farms operated by the Iowa Board of Control, it would have only taken 617,600 cows to produce this 6,200,000,000 pounds of milk and if they had been as economically fed as the state cows, there would have been a saving of approximately $35,800,000 last year alone.

This statement was made by the Iowa State Secretary of Agriculture, Mr. Mark Thornburg, before the recent joint convention of the Iowa Creamery Buttermakers and the Creamery Managers and Secretaries Associations.

HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

Volume 72, No. 3 Fort Atkinson, Wisconsin February 10, 1927

JAMES E. KANE
Route 6, Dubuque, Iowa

MR. KANE is well known in his part of the country for his strawberries and grapes. Honey and chickens are other profitable products of his twenty acres. He has a fine big family of four boys and three girls, and this is what he says about the footwear they have for bad weather: "If I don't keep my feet dry I can't keep well, and all the boys and girls are like me in this, so when it comes to such things as rubbers, we buy the best. We always ask for Ball-Band and it's easy to tell that we are getting it, on account of the Red Ball trade mark. I have worn Ball-Band as long as I can remember, and I like it because I get good fit. I wear the four-buckle rubber arctic most of the time, with Ball-Band wool socks. The girls and Mrs. Kane wear cloth arctics and regular rubbers—all Ball-Band."

O. S. BUNDY
Proprietor Sugar Loaf View Farm, Winona, Minnesota

MR. BUNDY devotes his 250 acres principally to strawberries and red raspberries. At the height of the season he employs 125 workers, with an average of 15 men throughout the summer. He also plants 15 acres of asparagus of a quality that finds a ready market. Mr. Bundy is a Director of the Winona Milk Corporation. The whole Bundy family are wearers of Ball-Band footwear. The son has on Ball-Band leather top rubbers, his wife and his father are wearing Ball-Band boots. "I remember," said Russell Bundy, "the first pair of boots I ever had. I was eight years old and that little Red Ball on the shiny rubbers was a beautiful thing in my mind." His father interrupted: "Ball-Band in our family goes back to nearly twice your age," he said. "Your mother and I have not only bought Ball-Band rubber and woolen footwear for ourselves and children ever since we came to Winona forty years ago, but we have bought it from the same Ball-Band dealer. He wouldn't think of offering us anything else and we wouldn't think of buying any kind of rubbers that didn't have the Red Ball trade mark."

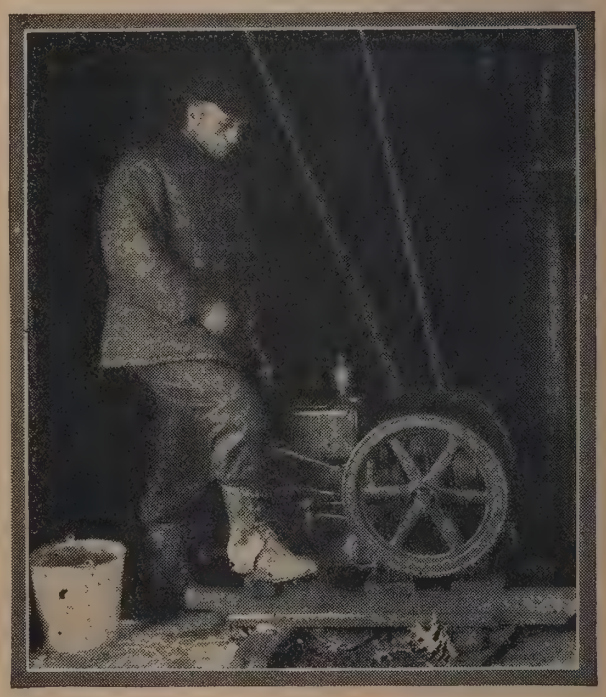
Outdoors in bad weather . . . but they keep their *feet* warm and dry

Read how they do it and what these farmers say about how to get *more days wear* in boots, arctics and all kinds of rubbers

MEN—and women—like those whose pictures are shown here, can go about their work in all sorts of bad weather, with perfect foot comfort. Their feet are always warm and dry, no matter how wet or cold it is under foot. That is because they wear Ball-Band boots, rubbers and arctics.

They enjoy foot comfort not only because Ball-Band footwear keeps out the wet and cold, but because their footwear *fits*. Every article with the Red Ball trade mark is shaped to fit the human foot.

And good fit results in more days wear. When your boots and rubbers last longer you spend less for footwear. Look for the Red Ball and be sure of getting *more days wear* for your money.



Whatever you need in rubber and woolen footwear, you can get it in the Ball-Band line. The stores where you trade no doubt have a wide variety of styles and sizes. If not, write for booklet and name of a nearby dealer who can supply you. Mishawaka Rubber & Woolen Mfg. Co., 313 Water St., Mishawaka, Indiana.

THEO E. MYERS
Manager Hayden Farm
Route 8, Ft. Wayne, Indiana

THE Hayden Farm is conspicuous among the farms around Fort Wayne for its many attractive buildings. Mr. Myers is a graduate of the Agricultural College of Purdue University, class of 1917. He didn't go to farming immediately after graduation, for Uncle Sam had a job for him until 1919. Since then, however, he has demonstrated how productive a farm can be made when brains are applied to it. He cultivates 160 acres and raises corn and oats for feeding some 60 hogs and around 650 head of sheep (Western feeders). "One of the things I learned at college," says Mr. Myers, "was the wearing qualities of Ball-Band footwear. Whenever there was rough work to do in bad weather everybody seemed to blossom forth with boots with the Red Ball trade mark. Here on the farm I wear the four-buckle rubber arctic mostly, with heavy dull sandals for going to town, and Ball-Band short boots for real wet weather and wet fields. I often marvel how any manufacturer can produce such a large line of rubber footwear of such remarkably uniform high quality."

ountry Saving as Well as Spending

Despite evidences on all hands of ːe spending, the American people ve been making a better record for ving than they are generally given edit for, as is indicated in the fol- ving statements from the National ty Bank of New York:

Sales of life insurance during 1926 ain broke all previous records, the :al for the eleven months through)vember approximating $10,117,- 0,000 or 6.6 per cent more than in e corresponding period of last year.

Three million more persons owned vings deposits at the close of the cal year 1926 than at the beginning, d there was an increase of $1,562,- 0,000 in the amount of funds on posit. At $211 per capita, total de- sit savings reached a new high cord for all time.

Christmas club savings funds broke e record last year, with total distri- tions of nearly $400,000,000, an in- ease of about 27 per cent over the stribution a year ago.

Building and loan association mem- rship increased from 9,886,997 to ,275,000, and total assets increased 70,000,000, or 14 per cent, to $6,- 0,000,000, a new high record.

The demand for investment securi- es has been extraordinary. The only niting factor on the bond business is been the inability of distributors supply the issues as fast as they e wanted. Above all, the amazing ing is the growing legion of indi- dual investors whose purchases are r cash.

Added to the thousands of investors ho have bought securities in the)en market are the large numbers ho are acquiring stock in the com- anies for which they work, usually nder some company aid plan. At ie close of the year more than 200,-)0 employes of the American Tele- hone & Telegraph Company were eported as contributing $2,500,000 onthly under one of these stock pur- ase plans. Approximately 60,000 nployе-shareholders of the United tates Steel Corporation are esti- ated to have profited to the extent $22,000,000 from that corporation's ecent dividend action, and there are any other similar examples where nployes by their contributions dur- g the past year and previous years ave earned the right to share in the rosperity of industry.

Yet on top of all this the American eople still had savings enough to ef- ect during the year a reduction of pproximately one billion dollars in ie national debt.

There can be no better measure of ie extravagance, or otherwise, of uying than the movement of prices. me need not fully endorse the pres- nt practices in regard to installment redit or minimize the importance f the production and credit prob- ems created by it, to point out nat despite all the attention giv- n to this form of financing, neither ie movement of bank loans nor of rices gives any evidence that the use f bank credit or the relation of pur- hasing power to production has been nduly affected thereby. Bank loans ave increased only moderately dur- g the year, while the downward rift of prices has already been com- ented upon. Here indeed is the es- ential difference between the pros- erity of 1926 and that of 1919—20. ix years ago we did have a great ver-expansion of buying, and its ymptoms were a large increase in ank credit and great upward surge f prices. None of these symptoms re present at the present time.

Now! More than 650,000 Cows Milked with De Laval Milkers

Proof of the overwhelming superiority of De Laval Milkers is shown in the rapidly increasing numbers which are being put to use by progressive dairymen everywhere. With more than 650,000 cows (including some of the highest producers in the world, and many owned by agricultural colleges, experiment stations, public institutions, producers of Certified, Special and Grade A milk) now milked with De Laval Milkers, the economy and efficiency of De Laval milking is firmly established.

Thousands of De Laval users say that it has made dairying more pleasant and profitable for them, that it milks their cows better and quicker than ever before, and produces more and cleaner milk.

If you are milking five or more cows by hand, a De Laval Milker will soon pay for itself. Your only regret will be that you didn't get one sooner. See your De Laval Agent or send coupon for full information.

Outfits for any size herd. Sold on easy terms.

Volume 72 FORT ATKINSON, WIS., FEBRUARY 10, 1927 Number 3

ELECTRICITY FOR THE FARMER

How It Brings Winter Eggs

E. R. MEACHAM, WISCONSIN

LIGHTS in the poultry house are giving the hen a twelve-hour day the year round. They let er eat more, drink more, and exer- ise more. She no longer uses up all f her feed for the extra warmth the old weather demands. Instead of aving to draw on her supply of ats she has a surplus for egg pro- uction. And winter eggs mean dou- led poultry profits.

Of course the flock must be prop- rly bred for production; the hous- ıg conditions must be right; and ıe general standards of poultry ıanagement must be observed before ; will pay to use light for this urpose.

"The hen is not overworked by aving a working day twelve or thir- een hours long," says Mr. H. L. Harver of the State College of Wash- ıgton in a recent publication. "She vas a native of the tropical regions vhere the length of the days and ights is nearly equal throughout the ear. Between three and four hours nly are required for her to digest er feed and very soon thereafter he is drawing on her store of fats. f her night is rendered shorter by neans of artificial light, much of her eed will go to the production of ggs, rather than to the building up nd absorbing of fats."

The discovery that the hen could e fooled into yielding her heaviest gg production when prices are high- st is of Yankee origin. It is be- ieved that to Dr. Waldorf, a Buffalo hysician, belongs the honor of first aving tried the experiment of light- ng his hen house to reproduce the ong working days of summer. This vas in December, 1889. But Dr. Waldorf was interested in scientific research and the commercial value of the increased production in his flock was not given publicity among poultry folks.

Nine years later a poultryman running a large Leghorn farm in New Jersey began using lights with his flocks.

In 1906 when Mr. Halpin, now of the University of Wisconsin, was an extension worker in Michigan, he tried the experiment of lighting his hen houses. He thought that he was originating the idea, but in his travels about the state he ran across a Michigan farmer who had been using lights to get winter eggs for years.

About the same time a back lot poultryman over in one of the suburbs of Liverpool attained marked success in getting winter eggs because he ran a grocery business in the city during the day and did not get home to feed his hens until around ten o'clock at night. He used to go directly to the poultry house, call the birds from the roosts by lantern light, and give them their evening meal.

This light is encouraging the production of winter eggs in the hen house on the Southern Wisconsin Company's Electric Farm, Wisconsin.

Mr. and Mrs. George Shoup fell upon the scheme of lighting their hens quite by accident. They have told the story of their discovery of the effectiveness of lights many times.

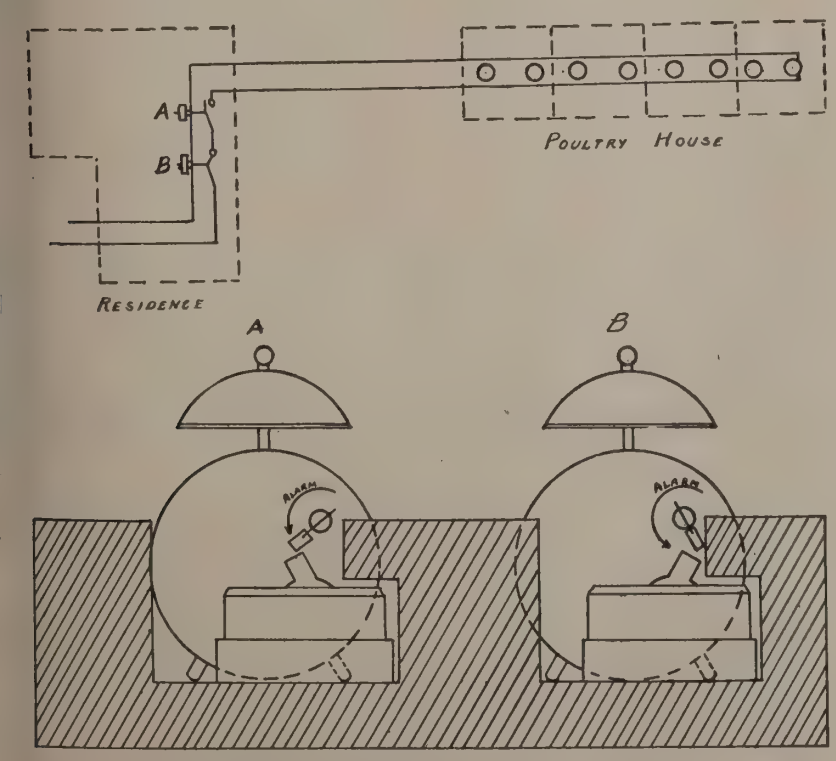
They were living in cut-over land out in Western Washington, faced with all of the problems of the pioneer. There was land to clear and shingle bolts and firewood to cut, besides the regular farm routine. In the fall of 1911, they had a flock of 300 pullets ready for production. They had made it a practice to do no work by daylight that could be managed by lantern light. Cleaning the dropping boards in the hen houses became a lantern light job that fall. Cleaning the dropping boards in the poultry house is as much a part of the daily routine with a well managed flock as cleaning the gutters of a dairy barn.

Soon they noticed that some of the pullets would fly down from the roosts to take advantage of the light and began to scratch about in the litter for kernels of grain that remained from the last night's feed. They even set the lanterns down, now and then, to watch the pullets scratch busily about, but they never left them long, for chores were always pushing them on.

An old English neighbor followed them through the coops one Sunday and laughing with them at the greedy hens gave them the hint that revolutionized their poultry practices.

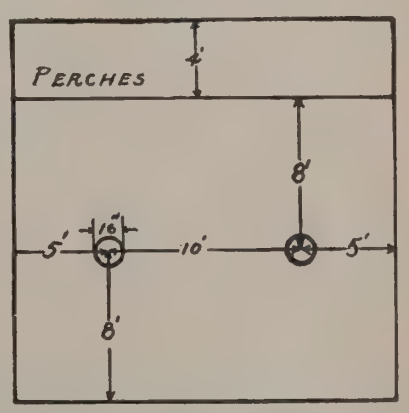
"Why don't you give the bloomin' 'ens lantern light to h'eat breakfast and supper by?" he asked.

They did at once—all the brightest lanterns they could buy.



"The birds were so evidently pleased with this arrangement that we could hear them singing long after dark, and in ten days from the purchase of the lanterns our production had gone up from 45 to 200 eggs a day," concludes Mr. Shoup in a letter to the editor of the Reliable Poultry Journal.

A few years later the Western Washington Experiment Station persuaded Mr. and Mrs. Shoup to come to Puyallup and give all of their time to investigating the whims and fancies of the hens.



That station has since made extensive studies in the problem of hen house lighting. The experiments have shown its practical value, and the station has made definite recommendations for its application.

One of the first concerns in planning the lighting of a pen is the avoidance of shadows. The hens will only work well when there is brilliant

Location of lights in a 30x30 foot house —suitable for 300 hens.

THE FEEDING OF DAIRY COWS

No. 8—Air, Water, Minerals, and Vitamins

If a Dairyman Could See Air; if He Would Believe That Milk Is 87 Per Cent Water; if He Knew That 1,000 Lbs. of Milk Contain 7 Lbs. of Mineral Substance; if He Could See Vitamins or Understand Their Functions, He Could Help His Good Cows to Do Better.

OWNERS of cows fifty or even twenty-five years ago were little concerned about air, water, mineral matter, and vitamins as factors in helping cows to return greater values for feeds consumed. A half century ago cows were fed mainly on pasture and dry roughage. The ration of the improved cow may include anything from chemically treated sawdust to sunflower silage, from cocoanut meal to cottonseed hulls, from potatoes to peanuts, from mangels to molasses, and from oat hulls to apple pomace, besides different combinations of the more commonly used feeds. Then cows were not closely housed for very long periods of the year; the modern cow is frequently housed from five to seven months of the year and some cows get no pasture at all.

Thus in man's effort to produce dairy products in the diverse sections of our country, in his effort to utilize diverse kinds of feed, in his effort to adjust production to seasonal demands, he has created a somewhat artificial environment for cows and thereby laid upon himself greater responsibilities in the feeding, housing, and general management of them.

The foregoing facts give us the reason for including a discussion of air, water, mineral matter, and vitamins in this series as factors that help cows to make better use of good rations.

What About Air?

Modern dairying requires that many cows be comfortably housed during the winter months. Comfortable housing implies plenty of pure air along with uniform temperature, dry beds, and clean quarters.

The chief function of air is, of course, to furnish oxygen for carrying on the life processes. As a result of the intake of oxygen and its use in the life processes, carbon dioxide, a poisonous gas, is exhaled as a by-product along with moisture, ammonia, marsh gas, and some other organic matter from the lungs. The problem is clearly one of supplying the right amount of oxygen and of removing the by-products to the extent that cows will have a normal air environment from which and in which to do their work.

Man has created a dairy cow that needs more air than her distant ancestors and in many sections he requires her to live indoors for several months of the year. What he does to supply her with a normal air environment depends, to no little extent, on how clearly he fixes in his mind's eye the movement of air from the atmosphere into the cow's body, its function, the movement of the by-products out of the cow's body into the atmosphere, and its effects if not removed.

When a dairyman builds a barn, he provides for the storage of roughage and concentrates; he provides a place in front of each cow from which the feed may be eaten; he provides a place for the daily collection of the manurial excrement and a carrier for removing it from the barn; he puts in a milking machine by which to remove the milk; and he puts in watering cups or provides a nearby place to drink.

When it comes to air, he too often takes for granted its supply and the removal of the by-products from its use in the cows' bodies. He can not see air; he does not feed it in a basket or remove the by-products with a fork or shovel. It is difficult for him to measure with his eye the effects that poor ventilation has on the production or health of his herd. About the only time he senses anything wrong is when the atmosphere in the barn has a foul odor or when moisture collects on the walls and ceiling.

A dairyman does not feed air by the basketful or use a fork or shovel to remove the poisonous by-products of its use in the cow's body, that are exhaled into the atmosphere of the barn. He cannot see air. He too often takes for granted that his cows are surrounded with the proper kind and amount of air from which and in which they do their work.

A dairy cow inhales about twice as many pounds of air in 24 hours as she takes in of feed and drink. To supply her with good air requires about 3,550 cubic feet per hour. A cow eating enough feed and water to supply the requirements for producing 33 lbs. of milk a day will exhale about 40 lbs. of moisture into the atmosphere of the barn in 24 hours. A herd of 15 such cows would exhale about 75 gallons of moisture. If the construction of the walls and ceiling is not right; if the ventilation is inadequate, some of this moisture will be collected on the walls and ceiling and the bedding will become damp and cold. In addition to this, the cows will be forced to breathe the impurities of exhaled air over and over again.

Space does not permit a discussion of how good ventilation may be obtained. We have sought to arouse more interest among dairymen in feeding air as well as roughage and concentrates and of removing the impure by-products of the use of air as well as the manurial by-products of the use of feed. We have pointed out why this is an essential part of getting greater values from the good rations one has learned to make and feed.

Milk is 87 Per Cent Water

It is easier to visualize the feeding of water to cows than the feeding of air. But even with this, the average dairyman does not fully realize the importance of supplying cows with water under conditions that will tempt them to drink all they need. He does not quite realize that heavy producing cows need proportionately much more water than other classes of live stock. He can not quite visualize that milk is 87 per cent water.

The quantity of water a cow needs daily depends largely on her size, production, and the character of her feed. The quantity she will actually consume depends somewhat on the conditions under which the water is offered.

The amount of water a cow needs depends mainly on her size, production, and on the character of her feed. The amount she will drink depends somewhat on how convenient it is for her to get water and on the character and temperature of the water after she gets to it. Anything that causes cows to drink less of water than they need is just as bad as cutting down on their feed.

Eckles reports observations on a Jersey cow producing 27 lbs. of milk daily and consuming 77 lbs. of water plus that in her feed. Another Jersey cow producing 13 lbs. of milk daily consumed 40 lbs. of water plus that in her feed. A Holstein cow averaging 110 lbs. of milk daily over a seven-day observation consumed from 215 to 350 lbs. of water daily plus that in the feed consumed. These same Jersey cows consumed 15 and 9 lbs. of water daily when dry.

One cannot see the mineral substance a dairy cow consumes in her feed nor the factors that are of greatest influence in helping her to convert these into body uses and milk production. He cannot see 70 lbs. of mineral substance in 10,000 lbs. of milk and yet it is there. If the ration is deficient in minerals he cannot see the cow deplete her body to make milk and yet this is what she does. If one could see these things, he would realize more fully the need of adequate mineral supply to dairy cows.

The individual drinking cup has made a good reputation among dairymen because it makes it convenient for cows to get good water whenever they want it. In many instances the drinking cup has proven that cows were not getting all the water they needed as shown by the increased production after the cups were installed. There is no mystery about drinking cups in supplying water to cows. They are merely a convenient way—a labor saving device—that does the job better than the average dairyman usually does it when watering cows from a tank.

Cows that are offered ice water even though several times a day will rarely drink all they need. It is no necessary to supply warm water i the winter. No one has determine if there is an ideal temperature fo water for cows. It is generally as sumed that cows will drink all the need of water ranging in temperatur somewhere between 50 degrees and 7 degrees Fahrenheit, if given oppor tunity to drink two to four times day.

Besides constituting 87 per cent o milk, water also plays an importan part in digestion, in the eliminatio of waste, and in the regulation o body temperature.

Mineral Requirements of Cows

The mineral requirements of dai ry cows are not fully understood o it might be better to say, the factor which govern the converting of mi eral substances of the feed into bod uses and all their functions are n well understood. It is comparativel a new subject and the positiv knowledge is limited. Some specula tive knowledge is in the process o being proved and the future alon can tell what new things science wi disclose. How much of mineral sub stances, which ones to feed, how an when to feed them are questions tha can not be fully answered. It is time ly, however, to point out the impor tant known facts and to sugges practices that will help to safeguar dairy herds from the known effect of mineral deficiency.

Of all the mineral elements foun in the cow's body and used for mak ing milk, it is thought the ones mos likely to be deficient in the ration ar calcium (lime), phosphorus, sodium chlorine, and in certain sections, io dine. It has been found that feedin rations extremely low in calcium an phosphorus results in the reproduc tion of dead calves or even abortion and the calves that are born alive ar frequently too weak to survive. I high producing cows it causes a weak ening of the cow's bones, a conditio known as osteoporosis. It causes reduction in milk flow. Sodium an chlorine are the components of com mon salt. An experiment by Bal cock and Carlyle of the Wisconsi Station shows that depriving cows o salt for extended periods of tim brought about a complete breakdow with marked loss of appetite, listles eyes, rough coats, and a very rapi decline in live weight and yield o milk. In certain sections the lack o iodine in feeds and water causes go ter in calves.

The foregoing facts are evidence that mineral substances are neede by dairy cows. The dairy farmer i interested in knowing what to d about it. He is concerned mainly wit what to feed, when to feed it, an how to feed it.

The chief source of calcium in farm grown feeds is in the legume hay The chief source of phosphorus is i the grains and their by-products suc as wheat bran, cottonseed meal, lin seed meal, and middlings. Salt sup plies sodium and chlorine. Iodine, i needed, may be obtained from potas sium iodide. The following feedin and management practice is recom mended to safeguard cows from th effects of mineral deficiency:

(1) Include a legume hay with th roughage; (2) balance the ratio with suitable concentrates; (3) fee roughage to the limit of appetite an concentrates according to productio as already given in a previous art cle; (4) provide salt; (5) give cow from 6 to 8 weeks rest or dry perio

Vitamins, like electricity, are known more because of their effects than from their composition. Their function seems to be to promote growth, health, reproduction of young, and production of milk. Good rations and proper cow management are thought to supply sufficient vitamins and in most cases give them proper conditions for doing their work.

BROWN SWISS CATTLE IN THE UNITED STATES

THE original home of the Brown Swiss breed is in witzerland where it s been developed dur- g many centuries. It probably one of the dest breeds in exist- ce, and it is thought at no outside blood has en introduced since cords began.

nportation and Distribution

The first importation Brown Swiss into the nited States was made Massachusetts in 1869 id another in 1882. A mber of importations ve been made since, it only in small num- rs. After 1906 there ere only a few impor- tions because of regu- tions due to the prev- ence of foot and outh disease in Europe. here are in the United ates about 8,000 regis- red animals, and about 2,000 grades carrying ore or less Brown wiss blood. These are be found scattered in 25 states, e largest numbers being in Wisconsin, Illinois, New York, Minnesota, ichigan, Iowa, Pennsylvania, and hio. Of late years the breed has ade notable increase in popularity.

General Characteristics

The large frame of the Brown wiss cattle indicates that they have een developed for service as draft nimals as well as for milk. They are ubstantial in appearance, well pro- portioned, with the body well covered ith flesh. The calves weigh from 65 90 lbs. at birth. The heifers are ow in maturing. When full grown e cows weigh from 1,100 to 1,600 s., averaging about 1,250 lbs.; and e bulls range in weight from 1,500 to ,200 lbs., averaging about 1,750 lbs.

The color of the Brown Swiss aries from dark to light brown, and t some seasons of the year ap- roaches gray. There is usually a ght stripe of gray along the back. White splashes near the udder are ound on some animals, but white plashes on the sides of the body or n the back are objectionable. The air between the horns is usually a ighter shade than the body. The ose, switch, tongue, and horn tips re always black, and there is usually light or mealy ring around the muzzle.

Production

Brown Swiss produce milk with an verage butterfat test of just about 4 per cent. The 490 cows which have finished records up to July 1, 1926, have an average production of 12,634.5 lbs. milk, 505.42 lbs. fat per cow. The ten highest milk producers and butterfat producers for the breed are listed below:

REUBEN, LEADING BROWN SWISS ADVANCED REGISTRY SIRE WITH 24 A. R. DAUGHTERS

Ten Highest Butterfat Producers

	Milk lbs.	Fat lbs.

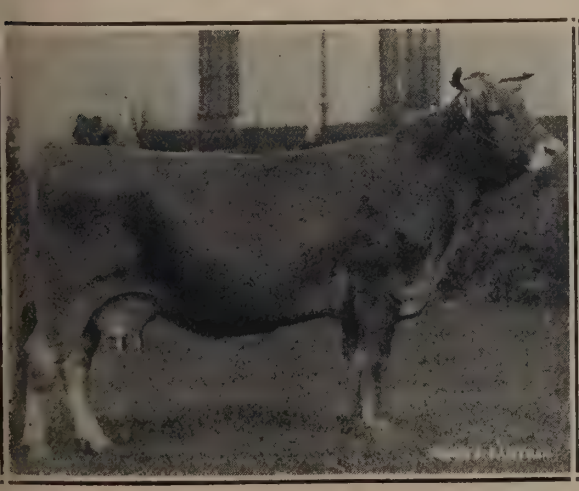
Bulls

The ten Brown Swiss sires having the highest number of tested daughters are listed below in the following table:

	No. of A. R. daughters
Reuben	24
Vogel's College Boy	11
Collier	10
Junker	10
College Master	10
Tom Phylis	9
Swiss Valley Reuben	8
Casper C.	7
Ben Hanson	7
Sunny Hill Bob	7

The office of the Brown Swiss Cattle Breeders' Association is located at Beloit, Wisconsin.

(Editor's Note: This is the third of a series of six articles on the dairy breeds in the United States. The next will appear in an early issue.)



Scale of Points for Brown Swiss Females

	No. of points
Head, medium size and rather long	2
Face, dished, narrow between horns and wide between eyes	2
Ears, large, fringed inside with light colored hair, skin inside of ear a deep orange color	2
Nose, black, large and square with mouth surrounded by mealy colored band, tongue black	2
Eyes, moderately large, full and bright	2
Horns, short, regularly set with black tips	2
Neck, straight, throat clean, neatly joined to head, shoulders of good length, moderately thin at the wether	4
Chest, low, deep and full between and back of fore legs	6
Back, level to setting of tail and broad across the loin	6
Ribs, long and broad, wide apart and well sprung with thin arching flanks	3
Abdomen, large and deep	5
Hips, wide apart, rump long and broad	4
Thighs, wide, quarters not thin	4
Legs, short and straight with good hoofs	2
Tail, slender, well set on, with good switch	2
Hide, of medium thickness, mellow and elastic	3
Color—shades from dark to light brown, at some seasons of the year grey; white splashes near udder not objectionable, light stripe along back. White splashes on body or sides objectionable. Hair between horns usually lighter than body	4
Fore udder, wide, deep, well rounded but not pendulous nor fleshy, extending far forward on abdomen	12
Rear udder, wide, deep, but not pendulous, nor fleshy, extending well up behind	12
Teats, rather large, set well apart and hanging straight	8
Milk veins, large, long, tortuous, elastic, and entering good wells	6
Disposition, quiet	2
Size, evidence of constitution, and stamina	5
	100

What I Am Trying To Do On My Farm

To Solve My Marketing Problem

W. J. DOUGAN, WISCONSIN

I DO not want to pose as an expert on the great problem of marketing farm products. This subject is engaging some of the brightest minds and shrewdest business experts, still they are baffled and far from a comprehensive solution of this problem. There are a few facts bearing on this subject that have become manifest to me in my experiences in trying to dispose of my products at a fair profit.

If one is to market a product he must have a standard quality in sufficient quantity to meet the demand. It must be easily available to the consumer and he must let the consumer know regarding the product. Thus marketing reaches back to production; includes distribution and advertising.

Soon after I had started my dairy business, Dean Henry gave me this trite counsel: "Dougan, keep right on producing the quality and let the people know what you are doing." Whatever success I have had in marketing is due to conformity to these principles. When I went onto the farm I had a definite purpose, viz., to produce and distribute to the people of Beloit the best milk to be had anywhere and to get a price for it that would enable me to live in conformity with standards of the community. Through the years of development, this purpose has remained constant. The development of the business was gradual both in the improving and standardizing of the quality and the increase in business and the increase in price.

In quality I was a law unto myself. I fixed my ideals of a good milk and used the knowledge of the University in developing and testing my product, then practiced and still practice eternal vigilance to keep the quality up to standard. One of my greatest difficulties has been to always have the milk to meet the demand. The business has had to produce its own capital. At one time when I was getting four or five cents above the usual price, another milkman wanted to know, "Where in h—— I found people who would give ten cents per quart for milk." I told him, "I didn't, I found them in Beloit," and I will tell you I found them by advertising. I have used various means of advertising—newspaper ads, circular letters, store window displays, floats in business parades, demonstrations at fairs, etc. Through all my advertising is a fixed purpose. I never beg nor never ask for customers. I never hit the other dealers. I never advertise a cut price sale but I aim to give information of how my milk is produced, its great value as food, and its extreme value in saving the babies. I aim to keep my name and methods so completely before the people of our town that if a stranger should ask any man, woman, or child, "Who produces the best milk in Beloit," they would answer without hesitation, "Why, Dougan, of course."

Perhaps the uppermost question in your minds is the same as my fellow dairyman asked years ago, "How am I able to get people to pay 20c per quart for milk during the past five years? The question is partly answered in the foregoing, "I am producing a quality product that is needed in my town."

In 1921, I was close pressed because prices in every farm product were falling. However, my cost of production was increasing. Moreover, I had been running on too close a margin during the war. I could not reduce price, keep up quality, and remain in business.

I took into counsel some of the business men and the doctors. They invariably advised me not to quit or reduce quality. The doctors said, "Beloit needs your product." I give this incident to show how I play above board. I have sought the confidence of the public. Another factor in holding this confidence is, I play no favorite. I have one price for all.

The poorest family in town which sacrifices to get its quart of milk for a sick or young babe gets the same quality of milk and the same service as do the wealthy.

Another reason for my control of price is that I give full value for price received. One lady expressed it this way when I informed her that the price had gone up, "All right," she said, "it is worth it," and pointing to two youngsters remarked, "We consider it a good investment."

What I have worked out in marketing in my little business can and must be done by organized and united farmers in all farm products.

THESE FLOATS APPEARED IN THE PARADE FOR THE FOURTH OF JULY CELEBRATION AND REPRESENTED MR. DOUGAN'S HERD, THE PRODUCTION OF MILK ON HIS FARM, AND HOW HE HANDLES THE MILK IN THE MILK ROOM

Wisconsin's Earliest Cow Tester

GUY A. PETERSON, WISCONSIN

FOR more than 20 years now H. C. Searles, fieldman for the Wisconsin Dairymen's Association, has been connected with the program of improving dairy cows in the Badger State. Today, Wisconsin, with about 175 active associations, leads the nation in this type of co-operative endeavor. No small amount of this credit must go to the veteran fieldman from Fond du Lac. He organized the first Wisconsin cow testing association in 1906 and was its first tester, and since he has had experience with some of the most vital testing problems perhaps it would be well to relate some of these experiences.

Began Work in 1905

Searles started work with the Wisconsin Dairymen's Association on Aug. 1, 1905. He was appointed as an instructor in butter and cheese making, but his chief activities were limited to visiting factories and aiding in the improvement of the quality of dairy products. The work covered was practically the same as that done by the Dairy & Food Commission, so Ex-Governor Hoard made the suggestion that the association should be working at the source of the dairy business, the dairy cow, and something should be done to improve the quality of the stock.

Acting upon this suggestion the Wisconsin Dairymen's Association advertised that it would carry on testing work for a year in some part of the state to ascertain about what per cent of the cows were unprofitable. It was agreed that the work was to be done free of charge to the farmers who joined and H. C. Searles was delegated to the task. Math Michels, who was then located at Cream City, invited the association to send a man to test and keep records of the herds delivering milk to his creamery and Chas. Hill asked that herds in the vicinity of Rosendale and Eldorado be allowed to enter.

Three Organization Meetings Held

"We held organization meetings at these three places," says Searles, "and accepted those who volunteered to allow records to be kept on their herds. The following men entered their herds in that pioneer association: Walter Vienyon, John Edwards, Will Hoyt, Warren Hoyt, Wm. Averbeck, Levi Bronson, from Rosendale; Ed. Beyer, Herman Olem, Math Michels, Frank Berg, Henry Berg, John Bast, Herman Rupp, and John Simmons from Malone; Ed Berg, Wm. Schusman, and Wm. Schley, from Cream City; Wm. Bock, Henry Yockey, and Frank Rather from Calumetville; Fred Abbs, Leroy Duel, and Dennis O'Hearn from Eldorado; and Antone Moersch and Wm. Rather from Pueblo.

"I began testing in the spring of 1906 and kept a record of these 26 herds for one year, and Arthur Henning of Eldorado tested them in 1907. There were about 400 cows in the association but we found that about 100 of them were not worth feeding.

Try Canadian Plan

"In 1907 I started to organize cow testing associations on the Canadian plan of allowing the farmers to take their own samples and deliver them to a central point, usually a creamery or cheese factory. The price for this form of testing would vary from 25 to 50 cents per cow per year. We had a great deal of faith that our farmers would carry on such important work for the full year without the aid of a

TRAILING HOLSTEINS TO SOUTH AMERICA

The Log of Their Keeper

JAMES G. BEATTIE, WISCONSIN

DECEMBER 20. Everything is progressing today, even the Humming Bird. She is skirting the Gulf Stream to dodge the current, and by so doing makes 8.4 miles per hour. The temperature has

THE BOATSWAIN WITH A DOLPHIN CAUGHT WHEN TROLLING IN THE WEST INDIES

jumped to 76 degrees now. Everybody is peeling off the sheepskins and heavy underwear. The skipper watched me take the blankets off the cattle today. He calls them, in his naive way, rugs.

December 21. Summer raiment now, and all the rugs are shifted. We are in latitude 26 N., temperature 82, and somewhere out from Miami. This morning an oiler, trolling, caught a dolphin, which is considered quite a feat. It weighed 14 lbs., and not a few gathered around and watched it change colors while dying; several, in the meantime, narrating instances of catches where the present unfortunate fish was a mere stripling, which, of course, is human natural. And it worked out as it invariably does, the fellow who waited till the last was the fellow who caught the biggest dolphin.

December 22. Latitude, 22 N. Like fresh yeast the temperature is rising, being temporarily at 88 degrees. The weather is getting very pleasant and warm; in the latter respect it could be accused of being too impetuous. Last night the third mate pointed out a lighthouse on San Salvador, the place where Columbus made his first landing.

December 23. Saw galloping fish in Milwaukee one time, but not until this morning had I ever seen them flying. In leisure moments I watch them over the bulwarks. Sometimes the bow scares them out of the water and sometimes hostile fish. They receive their momentum to fly or volplane along by a spirited rush upward from the depths, their wings coming into play then and carrying them along for perhaps fifty yards, more or less. This morning two were so unfortunate as to light on the deck and fall into the hands of hungry Spanish firemen, who dressed them in a hurry.

At sundown we are entering the Windward Passage, the natural shortcut for shipping between North Atlantic ports and the canal. Haiti and her blue ridges loom to port, while Cuba and her purple peaks rise out of the haze to starboard.

December 25. Well, this is Christmas without trees or snow, and we are crossing not the Bar but the Caribbean, with our progress impeded only by a rough sea. The sailor-quartermaster has the Humming Bird's beak trained on the breakwater gate of Colon, which is a matter of only 75 or 80 miles over the horizon. The sea strikes on the port bow so that from it we derive a sort of double pitch, a lunge with a roll resembling the tilting of a skillet when you run something round and round in it. The cattle are having excruciating times, as one minute their heads are 30 degrees up and the next minute it is their sterns, and so on. But they have a weary patience about them that one cannot help but admire.

We had an old gobler for dinner that was something of an enigma for those having false sets, and all during the meal the defenseless bird was the subject of much and varied comment.

December 26. For awhile last night we had a lively time on the after well-deck. The sea got to acting up and began coming over the bulwarks in such dimensions and mass formations that the skipper almost, but not quite, changed the course. He disliked doing it because it would result in a loss of time and this "time" proposition at sea is (and again is not) an eternal nuisance. But the height of the billows diminished abruptly after being at their peak, probably because we passed the center of the storm's path, and from then on, through the last hours of night, they did not threaten again.

The lights of Colon were visible on the sea rim at 3 p. m., two hours before we took refuge behind the breakwater from the rampageous Gulf waves. Palm trees and tropical vegetation were very much in evidence, and green grass. General's dreamy eyes spied the shore line, in fact all detected the delicious fragrance with their nostrils, and such lowing and begging for a gambol has gone on here this forenoon as is seldom heard.

AT THE PACIFIC ENTRANCE OF THE PANAMA CANAL

The port doctor came out in a launch and examined us, and after that there was something to do or look at every minute. The ship went alongside and took bunkers, water, some supplies, and a pilot with crew to take us through the canal; and while thus engaged, some bananas and oranges were dickered for in a private way.

At 9 a. m. we started through, passing from one lock to another under our own steam and held in position at all times by electric "steel mules" that kept apace on either side the ship. At 12 noon we were in Lake Gatun, past three locks—halfway. You know, I always thought the canal ran east and west, and I wouldn't doubt that there are some more around Chillyville that think the same. But that idea is wrong, absolutely. The direction is about parallel with the general course of the Missouri river, northwest and southeast, the Atlantic entrance being on the northwest side. The three locks on the Atlantic side elevate the ship 88 feet, then you steam through artificial Lake Gatun—24 miles, and descend in three steps to the level of the Pacific.

There is lots of interesting history connected with Panama and the digging of the canal. For instance, it was the French that started it and not the States. It was malaria and fever that put them out of business, then it was the States whipping the mosquitoes that made the canal a "go." There are enough dead Frenchmen laid head to foot and foot to head to reach as far inland as they went. This I relate as I heard it, without guarantee.

At 5 p. m. we are through, and passing out to the great Pacific. Warm from the skipper's lips comes this nicely weighed comment: "A fine big ocean this." As we passed Balboa and Panama City, the sea rose up to meet us like a beautiful painting, calm, glassy smooth, and nothing to disturb it except now and then a pelican or gull or some other water fowl languishing in the composure of night.

December 27. Sunday is the same at sea as other days; only this morning there was a little variation in the routine when a fight took place between some spic firemen and an engineer. Not being around at the time I saw neither the first nor the last round. But I heard all about it, for news travels on a ship just the same as it does anywhere. The former had knives and the latter a monkey wrench. The deciding round is pending, so with that kind of boxing gloves I suppose it will be the fellow who gets in the first crack.

At 4 p. m. some mountain range looms vaguely through the haze to port. And at twilight a flock of sea swallows were following close after the Humming Bird. The sailors call them Mother Cary's chickens and every time a sailor dies, so they say, his spirit turns into one.

December 28. Buenaventura, Colombia, our first stop with cargo, is situated on an estuary of the sea—25 miles back from the ocean. There is a dangerous bar at the entrance and high tide is necessary for a ship of 8,000 tons to pass. We arrived this morning when the tide was low, so that waiting outside until after dinner or for the flood was necessary. We proceeded cautiously at half-steam ahead, continually taking

(Continued on page 155)

DAMAGED CATTLE SHEDS

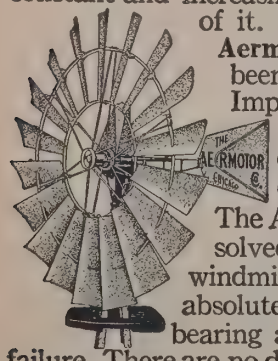
This damage was done by freight from the slings used to bring the cargo out of the hold. It would have been better to have built the cattle sheds at either end of the ship, rather than directly opposite each other.

IN THE PANAMA CANAL

The cattle sheds are shown in the foreground on either side of the aftermast. The narrow opening in the rear shows the gates of the lock nearly closed after the Humming Bird had entered. One of the six steel mules that hold the ship in place so it will not damage the lock, is shown at the top of the wall at the left.

Batteries that give instant starting in the coldest weather

WITH battery ignition on your engine, and with Eveready Columbia Dry Batteries to feed an intense, fat spark to the cylinders, you can laugh at the harshest weather that winter can bring.



No matter if the engine lies idle for days. There'll be no ignition troubles. For as soon as you turn it over, the Eveready Columbias will start shooting sparks across the spark gap hot enough to fire the coldest mixture. These batteries are always on the job.

–they last longer

A WONDERFUL SUCCESS

"Nothing succeeds like success," they say, but where success is constant and increasing there must be some unusual merit back of it. The continued success of the **Auto-Oiled Aermotor** is based entirely on merit. It has been made better and better year after year. Improvements have been added as experience has shown the way. The **Auto-Oiled Aermotor** of today is a wonderfully durable and efficient windmill.

The Aermotor Company, more than 12 years ago, solved the problem of complete self-oiling for windmills in such a way as to make the system absolutely reliable. The oil circulates to every bearing and returns to the reservoir with never a failure. There are no delicate parts to get out of order. The double gears run in oil in a tightly enclosed gear case.

Butter Substitute Referendums

A. WENDELL BRACKETT, WASHINGTON

WILL the general public ever approve of a bill prohibiting or taxing the sale of butter substitutes? Can the public ever be convinced that the dairy industry is worth protecting? These are the questions many dairymen are asking themselves since the failure of referendum bills in regard to the sale of butter substitutes in California last November and in Washington and Oregon in 1924.

Some of the advertisements used by the Grays Harbor dairymen to create favorable sentiment for the butter bill. They sought to tie up the interest of the city with the interest of the farmer.

The real question dairymen should ask themselves is, "When will we, the dairymen, wake up to our problem and actually get to work to sell the dairy idea to the public?" Why blame the public, when we have never properly presented our side to them?

There is plenty of evidence that such bills can be carried when dairymen actually get down to work. The public is generally fair when it has all the facts. Those communities which properly presented the facts made a remarkable showing. The story of one county in Washington in 1924 should be of general interest to all dairymen.

According to the 1920 census, Grays Harbor County in the state of Washington had 5,447 cows and 44,745 people, or about one cow to 7.8 people. The rate for the state in the 1920 census is one cow to 5.7 people. In the "cow counties" it is one cow to 3.3 400 to 4,000. These towns had 78% of all the votes in the county.

On the final vote 57.2% of the total of 13,075 votes were cast for Referendum No. 16 Pure Butter Bill, while for the state only 45.5 per cent of the 372,063 votes were cast for Referendum No. 16. One dairy county with more than two times as many cows and 11,940 less people lost the referendum by 820 votes. The referendum was carried in the city of Aberdeen by a vote of 2,454 for and 2,173 against. The total for the county was 7,475 for with 5,600 against, a margin of 1,875 on the "for" side.

Six cow counties with less than half as many people per cow did not give this percentage of votes. Here is ample proof that if dairymen in other counties had worked as hard as did the dairymen in Grays Harbor County the bill would have carried. Grays Harbor dairymen realized that they had a fight that they could not expect the Central State Committee to win for them, so they set about to win for

themselves. How did they do it? Here are the steps briefly:

First: The dairy association contributed their share to the state campaign fund. For the local campaign the county agricultural council appointed a general committee, a finance committee, and a publicity committee.

Second: Finances were raised by farm to farm visits by dairymen, 50c per cow, two solicitors to each district.

Third: Two men to the district saw that all rural voters were registered.

Fourth: One month before election, quarter page advertisements were started in the weekly papers. Stories were sent with each advertisement. Two weeks before election, quarter page advertisements were started in the daily papers with news articles on the campaign. These advertisements were increased in size and number until full page advertisements were run in the daily papers three days before election. At the bottom of each advertisement was run this statement: This advertisement paid for by 275 farmers and business men of Grays Harbor County." Advertisements were also run in motion picture theaters.

Fifth: Local farmers went before each Chamber of Commerce, Kiwanis, Rotary, and active clubs to explain the bill. A delegation of farmers visited bankers and leading business men, loggers, and lumbermen, asking them to sign a petition urging the Tacoma Chamber of Commerce to ask the Seattle Chamber of Commerce to endorse the bill. Only one man refused to sign this petition. Granges devoted one whole program to the bill.

Sixth: Posters were placed on cars, in stores and banks. Farmers and business men wore buttons with "Vote for Ref. No. 16." A parade was staged at the county fair.

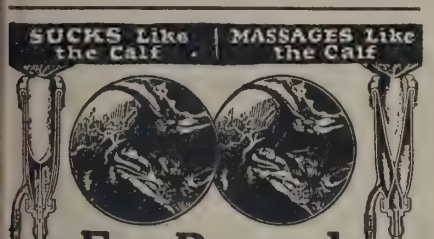
Seventh: At the final windup each community provided a certain number of farmers to stand at each voting place and pass out slips reminding the voter of his duty. Over sixty of these farm men and women stood in the heavy rains and passed out these slips until relieved at four o'clock by boys hired for the purpose.

The money was budgeted. Over 80 per cent was contributed by farmers. Every debt was paid promptly with a balance in the treasury at the end of the campaign.

The general chairman was a poultryman, Clarence Glenn. To show their appreciation of his services, the dairymen gave him a gold watch and chain after the campaign. Every dairyman put his shoulder to the wheel. Not a single dairyman refused to work when asked.

After all, Washington as a whole made a good fight, carrying 29 out of 39 counties. The final vote was 169,047 "for" and 203,016 "against." Thus the referendum was lost by 33,969 votes. Had 17,000 of these voters been won over to the "for" side, the bill would have carried. The results in this one county and a few others, notably Skagit and Whatcom, showed this could have been done.

If such counties as Grays Harbor, with heavier odds against them than either the whole state of Washington, the whole state of Oregon, or the whole state of California, can win by such a large margin, why cannot all counties in these states do the same? They can when dairymen properly appraise the task before them and actually get down to brass tacks to win.



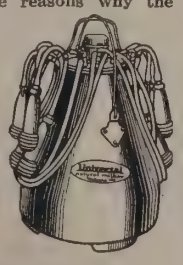
Christened With Milk

While a shivering throng looked on, the giant steel carferry, Madison, the first ship ever christened with milk, was launched at the Manitowoc Shipbuilding corporation's yards on January 19. The vessel, one of the largest of its kind on the great lakes, will be put into service by the Grand Trunk Railway, owned by the Canadian government, on its Milwaukee—Grand Haven route.

When the Milwaukee Association of Commerce heard that a sister ship to the recently launched Grand Rapids was to be built at Manitowoc, it prevailed upon officials of the shipyards and the Grand Trunk to consent to baptizing the boat with the state's premier product. Moreover, the ship was named in honor of the state's capital city.

Following the launching, a luncheon was held at the Manitowoc Elks' club. John LeFeber, president of the Gridley Dairy Company, announced that the fluid used to christen the ship was representative of the state's entire dairy industry, having been composed of milk taken from five breeds of cows.

The "Madison" will carry thirty of the largest type of freight cars and is also suitably arranged to carry first class passengers and automobiles. There are private staterooms and suites, a private dining room for passengers, and a large observation room with lounging chairs and writing desks. The staterooms, main saloon, dining saloon, and crew's quarters are finished throughout with the latest design of hardwood finish. The floors in the saloon and staterooms are in hard block rubber to match up with the interior finish.—Milwaukee Sentinel.

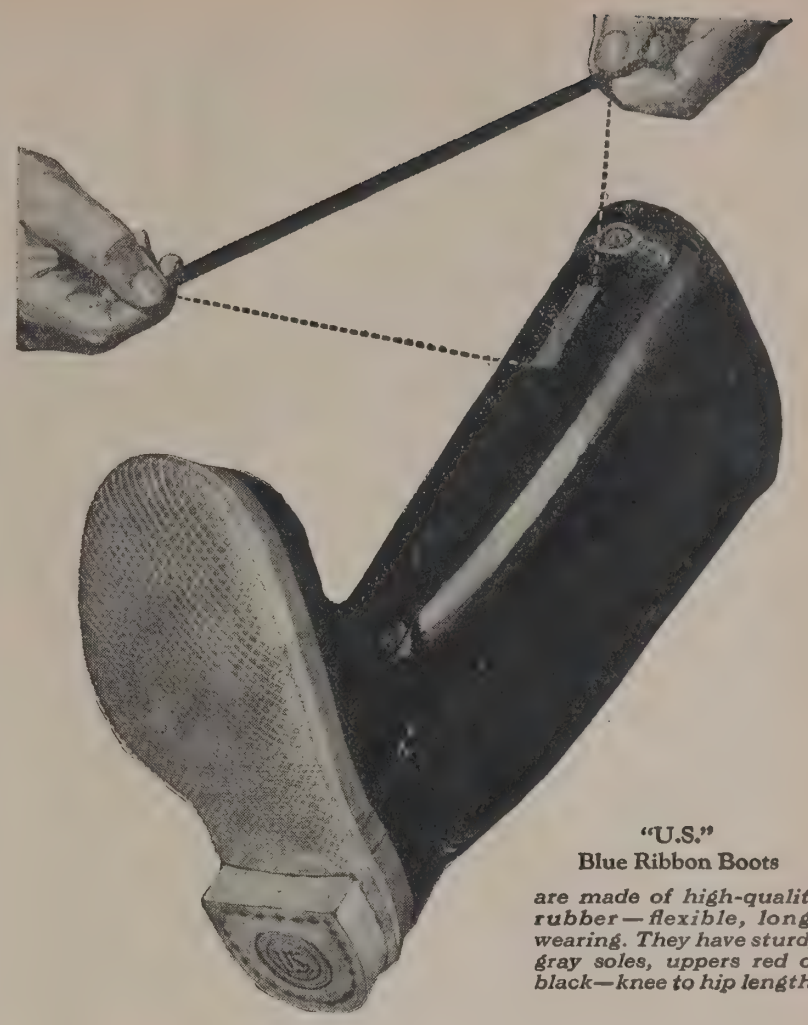


Far Beyond Experiment

The purchase of a Universal Milking Machine is an investment in a highly perfected and practical milker. The fact that over 30,000 are now in use and giving genuine satisfaction is ample proof of that.

For the owner of a herd of 10 or more cows, a Universal Milking Machine is a necessity. More and cleaner milk results from its use. Farm hands are more contented and more interested in their work. Labor costs are reduced—milk production is increased.

Such features as *low vacuum* (12 inches), *perfect teat cup, sanitary check valve, conical inflation* and *alternating action* are reasons why the Universal Milking Machine is preferred over all others.



Write for descriptive catalog, one of the most complete and educational books ever published on milking machines.

Milk an Antidote for Lead Poisoning

TAKE on nobody for work in this factory who is over 45 years old." Think of the pathos, think of the tragedy, in that statement. All through at forty-five! Impossible, you say; why, a fellow is still young at forty-five.

And yet, it's only too true. That order, or one similar to it, is issued in a number of factories in the experience of Dr. C. P. McCord, Cincinnati industrial physician, who recently made some far reaching revelations in his talk before the National Dairy Council at their annual meeting.

"We ordinarily think of the American workman as being sturdy, well-muscled, and ruddy," says the doctor. "To the contrary, many times he is a very low physical specimen, a poor human machine illy adapted to his work." Bang! Right off he knocks an established idea into a cocked hat.

He continues: "Here's a thing I see fairly frequently—a room where 20 workmen are employed, mostly Kentucky hill men. They handle molten metal, galvanizing. On one side of the room are acid vats from which steam is rising. Over here is a row of vats containing molten metal giving off fumes.

"Go into the room. What do you see? The men look as though they are hardly able to work. Most of them are under weight, most of them show signs of fatigue. They look sick. They have their whole bodies bathed in an acid atmosphere. While their skin is not hurt so much, their teeth are eroded, gums inflamed, and they develop bad mouth conditions. Gastritis follows, and in some instances, ulcers. They can eat only two or three foods.

"I went down to the home of one of these men. I wanted to see what he would have for dinner. He did not know I was coming. The situation was pathetic. The home was pathetic. For his night meal he had nothing but blackberry jam and cornbread. He told me that during the blackberry season he could get along fairly comfortably on these."

Lead poisoning—what does it look like, how does it act? Dr. McCord describes a typical case: "A man comes in telling me he is a lead worker and cannot eat. It usually starts with inability to eat breakfast. Shortly he will tell me he has a queer taste as though he had a penny in his mouth. Then comes a headache, and constipation becomes very severe.

"He begins to get weak in the muscles he uses most, usually the right hand. When he goes to shake hands he has no grip. He can no longer work because he can't pick up the tools. He is pale, anaemic, his blood is being destroyed. These are minor symptoms.

"Then comes the severe pain. Lead colic is about as severe a pain as I know anything about. Many times a man loses from work one month, six weeks, two months, or even three months because of lead poisoning."

There are more than 200 industries in which this lead hazard occurs. Linotype operators, electrotypers, artificial flower makers, battery manufacturers, white lead manufacturers are but a few examples. About three-quarters of a million of our industrial workers are exposed to lead poisoning, according to Dr. McCord. He reports one man who had lead poisoning seven times in a year and a half.

Is there a remedy? Isn't there something that can be given these factory workers to prevent this suffering? What is the antidote?

Dr. McCord gives the answer to all these vital questions with one word—milk.

"For a long time a few people have kept telling us doctors that if you drink a little sweet milk when you work with lead you won't have lead poisoning. I have pooh-poohed that, and now I am apologizing. We have found very acceptable evidences that lead poisoning is controlled by milk.

"I have had a small group under observation now for three years. The first year lead poisoning was very high. Then it was arranged that the management made available every day a quart of milk for every person who wanted it, and they were encouraged to drink it. For a period of about two years we had practically no lead poisoning.

"Why is milk valuable? Why am I anxious that all lead workers be given milk? Because milk contains a considerable quantity of calcium which helps in throwing the lead out of the blood—where it is most troublesome—and depositing it in the bones of the body."

"Every other form of protection in the way of wet processes for keeping down dust and of promoting general cleanliness to keep lead out of the body is essential. But if, in addition to those things, *milk* is given, at least 75 per cent of lead poisoning will disappear.

"Every morning a milk wagon drives up to my house and leaves an adequate supply of milk. I know that same thing is going on at my neighbors'. Later in the day a milk

Get More Trips from your Milk Bottles

Use the Milk Bottle Scientifically Constructed to Resist Breakage

That's the Thatcher Superior Quality Milk Bottle. Thatcher Bottles always have been the best made. Now they are better than ever. Recent improvements in our methods of manufacture and the addition of new equipment enable us to put out a bottle scientifically designed and constructed to outwear any milk bottle ever made.

Made only of the purest flint glass, perfectly tempered in lehrs used by Thatcher exclusively, Thatcher Bottles are stronger, tougher and more uniform in quality than any other milk bottle made. Thatcher Bottles give "more trips per bottle." Actual experience of dairymen and exhaustive laboratory tests have definitely proved that Thatcher Superior Quality Milk Bottles actually wear longer and are harder to break than any milk bottle on the market. Our Trade Mark is blown on every Thatcher Bottle for your guarantee and protection.

Posters for tying up with Thatcher's National Advertising are supplied free to users of Thatcher Bottles. Several Thatcher factories assure prompt deliveries. Write today for samples and prices of Thatcher Bottles.

Superior Quality Milk Bottles

wagon drives up to the schoolhouse in my community and leaves a supply of milk.

"I do not, however, know of or see this milk wagon or any other milk wagon drive up to the receiving department of factories and leave there an adequate supply of milk for the workers. This is true, notwithstanding the fact that nutritional problems are very prevalent in industries, that death rates are very much higher among industrial workers, and notwithstanding the fact that ten or fifteen years ago the federal bureaus recommended that milk be used in industry to combat certain diseases."

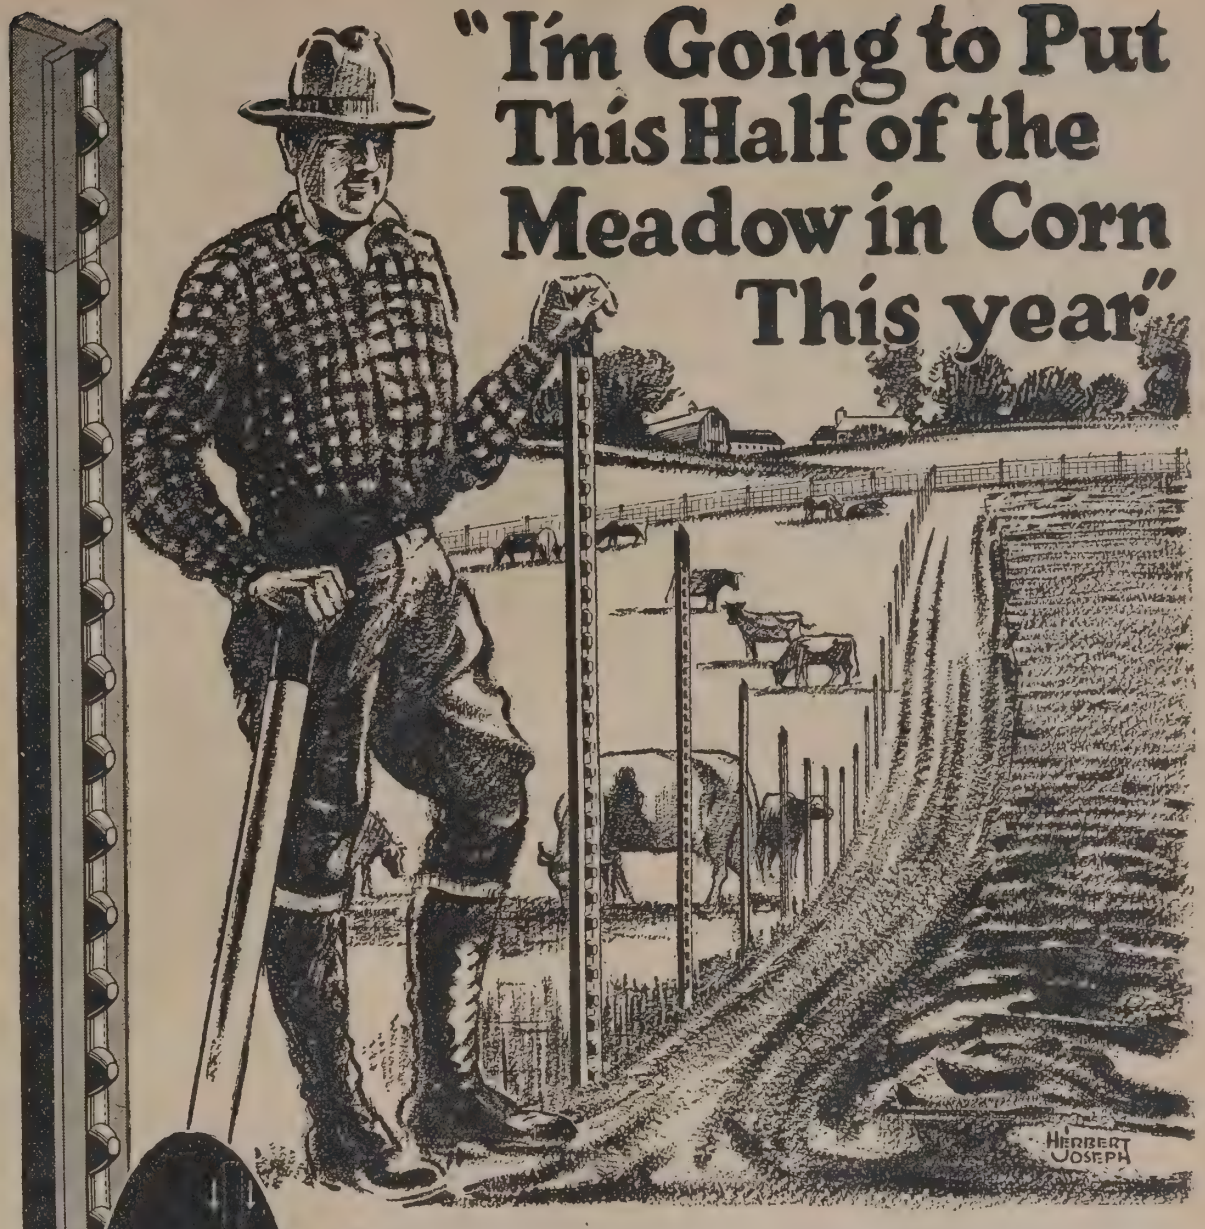
It is the contention of Dr. McCord that there is, in all probability, a very definite relation between *improper feeding* and factory production, the occurrence of accidents, absence from work, general plant morale, industrial fatigue, tiredness, labor turnover, length of life of the workers, and a number of other big problems directly concerned with the welfare of upwards of 27 million people engaged in the industries of the United States. He cites the control of lead poisoning as but a single example in which the use of milk has been very valuable.

An Alfalfa Campaign

HOARD'S DAIRYMAN:—The banks of King County, Washington, are backing an alfalfa campaign which is arousing much interest among the dairymen who produce milk and cream for the Seattle market. Fifteen banks in eleven communities have offered prizes to the farmers in their own districts, while three of the Seattle banks have contributed a total of $150 to be given in three prizes for the three best plantings of alfalfa in the entire county. The total prize money makes an aggregate sum of $785.

The contest is a repetition of one held in the Snoqualmie Valley last year which resulted in many new seedings of alfalfa. It is being sponsored by the extension service under the direction of Will W. Henry, the county agent. This year's contest was made a county wide affair because of the interest it caused last year and the opportunity given the banks to encourage better farming in their own community.

Most of the banks have offered three prizes for contestants in their section. The first prize winners in each community are to be automatically listed for the county-wide contest which offers $85, $40, and $25 for first, second, and third prizes respectively.



It is estimated that at least $250,000 worth of alfalfa is brought into King County annually from Eastern Washington. Demonstrations carried on under the direction of Mr. Henry have proven that alfalfa can be grown profitably in King County. A few suggestions for growing alfalfa under Western Washington conditions have been offered farmers who care to try out this crop and enter for the contest. Mr. Henry expects to see many new plantings of alfalfa made in the county this spring as a result of the contest.

The score card used in judging the plantings to award the prizes will be as follows:

	%
Selection of soil, kind, and drainage	20
Preparation of soil	25
Condition and uniformity of stand	20
Vigor and color of plants	10
Freedom from weeds	20
General field appearance	5
Total	100

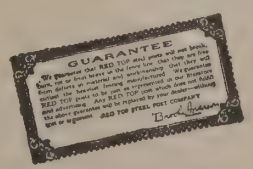
Washington. RALPH ERSKINE.

It is better to be silent and thought dumb than to speak and remove all doubt.

With the RED TOP Post Driver one man can drive 200 to 300 posts a day

WITH good fences sturdily and permanently supported by RED TOP Steel Posts, approved rotation of crops and pasturage is practical and profitable. This year's meadow gives next year's bumper crop to be followed by crop rotation—according to your plan. No matter how large or small the farm, good fences provide for intensive profitable farming. Good fences depend on good fence posts. It is a foolish waste to put up good fences on poor posts. If erected at first on RED TOP Steel Fence Posts they give the most years of service. No repairs, no restapling, no expensive post replacements, for RED TOPS outlast 4 or 5 ordinary wood posts. And, better still, you can install RED TOPS at *any time of the year*. No need to wait on fence work after planting. Do it NOW—for RED TOPS drive easily regardless of the condition of the soil. One man with the RED TOP driver can drive 200 to 300 posts a day—a great saving in time and cost of labor. Once in, RED TOPS hold their alignment, are never "thrown out" by frost—need no "going over" in the Spring, hold the fence upright and secure for many years—as long as the fence lasts.

Red Top
GUARANTEED
Steel Fence Posts



RED TOP Steel Drive Fence Posts mean only *one* job of fencing. They last for years but—if you want to change a fence line—are easily withdrawn and re-driven in a new location so quickly that there is little work involved in changing a fence.

And don't overlook the value of RED TOPS for post replacement. Wherever a wood post has failed, drive in a RED TOP. Fasten the fence to it with the RED TOP handy fastener. In a few years you will have replaced all the rotting wood posts, your fence will be permanent and all your fence post work will be *done* for many years to come.

RED TOPS give the farm that "well kept" look. They permit closer cultivation. They harbor no destructive insects, promote no fungus growths. Prevent losses from lightning by grounding the flash without damage. In short, the farmer who neglects to go at once to the RED TOP dealer and find out all about their convenience and economy is overlooking many dollars in savings and profits.

Find out how easy RED TOPS are to drive; how many costly hours of labor they save over a period of years; how sturdy and permanent they make the fence, and hold it in perfect condition. Every RED TOP is guaranteed.

Try and figure out how you can possibly afford to go on building fences with ordinary wood posts when you can save and make so much more from your farm by using RED TOP Steel Drive Fence Posts.

RED TOP Steel Fence Posts Are Guaranteed

One Lever Locks 2 to 50 Cows

THE greatest time-saving convenience ever invented in barn equipment is the West Bend Automatic Stanchion with locking, releasing lever—**the original, lever-operated, swinging stanchion.** Costs no more than ordinary stanchions that must be closed and opened singly by hand. It also assures safety in locking up or releasing cows. One throw of the lever locks or releases the entire row of cows, controls from 2 to 50 stanchions. **Cow stops are operated at the same time,** guiding the cows into the stanchions. Enthusiastic owners everywhere. **Write today** for big free catalog showing complete line of West Bend Barn Equipment.

Honor Wisconsin Agricultural Leaders

FOR eighteen years the College of Agriculture of the University of Wisconsin has followed a unique and original custom of conferring each year honorary recognition upon a small group of people who have rendered signal service to agriculture in this state and nation. This University was the first to confer engraved testimonials upon practical farm folks in recognition of their services, regardless of how limited their early training may have been.

The testimonials of Honorary Recognition were conferred this year upon the following men during the annual Farmers' Course at the Wisconsin College of Agriculture:

William Henry Hanchett

William Henry Hanchett was born on a partly improved 40-acre timber farm in Monroe County, Wisconsin, March 24, 1867. He received most of his education in the district school, attending school only winters after he was twelve years of age. At 14 years of age, he became the farmer of the family and was confronted with the problem of getting an income, sufficient to provide for a family of eight, from a small piece of land. With this in mind, he commenced experimenting with small fruits. He thus became a pioneer in a movement which has since made Monroe County well known as the great small fruit center of the state.

W. H. HANCHETT

The matter of maintaining soil fertility soon became a serious one on the Monroe County farm; and after some study he decided to add a dairy herd as an adjunct to his small fruit business. He started to grade up his herd, and shortly thereafter assisted in the organization of the Sparta Co-operative Creamery, serving as president for 12 years. In 1908 he assisted in the formation of a county Guernsey breeders' association, one of the first accomplishments of which under his presidency was the distribution of 50 pure-bred bulls within his county. He joined the first cow testing association in his county and assisted in the organization of the local American Society of Equity that acts as a live stock shipping association.

Rodman B. Melvin

Rodman B. Melvin was born on a farm in Sheboygan County, Wisconsin, November 12, 1860. He has made his home continuously in the county, the greater part on the farm on which he was born, and one which he later purchased, now operated by his son, Homer. For over fifty years the milk from Mr. Melvin's farm has gone to the same cheese factory, the Greenbush factory, one of the first to join the Wisconsin Cheese Producers' Federation, an organization of which he has served as secretary and treasurer since the first group of officers was elected in 1913.

R. B. MELVIN

For a great many years Mr. Melvin has been a breeder of pure-bred Holstein cattle. In fact, he was one of the pioneer breeders in Sheboygan County. When for purpose of mutual advancement the breeders of the county organized the Sheboygan County Holstein Breeders' Association in 1909, Mr. Melvin was elected president, and served in that capacity up to 1914.

Jens Jenson

An emigrant lad is Jens Jenson. He was born in Denmark, November 26, 1868, and came to the United States with his parents in the spring of 1873, locating on a farm near Bone Lake, Polk County—the same farm now owned by Mr. Jenson. It was always his ambition to get the best farm in the town, and notwithstanding all the time he has spent away from the farm in trying to improve his own and his neighbors' conditions, he has never neglected the farm, and now has a place with all the modern improvements both in the dwelling and the barn and outbuildings.

JENS JENSON

Up to 1921, practically all the butter manufactured by Polk County creameries was shipped by local freight. As secretary of his home creamery, Mr. Jenson saw that a saving could be made if all the creameries shipping on the same railway pooled their products and sent carload lots only to the eastern market. It took a lot of hard talking to convince all the creamery managers, but in 1921 the first carload of butter went out of Polk County. He soon learned that if the creameries of Polk County could send butter to the market of the same grade, a much better price could be obtained, and as a result of his work, a field man was engaged the same year. He is a member of the executive committee of the Land O' Lakes Creameries Association.

Stoughton Willis Faville

Twelve children were in the families of both the great grandfather and the grandfather of Stoughton Willis Faville. They lived in Herkimer County, New York. The father of the man who is now receiving the highest tribute that Wisconsin can give its men of the field and furrow, came to Wisconsin in 1843, settling near Lake Mills.

S. W. FAVILLE

In 1844 Alpheus, the father of Stoughton, bought three forties of government land. This land is now a part of Faville Homestead. On this farm Stoughton Willis Faville was born, February 12, 1852, and on this same farm he was reared and for nearly half a century has been its owner and manager.

In 1882 a pure-bred Holstein-Friesian sire was bought for this farm, the first registered Holstein to come to Jefferson County. From this beginning Mr. Faville has grown a pure-bred Holstein-Friesian herd of about ninety animals, including from fifty to sixty cows. His farm of 400 acres, a mixture of upland and grass land, has been almost entirely cultivated for the forwarding of the dairy interests of the state, and Mr. Faville has been for years a wise leader and a safe counselor in this industry. He has also been a leader in demonstrat-

ing that hard work with conservative, intelligent, and patient methods win in dairying.

Edward L. Divan

Edward L. Divan, Wisconsin, was born in Green County, Wisconsin, March 16, 1867, on the farm now owned by him. He owned his first registered hogs in 1896, and has been a breeder now for thirty years. He began the breeding of registered Shorthorn cattle in 1898, and exhibited at the Wisconsin State Fair and many of the leading county fairs for ten years. In 1904 he exhibited at the World's Fair in St. Louis. Six years later he dispersed his Shorthorn herd and in 1914 commenced the breeding of registered Holstein-Friesians. He did his first stock judging at county fairs in 1909; since that time he has acted in that capacity 102 times at 27 different fairs in Wisconsin and Illinois.

E. L. DIVAN

Mr. Divan helped organize and was president of what was known as the Cadiz Horse Company in 1910, bringing into his locality some of the best Percheron and Shire stallions for the purpose of promoting the breeding of better horses.

It is said that no man in Green County has given more free service in church, school, and community socials in the way of music, home talent plays, and other entertainment than Mr. Divan. His friends claim that he gives one-half of his time to the community and state.—A. W. HOPKINS.

Tillamook Sells Cream

HOARD'S DAIRYMAN:—The Portland market offering 54 cents, with four cents premium for Tillamook sweet cream, the Tillamook County (Oregon) Creamery Association decided in December to discontinue making cheese at four of its largest factories. It will separate about half of its milk and dispose of it in the form of cream; at the same time concentrating at its other factories on the production of loaf cheese, for which there is fair demand as against almost none for triplets. Thereby it will convert into butterfat the milk which produces the cheese of least value, and through lowered production of cheese it will be able sooner to dispose of storage stocks, and probably at high prices. If there is material difference between the returns from butterfat and those from cheese, it will adjust these differences between the several factories through the storage fund.

While there may not be as much money in butterfat as in cheese at present asking prices, it is conceded that present asking prices may not be realized; and since one cent per pound in May or June means considerably more to the dairyman than five cents in December, January, or February, Manager Carl Haberlach holds it desirable to dispose of storage stocks before new cheese comes on in the spring. He points out that 1925 was a year of low production for the association, that it sold 10,000 boxes of cheese to the processers, and that a year ago it had no cheese in storage. In 1926 the association produced 10,000 pounds more than last year, sold none for processing, and had in storage at the end of the year more even than two years ago.

Rather large storage stocks all over the Pacific coast bring the possibility of lower prices. The answer was to sell sweet cream on a favorable market rather than to continue producing cheese. The move presents another illustration of how organized dairymen may suit their production to market conditions, as non-co-operating dairymen may not. It is merely orderly marketing in another form.

Oregon. G. N. ANGELL.

Then I Want to be at Home

When the grilling day is over and the sun is going down; when the shades of night are falling on the country and the town; when the whippoorwill is calling and the wolf begins to roam; when the mocking bird is dozing—then I want to be at home!

When the storm clouds in the offing and the mighty thunder rolls; when the lightning cleaves the heavens and the squirrel hunts his hole; when a sickening, inky blackness hides the azure dome; when the storm breaks in its fury—then I want to be at home!

When the pink rosebuds are swinging so gently in the breeze and the glorious sun is shining on the warblers in the trees; when the air is perfume-laden and the summer days have come; when all nature seems a-blooming—then I want to be at home!

When the winter snows are drifting in the icy, cutting gale; when the winter wind is moaning a lonesome forlorn wail; with icicles on the barn roof like teeth in a mammoth comb; when the sparrows beg their breakfast—then I want to be at home!

When life is nearly over, when I face the great divide, listening to the voices calling to me from the other side; when the last great call is sounded and my final day has come, there's one prayer that I would offer —then I want to be at home!—Author Unknown.

BELLA VEEMAN SEGIS MATADOR

One of the good daughters of Matador Segis Walker owned by the Carnation Milk Farms. She produced 32,217.6 lbs. milk, 998.4 lbs. butterfat (1,248 lbs. butter) in a year; has one 45-lb. 7-day record, and recently finished another above 36 lbs. butter in 7 days.

like a battleship

ITS RIBS of steel give to the battleship the utmost in strength, combined with the utmost in speed and freedom from unnecessary weight.

Its ribs or "muscles" of tough, live rubber give to Top Notch Buddy Boots the utmost in long service combined with the utmost in wearing comfort and light weight.

The "muscles" of Buddy Boots are a patented, exclusive feature. They protect the sides of the boot, strengthen them and prevent them from cracking. The "Boots with the Muscles" are not heavy or clumsy yet they will outwear any boot you ever bought.

Soles and heels are double-thick. There's a special rubber strip reinforcement next to the sole. The trim-shaped leg prevents the foot from sliding up and down.

Only the toughest, livest rubber goes into Top Notch Buddy Boots. We make each pair by hand from start to finish. They give you the most for your money in wear and comfort.

Rubber footwear for all the family

BOOTS, arctics, heavy and light rubbers, all styles and sizes for men, women and children. Made with unusual care to safeguard our 26 years' record for building durable, distinctive footwear. Ask for Top Notch Rubber Footwear by name and look for the Top Notch Cross. The best stores carry it or will get it at your request.

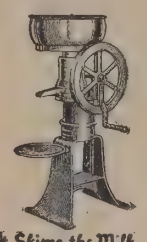
TOP NOTCH

A GUARANTEE TOP NOTCH OF MILEAGE

A scene sketched from a photograph taken on the farm of Jake Lahr, Eden Valley, Minn.



It Milks the Cows Clean

Dairymen Say It's the *Perfect* Teat Cup

"I have now used the Burrell Milker five years without missing a single milking. Under normal conditions, the Burrell leaves no hand stripping. And if there is a cow in the herd that has sore teats, she can be milked with the machine without trouble. It seems the Burrell Teat Cup is perfect."—*Jake Lahr, Eden Valley, Minn.*

THE strongest claims for the Burrell Milker are made by Burrell users. Thousands of them summarize their experience and express their praise of the Burrell Milker in the single sentence—*"It Milks the Cows Clean"*. And one of the reasons why it milks the cows clean is the Burrell *Air-Cushion Teat Cup.*

It Skims the Milk Clean

For many years, the wonderful Link Blades of the Burrell-Simplex Cream Separator have made it famous as the *closest skimmer.* It has a greater capacity for the size of its bowl, for the speed at which it is operated, and for the power required to run it than any other separator. It is simple, light and easy-running. But, above all, *it skims the milk clean*—and that's what you want in a cream separator. Four sizes—350, 500, 750, 1000 lbs.—hand or power driven.

It Cushions Teats with Air

The vacuum suck pulls the air out of the air reservoir, at the top of the cup, over the square shoulder, creating an air cushion which supports the teat. Between sucks air returns to the air reservoir, thus giving complete relief. The Burrell Air-Cushion Teat Cup—made of pure nickel silver—has no dangerous rubber linings. It is simple, sanitary—and *comfortable.*

4 Exclusive Features

(1) The *Automatic Controller,* which regulates the suction to suit exactly each individual cow; (2) the *Air-Cushion Teat Cup,* which supports and compresses the teats by air alone; (3) the *Sanitary Moisture Trap,* which entirely prevents contamination of the milk from the pipe line; (4) the *Positive Relief Pulsator,* which gives complete rest between pulsations and assures natural circulation—these four exclusive features make the Burrell practically a *perfect* milking machine.

Send For Valuable Free Books

Here are two valuable, illustrated books that are free to dairymen. One pictures and describes the Burrell Milker and explains how *"It Milks the Cows Clean"*. The other tells about the Burrell-Simplex Cream Separator—all about its simple, sanitary, rugged construction, and how *"It Skims the Milk Clean"*. Every dairyman should have both of these interesting, practical, helpful books for handy reference.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative. destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Favors Export Bounty

HOARD'S DAIRYMAN:—During the past two years we have watched Congress labor over various farm relief bills. Some of them I thought were good, some not so good, and some were very bad indeed.

The great city papers steadily contend that nothing can be done by legislation to help the farmer, apparently forgetting that the McKinley tariff made U. S. steel what it is; that the Adamson law has benefited railroad employees by millions of dollars; that the Esch—Cummins law is beginning to make railroads feel comfortable.

The National Grange recently endorsed a bill that seems to me to eliminate about every objection that has been raised against other bills that have been considered in previous years. Perhaps, on that account, it might have a fair chance to pass. This is known as the Debenture Bill. As explained to me it is simplicity in itself; perhaps that is its greatest asset.

Suppose that the tariff on wheat was 35 cents per bushel. If this bill passed, an exporter would receive from the government a debenture for 35 cents on each bushel that he sent abroad. This debenture is not a demand upon the U. S. Treasury nor is it money, but it is negotiable and it can be used as payment of duty on incoming goods of any kind. Thus, if your exporter were also an importer he would use the debentures the same as money in paying duty on imports. If he were not an importer he would go across the street to a man who was, and sell them.

The effect would be that your exporter, knowing that he could realize 35 cents on his debentures, would at once bid nearly or quite 35 cents more for the wheat to send abroad. If he didn't his competitor would, and competition would compel about this much change in prices. Thus, our farmers would actually receive the full benefit of the tariff, as they should. Of course not all of the wheat would be exported, but enough would certainly go so that the remainder would be worth as much here at home as it would bring if sent abroad. This principle would be applied to the other grains as well as to wheat, to cotton, pork, and most of our important products.

The plan calls for no large amount of government financing, for no money changes hands unless the exporter sells debentures to an importer. The only cost to the government would be a slight one for clerk hire to look after the matter.

The most important objection that has been made to the farm relief measures is that they might increase production. I have given this matter a lot of thought and believe the objection not well founded. So far as most of us are concerned, we are doing as much work and producing as much now as we are capable of. It is said that acres of poor land, particularly in New England States, would be reclaimed from abandonment and thus add to the production. Suppose that this argument were true, it is equally true that the tide is still running strong towards the city; that few of our sons even consider farming because they can make many times as much money in the city as they can here; and it will take more than a little improvement to change this situation. I believe that it would more than offset the rehabilitation of poor farm land in all the states.

I talked the plan over with a friend in the city. After pondering awhile he said, "Apparently it costs nobody anything. Actually of course it does cost, it reduces the government's income from the tariff. At present I am told about 13 per cent of its income is from tariff and part of that would be stopped. I guess the administration would have to depend more on the income tax and stop talking about part refunding them. For my part, I am for your Debenture Bill. It makes me mad clear through to have the government talk about refunding part of the income tax. I don't want mine back. I'd only get a little and if we had real farm relief I'd get four times as much in increased business. I have talked to other city men, especially manufacturers, and they say the same thing."

It seems to me that his argument is well founded, because if all of us were making a little money we would spend part of it on things that the cities have to sell us.

denominationalism is sin because it divides. Not until we forget "our denomination" and take the Word for what it says, will we become free.

To the greater part of these writers I would like to say, "How readest thou?" If we are to keep the Sabbath Day holy because it is so commanded in the law of Moses, then we must also put in six days at work. Yes, and Mr. Ford is wrong in advocating the 5-day week for work. And remember, that if we are still under this law given to Moses, we must also keep holy every new moon; never kindle a fire on the Sabbath; not cultivate the land on the seventh or sabbath year, and at once put to death every man who violates the law of the Sabbath or for that matter any of the Ten Commandments, etc. Who does this or even advocates it? This and more is all under the law given to Moses for Israel, and if the old Mosaic law is now in force we must keep all of it.

But when will we learn that all this has been done away in Christ? There is no Sabbath now in the sense once understood. Neither is it correct to call Sunday the Sabbath. It never was and never can be. We are now under the Gospel dispensation, and if we use New Testament terms it will save a world of confusion. The old prophet, Jeremiah, said a new covenant would be made (Jer. 31:31-32) and Paul says it has been made and that the old is done away (Heb. 8:8-30).

Let us not swallow down what some preacher may have said until we do as the disciples did in the days of the apostles (Acts 17:11). Do not hold to what we heard our great uncle say, but cut loose and see what the Book says.

New York. E. J. WATERSTRIPE.

Observing a Day of Rest

HOARD'S DAIRYMAN:—The people who think everyone should observe the seventh day of the week have been doing a lot of writing. If they wish to keep the seventh day as Sabbath I am sure no one will object, but I despise to have them try to force their opinion on Gentiles who do not agree with them.

In the first place, it is impossible to observe any day of rest if one is a farmer. I have not had a day of rest when at home for 12 years, yet we always attend church, but work several hours before going and after returning. Live stock must be cared for and it is just as bad to hire some one to do my share of work on Sunday as to do it myself.

In the second place, the Sabbath was for Jews only, and Gentiles were not allowed to observe it under penalty of death. Read Deut. 5-15 and Exod. 31-17. The latter prophets allowed strangers, i. e., Gentiles, to keep the Sabbath with Jewish friends, but it was optional, not commanded.

In no place in either the Old or New Testaments are the Gentiles ordered to keep any day of the week as Sabbath. The early church fathers observed the first day as a memorial of our Lord's resurrection, while Jews were commanded to keep the Sabbath as a memorial of their deliverance from Egyptian bondage.

However, deliver me from being a quibbler over non-essentials. All who accept Jesus as the Son of God, confess their sins, and acknowledge Christ before men will be saved, no matter if they work 7 days a week as thousands of men must work to sustain our modern civilization. Jesus gave us two commands: to love God and to love one another. The first command He explained as believing on Him (Jesus) whom God sent; the second is to love our neighbor as we love ourselves.

Illinois. ZENAS SPIGER.

The Corn Borer

HOARD'S DAIRYMAN:—Much has been said of the corn borer, but from appearances about all that's been done is talk. The quarantine is far from being sufficient. A few men are stationed on highways. They stop cars, "Have you any green corn in your car?" "No." "All right, proceed." Fact is these cars may and do have sacks or bushels of green corn. The law does not search the cars.

Much stress is laid on the fields of corn belonging to farmers. Nothing is said about the plots and lots of ground planted by suburbanites, every hill of which is a possible breeding place for the corn borer. What is the use of a few doing everything in their power to stamp out this pest, when a great many, yes, farmers, also, do nothing about it. If strict measures are not adopted very soon, the great corn belt of the United States will be infected.

Severe penalties should be inflicted on all those not obeying the law to the letter. What are we going to do about it?

(MRS.) G. W. CAMPBELL.

Wisconsin.

Think More

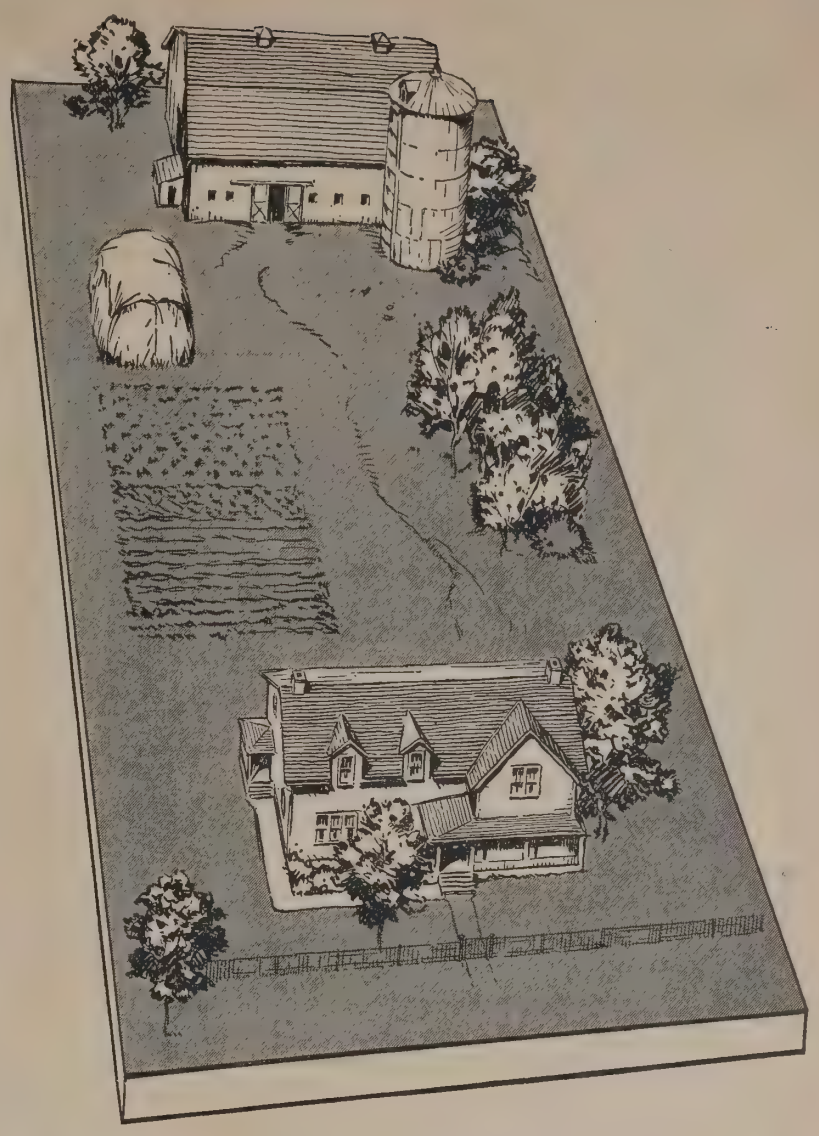
HOARD'S DAIRYMAN:—In answer to Sam B. Wood, in regard to the observance of Sabbath, would say that he is like all others of the same type; he quotes only those passages out of the Bible that "water on his mill." In Mark ii 27 we find: "And He said unto them—meaning Jesus—'The Sabbath was made for man, and not man for the Sabbath.'" In Romans XIV—5 we find: "One man esteemeth one day above another; another esteemeth every day alike. Let every man be fully persuaded in his own mind."

If nobody were allowed to work on Sunday, who would heat the churches, no street cars, how could people get to church? Think of the fire department, the doctors, and please *think! think! think!*

Wisconsin. HENRY A. OCHSNER.

Common Sense Suggestions

HOARD'S DAIRYMAN:—Counter suggestion to suggestion by Wm. H. Skinner in December 25th issue, permit me to ask, if Mr. Skinner realizes that he is receiving the paper for three years for one dollar, hardly the postage on it, less than 2c per copy, while the Literary Digest would in the same time cost $12. I am willing to turn pages for my part and would suggest that Hoard's Dairyman place their articles in any way that will pay them the best. The readers get the benefit of one of the best papers there is, and yet so cheap that I for one will not object, but rather defend or boost.



Why holler that a Ford has not as much convenience as the Lincoln, if a Ford is all you pay for and hardly that? Why line up as argument or criticism something which costs, as this paper deal, 1200% more. Me for Hoard's Dairyman as she is. "The Feeding of Dairy Cows" taken by correspondence or at school would maybe cost $25.00 and then some.

North Dakota. HELMER TWITO.

Gets His Goat

HOARD'S DAIRYMAN:—I think your paper is the best all-around farm paper there is but I can't keep from putting my approval on the article of Wm. H. Skinner, on hiding the tail end of an article in among the advertisements. It certainly does get my goat to have to turn to the back end of a paper to finish any article I am reading.

Montana. C. C. BOYD.

The *one* Wallboard *for all* FARM Uses

Wherever you want to use wallboard in any farm building Sheetrock has the qualities for the job.

It combines in *one* wallboard *all* the values of *fire-safe insulation* at *low cost.*

FIREPROOF . . . INSULATING . . . VERMINPROOF . . . NON-WARPING . . . TIME-TESTED . . . TAKING ANY DECORATION . . . EASY TO PUT UP AND PUT UP TO STAY

Sheetrock is made from pure unadulterated gypsum. 3/8 inch thick and specially surfaced for strength.

With the exclusive U S G reinforced joint system all joints are sealed and concealed, and the smooth flat surface of Sheetrock takes any decoration, wallpaper, paint, or *Textone*, the plastic paint that combines both tone and texture in beautiful results.

You can always tell Sheetrock by the USG Sheetrock brand on every sheet, with the Underwriters' stamp of approval. Made only by the United States Gypsum Company. Your local dealer has it in stock or can get it for you promptly from our nearest mill.

Sheetrock is inspected and approved as an effective barrier to fire by the Underwriters' Laboratories, Inc.

Pennsylvania Dairymen Meet

HOARD'S DAIRYMAN:—Dairy interests ran high during the Eleventh Annual Pennsylvania State Farm Products Show at Harrisburg, January 17 to 21. With the recent advance of one cent a quart received by members of the Inter-state Milk Producers' Association, dairymen were in good spirits and took an active part in many of the 27 farm organization meetings which met during the week.

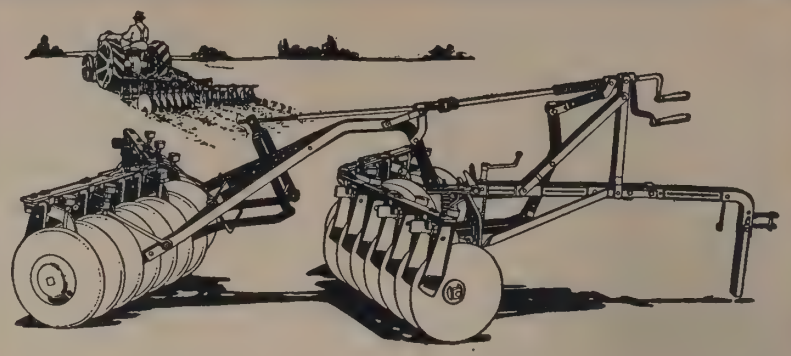
All day Wednesday was devoted to a meeting of the State Dairymen's Association. Several speakers of national note made addresses. At the election of officers for the coming year E. B. Fitts, State College, received the presidency and Robt. F. Brinton was retained as secretary.

There were 146 entries in the milk contest. This is eleven more than were in the running last year. The highest score made was 99 and fifty-nine per cent of all entries scored 96 or better. Thomas & Howell won first for raw market milk from T. B. free cows; B. D. Carter was first for raw market milk; first for certified went to Lenker Farm Dairy; and Abbotts Alderny Dairy carried away the gold medal for pasteurized.

The annual dairymen's banquet held Wednesday evening was the largest ever at these midwinter meetings. It was the first official appearance of the new state secretary of agriculture, Dr. Charles G. Jordan, before a body of dairymen and he gave them his assurance that he was strong for the general clean-up T. B. work which is going on throughout the state.

The guest speaker from outside of the state at the banquet was A. J. Glover, Editor of Hoard's Dairyman. He presented in a convincing way the nation wide problem of the boarder cow and interspersed with many clever stories told what could and has been done to overcome the great loss she makes.

The dairy cattle exhibits every year at the show are cut to the minimum because of the lack of suitable quarters. The feature this year was eleven bulls from the association rings in McKean County. This is the only county in the United States which has bull associations of the four major dairy breeds, Jerseys, Holsteins, Guernseys, and Ayrshires, and each of them were represented in Harrisburg by three or more individual animals.



The Ayrshire breeders attracted attention by a guessing contest. George F. Taylor donated a pure-bred calf for the person who could come nearest the average yearly production of 270 cows which were kept last year under the Ayrshire test plan.

The Pennsylvania Federation of Holstein-Friesian Clubs at its annual meeting passed a resolution looking to correct the recent difficulties encountered in paying indemnities for condemned animals. It would have the state legislature amend the law so that only animals registered in an association organized before the law went into effect would be entitled to the increased payments for indemnity.

Pennsylvania. T. H. WITTKORN.

Another 1,000-lb. Holstein

One hundred nine Holstein cows have produced over 1,000 lbs. of butterfat in a year, according to a recent announcement made by Supt. Gardner of the Holstein Advanced Registry Dept. The latest entry into the ranks of 1,000-lb. producers is N. P. Segis Gerben Re-Becky, owned by the University of Nebraska Substation. She produced 27,110.2 lbs. milk, 1,006.64 lbs. butterfat (1258.3 lbs. butter) in a year as a 6-year-old.

You Can Disk Better with a John Deere

A thorough job of double-disking is certain in any field condition where a disk harrow can be used to advantage, when you use the

John Deere

Model L Tractor Disk Harrow

The Automatic Yielding Lock Coupling which connects the front and rear sections compels the rear disks to cut out the ridges left by the front disks. The rear section is locked when the harrow is traveling straight ahead. On the turns, a coil spring yields and unlocks the coupling, preventing dragging of the harrow.

The disks can be instantly angled or straightened by the man on the tractor, without stopping or backing the outfit.

The Model L is flexible, with sufficient weight, proper style of hitch and correct design to penetrate, pulverize and compact the soil its full width.

Write today for descriptive folder; also for educational booklet, "Bigger Crops from Better Seed Beds", printed in four colors. It's a book every farmer will appreciate. Address John Deere, Moline, Ill., and ask for Booklet LS-714.

World's Greatest Advance in HARNESS Making

No Buckles
No Rings

$5 After 30 Days FREE Trial

9 Months to Pay

No Buckles

About two-thirds of strength of strap is lost by pulling from buckle tongue. Ordinary harness has 68 buckles. Walsh has NO buckles.

No Rings

Friction caused by rings wears straps in two. Ordinary harness has 275 points of ring friction. Walsh has none.

No Holes

Ordinary harness has about 275 holes that weaken straps. Walsh straps have no holes in them.

No Billets or Loops

Ordinary harness has about 70 billets and 100 loops. Bunglesome to handle in cold weather or in the dark. Walsh harness has no loops or billets. Handiest harness ever made.

WALSH NO-BUCKLE HARNESS

Breakdowns with old harness mean costly delays. It doesn't pay to patch old buckle harness. Send for a Walsh on 30 days free trial now. Send no money. If it doesn't sell itself, return at my expense.

Free Book Describes New Method

How Walsh makes the world-famous No-Buckle harness—the world's greatest advance in harness making—no buckles to tear straps, no rings to wear straps, no holes to weaken straps. 40 patented exclusive features. Imitated, but never matched.

Hand Pick Pea Seed

HOARD'S DAIRYMAN:—A warning is being broadcasted to all growers of peas—especially to those who expect to plant peas for the production of dried peas next spring—to be very careful in the selection of their seed and under no circumstances to plant pea seed that has not been carefully hand picked.

Dealers are having difficulty in selling dried peas for food that contain a mixture of types such as many farmers have been marketing during the past few years. If Scotch peas are sold they must contain no white or green peas. The same is true of other varieties. They must be pure Scotch, or pure Green, or pure White Field—or whatever the variety may be. Even a slight mixture will make them less desirable, and a price reduction will result.

This is the time of the year for growers to prepare for the spring seeding. The time spent in hand picking the pea seed wll be amply repaid not only in securing a good price for the crop—but also in maintaining a market which we stand in great danger of losing altogether because of inferior quality.

The labor for cultivating the soil and for planting and harvesting is identical whether good or poor seed is planted. There is plenty of risk run by the farmer even when the best seed is planted. Weather conditions can make or mar the crop, but with poor seed it is an absolute certainty that an inferior crop will result with its inevitable sequence of difficulty in selling, loss in cleaning, and reduction in price.

Wisconsin. WM. N. KNAUF.

Feeding Value of Soy Beans

What is the feeding value of ground soy beans compared with linseed meal? With silage and clover hay as roughage, what proportion of ground soy beans should be put with ground corn to balance the ration? Should any other concentrate be added?

Dallas Center, Iowa. H. W. K.

Ground soy beans are very similar to linseed meal in protein content, but higher in total digestible nutrients due to the greater content of fat, there being 16.1 per cent fat in the beans and only 6.7 per cent fat in the linseed meal. In feeding trials the soy beans have proved to be the equal of linseed meal. They should not be fed in excessive quantities else a soft butterfat is produced. They should not constitute more than one-fourth of the concentrates mixture, neither should they be the only high protein feed used in the mixture.

For silage and clover hay we suggest a mixture of 500 lbs. of ground corn, 200 lbs. of bran, and 100 lbs. each of ground soy beans and either linseed meal or cottonseed meal. This mixture contains about 14 per cent of digestible protein. The bran is included to lighten the heavier feeds and to add bulk. The linseed meal or cottonseed meal is added to give greater variety of sources of protein.

If one had oats to add to the mixture, we suggest a mixture of 400 lbs. of ground corn, 200 lbs. of ground oats, 200 lbs. of bran, and 100 lbs. each of ground soy beans and either linseed meal or cottonseed meal.

Feeding Dry Cows

I give my Holstein cows mixed timothy and clover hay about all they care for. They also have the run of a cornstalk field when the weather is nice. They are warmly housed at night. In addition to this, I feed my cows in milk 2 bundles of sheaf oats in the evening and about 4 lbs. ground corn and 1 lb. linseed meal mornings and evenings. What do you think of this ration?

Wall Lake, Iowa. F. B.

Mixed timothy and clover hay plus cornstalks are not enough to build dry cows up to a desired condition for calving, particularly if these cows were in medium to thin condition when they finished their lactations. If no other roughage is to be obtained these dry cows should have enough grain to build them up to reasonably good flesh for their next calving. A mixture composed of 400 lbs. ground corn, 200 lbs. ground oats, 100 lbs. bran, and 100 lbs. linseed meal is suggested. It should be fed according to the condition of each individual cow. We suggest in addition to this that these dry cows be given access to a mineral mixture composed of equal parts by weight of salt, bone meal, and finely ground limestone. We would not expect the cows to get much from the cornstalks.

For the cows in milk, the ration does not contain enough protein. We suggest a mixture composed of 600 lbs. ground corn, 300 lbs. bran, 150 lbs. linseed meal, and 100 lbs. cottonseed meal. If legume hay, alfalfa, red clover, or soy bean hay were substituted for the mixed hay and the sheaf oats continued, a mixture composed of 400 lbs. ground corn, 200 lbs. bran, and 50 lbs. each of linseed meal and cottonseed meal would be satisfactory.

A pompous man missed his silk handkerchief, and accused an Irishman of stealing it. After some confusion the man found the handkerchief in his pocket, and apologized for having accused the Irishman of stealing.

"Never mind at all," said the latter. "Ye thought I was a thafe, and I thought you was a gentleman, an' we were both mistaken."—Exc.

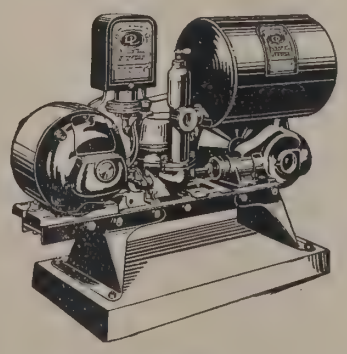
WATER UNDER PRESSURE
Wherever You Want It



WITH a D-L Water System you can have cold, running water at the barn and in the dairy, hot and cold water for bathroom and kitchen, water under pressure for fire protection, *water wherever you want it by simply turning a faucet.*

No More Hand Pumping—No More Water to Carry

Once a D-L Water System is installed, the need to pump and carry water is ended—ended forever. Think what this means. Think of the saving in time—the saving in steps—the convenience in performing household tasks—the greater ease in doing the chores.

D-L Water Systems are made in types and sizes for every farm or city home—for wells or cisterns—for use with farm electric plant or central station current. And prices are as low as $83 and up, f. o. b. Dayton, Ohio.

There are D-L pumps for wells or cisterns—for use with farm electric plant or central station current.

Made and Guaranteed by Delco-Light Company

D-L Water Systems are made by the Delco-Light Company, builders of the famous Delco-Light farm electric plant. They are fully guaranteed. They are backed by General Motors. And purchase may be made upon the convenient terms of the General Motors payment plan.

Delco-Light Electric Plants for Use with D-L Pumps

If you are not within easy reach of a central station power line, or if you do not already have a Delco-Light farm electric plant, ask us to send you complete information about a Delco-Light plant that will generate ample power for operating a D-L pump, furnish current for running all small power farm machinery—and, in addition, supply you with *—clean, safe, brilliant electric light.*

EDITORIAL COMMENT

THE main thing in all properly conducted dairies should be the proper treatment of cows. They should never be spoken to harshly, much less beaten, and never hurried. Let every cow feel that you are her friend. Discharge a hired man without ceremony who kicks or strikes a cow. The cow should be the queen of the farm.

CHRISTENED WITH MILK

The giant steel carferry, Madison, was recently launched from the Manitowoc ship-building yards, and it was christened with Wisconsin's greatest product—milk. The vessel is one of the largest of its kind on the Great Lakes, and will be put in service by the Grand Trunk Railway.

When Marion Dixon, daughter of a director of the road, smashed a bottle of milk on the hull of the big carferry, she also smashed a precedent of many years' standing. It has been the custom of years to christen newly built ships with champagne, but in this case the desire was to pay tribute to Wisconsin's largest source of wealth, the dairy cow.

This innovation was due to the activities of the Milwaukee Association of Commerce in requesting that this be done, and in complying with this request the Grand Trunk Railway has evidenced its desire to do honor to the dairy cow and to aid in advertising her product. As an innovation, this milk christening was news and was flashed over the telegraph wires to every paper in the United States.

This is a good omen, and we trust it may spread out in ever widening circles as the wavelets spread from a pebble dropped in a pool of water. Larger co-operation between business men of the city and business men of the farm will create confidence and esteem between these two groups that are so essential to each other but are too often separated by small antagonisms and misunderstandings.

We salute thee, Madison, first vessel to be christened with milk. May you ever succeed in your service to man, and may you wax strong and valiant as the child that consumes much of the precious liquid with which you were baptized.

SCIENCE A FRIEND

Science is a wonderful servant of mankind. Not infrequently do people become concerned over the lack of some product which is essential to our welfare and wonder what the world will do when the supply of that product becomes exhausted.

Some persons are already wondering what the automobile will do when the gas supply is exhausted. Concern is expressed over the supply of certain materials for keeping the soils fertile. More than a third of a century ago we heard men express alarm over what the nation would do for building material, for at that time good timber was becoming more difficult to obtain.

Time has shown that we need be little concerned over the shortage of materials for the future. Something will be invented or discovered to take the place of gas when the oil supply of the earth has been exhausted. We already have several materials which take the place of lumber for many purposes. We are now informed that an important element of soil fertility can be obtained from coal.

Coal carries as high as 2 per cent of nitrogen. When it is distilled in a by-product coke oven or used in the manufacture of gas, the nitrogen combines with hydrogen, forming ammonia, a product that is exuded from horse manure. Every farm person has observed, when cleaning a horse stable, the strong odor which arises and at times brings tears to the eye. This is ammonia gas and carries nitrogen, an important element of fertility.

We have been laying plans in this country to take nitrogen direct from the air, for we have not considered it a sound business to depend upon Chile to supply us with nitrate, a product rich in nitrogen.

We now read that the next large development in the heating of homes in the cities will be to provide ways and means to use gas. Gas is made from coal and in the manufacture of gas, ammonia is created. We apprehend that the supply from this source will not be large in the immediate future. It does show, however, how science unfolds new things and makes it possible for us to go forward and develop new things to take the place of those that have become exhausted. Science is not only a good servant of humanity but a very friendly one and through it we have brought about our improved methods of living.

SNOW, BEAUTIFUL SNOW!

Shoveling water—how foolish! Yet that's just what we were doing, for every shovelful of snow that we threw up was just so much crystallized water.

"This is one job the farmer gets out of," said we to ourselves as we shoveled the sidewalk toward the end of a beautiful January snowstorm. The words had scarcely been uttered when we thought back a few years to one winter's day on the farm. Drifts were piled man high between the house and the chicken coop. It was our job to shovel a path so mother could feed her flock. We tried to pick a spot where there would be the least shoveling. At that, it was a long struggle.

From that scene our thoughts jumped to the present. Only two days before, while driving in the country to visit a farmer, we were shoveled out three times, thanks to shovels and some brawn supplied by nearby farmers.

The farmer doesn't have to shovel snow? We laughed as we continued our little job. And every shovelful of snow seemed to tell us how much good it was doing the world. "Why," it said, "we make a soft, warm blanket for Mother Earth. If it weren't for us the grass, the alfalfa, and the rye and winter wheat might get badly frozen out. What a shame that would be!

"And don't forget that we snowflakes are made of water. When we melt we sink down in Mother Earth, at least many of us do, there to help in the sprouting of seeds and the building of crops. Besides, don't you think we are very pretty to look at?"

We remember when we were in college a certain professor had a famous lantern slide lecture that he repeated once or twice a year to big crowds. His lecture was on "Snowflakes." Funny thing, this professor's name was Snow, too. More marvelous designs than were shown in every picture of a flake we never expect to see anywhere. Intricate, delicate—beyond description. Each snowflake alike, hexagonal or having six sides, yet every one different in design. Lacy in structure, perfect in form. Some time examine a few snowflakes as they fall on your sleeve. We may get tired of shoveling snow, but we are thankful for its beauty and we know that it is useful, too.

COD LIVER OIL AND SUNLIGHT

In the past few years scientists have discovered new information about feeding farm animals. They have also given reasons why we follow certain practices in the care and feeding of live stock. At present a number of investigations are being made to determine the importance of sunlight and its effect upon poultry. Comparisons are being made to determine the relative efficiency of sunlight and cod liver oil. It has been found that vitamin D is essential in keeping a flock in good health. The ultra-violet ray of the sun affects the growth and health of poultry, but it will not pass through window glass. A number of materials on the market permit light to pass through them and do not eliminate the violet ray as does ordinary window glass.

Some hold that if cod liver oil is fed, it is not necessary to permit chickens to bask in direct sunlight or to use materials which permit the ultra-violet rays of the sun to pass through them. There is much difference of opinion in reference to this and it is our belief, in view of our present knowledge, that it would be unwise to keep chickens away from sunlight, even though cod liver oil is fed. It is safer to expose poultry to as much direct sunlight as possible or to light coming through material which permits the ultra-violet ray to pass through, even though it is fed cod liver oil.

It should be remembered that not all cod liver oil contains vitamin D in sufficient quantity to prevent rickets, leg weakness, etc. Vitamin D is not the most stable product in the world and may be lost through oxidation. Care should be exercised in the purchase of cod liver oil. The safest and best way is to purchase it from a reliable company, one that has made laboratory tests of it and guarantees it to contain vitamin D.

While cod liver oil and ultra-violet rays are most important to healthy poultry, yet we should not make a mistake by assuming that these are the all important factors in providing feed and care for the flock. There still needs to be fed a good balanced ration, that is, feeds which supply them the necessary nutrients for growth and egg production. This requires a good mixture of grain and a good mash.

A CHALLENGE TO PURE-BREDS

Some comparisons of the production of grade and pure-bred cows presented in our January 25 issue by E. Parmalee Prentice of Massachusetts should cause breeders of pure-bred dairy cattle to ask themselves the question, "Whither are we bound?"

Mr. Prentice quoted tabulations by the U. S. Department of Agriculture of the cow testing association records of 12,830 pure-bred dairy cows and 34,031 grade cows representing all dairy breeds. The average yearly production of the pure-bred cows was 7,667 lbs. of milk containing 296 lbs. of fat, and for the grade cows it was 6,999 lbs. of milk containing 281 lbs. of fat.

In a similar way comparisons from the records of cows in Wisconsin's cow testing associations, covering the period 1921 to 1926, showed that 7,285 pure-bred cows averaged 7,677 lbs. of milk containing 291 lbs. of fat, and 26,669 grade cows averaged 7,004 lbs. of milk containing 290 lbs. of fat.

In a way this may not be entirely a fair comparison. We know the production of these grade cows is considerably above the average of all grade cows. We would like to assume that the production of the pure-bred cows is considerably below the average of all pure-breds. We have some reason to believe that the grades represent the best of grade herds but we have no assurance that the pure-bred herds represent the poorest of the pure-breds.

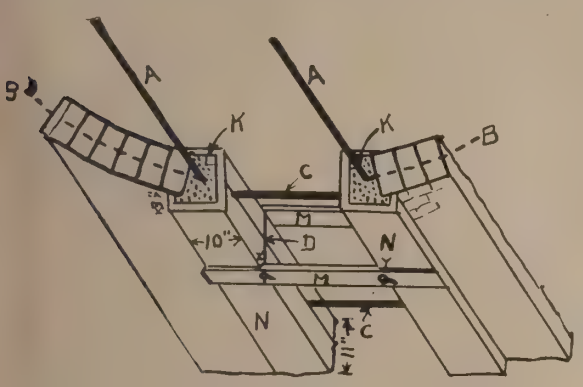
The figures presented are representative of the grade and pure-bred herds, the owners of which were persuaded and did adopt the cow testing association method of herd improvement. In this respect we are assured that the same influences that improved the production of grade herds likewise and to the same extent improved the pure-bred herds. By comparing the grades and pure-breds in this way we are able to arrive at the net benefits secured through the pure-breds by what is assumed to be their superior breeding. By so doing we find the utility difference to be surprisingly small, all of which prompts us to raise two questions as follows: Why is the difference so small between grade and pure-bred cattle? What are the breeders of pure-breds going to do about it?

The answer to the first question we believe is found in the fact that the owners of the good grade cattle have been improving their herds from both ends of their extremes in production. With the milk scales and the Babcock test they have been removing the scrub cows and also finding the ones that turn feeds into profit. These better cows have been mated to pure-bred bulls with the result that the herd average in many grade herds is closely approaching that of pure-bred herds. As compared with this method of herd improvement the owners of pure-breds have been working from only one end of the production extremes. They have used pure-bred bulls as they must to have their animals recorded; they have done some testing but

usually with a limited number of cows of the greatest promise. They have not sent many scrub pure-breds to the butcher.

The answer to the second question is to be found in some method of selective registration based in part at least on performance at the pail. The Holstein-Friesian Association of America is already working on this very thing and it unquestionably is but a matter of time before some form of selective registration will be adopted by all dairy cattle registry associations.

The handwriting is on the wall—it has been there for some time. The challenge made by these improved grade herds must be met. It will be met effectively when owners of pure-bred cattle put the yardstick of production on all the cows in their herds and refuse to record in the registry books such of these as have no possible chance of contributing more than a record of ancestral names to the future upbuilding of their respective breeds.



Building A Brick Silo

Please give me information as to how to build a brick silo.

Lindsay, La. M. D.

The reinforcement for the lower half of a brick silo 12 feet in diameter and 30 feet high is No. 9 wire for every two out of three mortar joints. For the upper half of the silo a number 9 wire for every third mortar joint will be sufficient. For a 12-feet diameter silo higher than 30 feet use a number 9 wire for each mortar joint below a point 30 feet from the top of the silo. The upper part of the wall may be reinforced as suggested above.

The reinforcement required for a 14-feet or 16-feet diameter silo is a number 9 wire in every third course for parts of the wall less than 12 feet from the top of the silo. For distances more than 14 feet and less than 22 feet from the top of the wall, use a No. 9 wire in every two courses out of

DETAIL OF CONCRETE DOOR FRAME FOR A BRICK SILO

three. For distances of more than 22 feet from the top of the wall use a No. 9 wire in every course.

The accompanying illustration shows the use of a form for the construction of concrete door jambs for a continuous door for a brick silo. N is built of boards and M of 2"x4" material. The form may be built about 8 feet long. M is notched so that the distance from X to Y will be 22½". These notches insure a uniform width of 24" between the finished jambs. Two or three pieces M will be required on both the inside and outside wall of the form. The holes for the ½" rod are bored at X and Y so as to prevent N from bulging. Three-fourths-inch holes are required in the forms to allow the ¾" ladder rod C to pass through and hook around the ⅝" rod A. The reinforcement 3 (number 9 wire) is also fastened to rod A. The form is ripped through the center of the holes, through which rods C pass, to allow it to be removed. A wooden strip at K forms the recess for the door.

When starting, the construction of the door jamb supports the rods A in their proper position. Place rods C through the form and hook them to rod A. Take up the slack in rods D and shift the form so that the lowest ladder rod (C) is level and about 1 foot from the bottom of the door opening. Tighten rods D and the form is ready to fill. To raise the form remove rods D which allows the form to be taken apart, cleaned, oiled, and assembled in its new position.

The silo door is quite generally built of two layers of 4-inch flooring with building paper between. There are inch projections at the sides of these doors so as to make the doors interlocking and allow a tight joint. A door fastener to hold the door to the ladder rods might be added although this is not absolutely necessary.

The interior is coated with cement mortar in order to make a satisfactory job. To make assurance doubly sure that the silo is air tight, whitewash the interior with cement and water mixed to a creamy consistency.

More complete information on the building of brick silos will be found in a bulletin issued by the Common Brick Manufacturers' Association of America.

Ropy Milk

We are having trouble with slime or ropy effect in our milk after it has aged a little. This occurs before the milk has clabbered. Last year about this time we had the same trouble and it lasted until April, at which time the slime disappeared and there came an awfully strong odor to the milk. The odor was similar to that of cow's urine in the early morning and the milk also had a similar flavor after it was milked and let it set for eight to ten hours. This could not be detected in the milk while it was fresh. The cream when separated from the milk was delicious while fresh, but after it set for eight to ten hours the odor would come to the cream and it also had the same flavor and made the cream almost unfit for whipping as it would flavor the desserts on which it was used until a person could hardly eat it. When the cream was churned into butter, the odor and flavor disappeared and there was no trace of either.

Georgia. W. B. B.

From the description given we are inclined to believe that the milk is infected with the bacteria that cause ropy milk. This is caused by a number of different kinds of bacteria and is frequently what is termed a mixed infection. It may not only cause ropiness, but also the bad odors in the milk.

This infection may come from the water in which the cans or milk utensils are washed; sometimes from the water in the cooling tank and sometimes from the bacteria which the cattle may pick up on their udders and bodies by wading through marshy ground or other wet places. Sometimes it may come from a stable infection, but this would be very unusual. About the only method to pursue is to exercise particular care that all milk utensils are thoroughly sterilized with boiling water and are then allowed to dry out thoroughly, either with artificial heat or by standing in the sun.

If this does not overcome the trouble, the next point of attack would be to see that the cooling tank is thoroughly cleaned out and preferably disinfected with a 12-ounce can of chloride of lime, or bleaching powder, to 100 gallons of water. As an additional precaution, all milk utensils might well be immersed in this solution. If neither of these treatments removes the trouble, then recourse should be had to keep all possible contamination away from the cows and out of the milk.

It may be possible that the water tank is the source of the infection, in which case it would be necessary to clean and disinfect this. The infection may come through the cows wading through wet places in the pasture, and the only proper procedure then is to restrict the cows from such areas. In addition, it would be well to see that the cows are thoroughly brushed off and possibly the udder and flanks washed in a disinfecting solution somewhat similar to that used for the milk cans. In all cases where the disinfecting solution is used, care will have to be exercised that it be properly rinsed off or time permitted for the odor to evaporate; otherwise, the milk will take up this odor.

It should be understood that the exposure to heat or to disinfectants leaves nothing on utensils which will prevent the growth of ropy milk organisms if they find their way to the utensils after such treatment. In actually carrying out such a disinfecting campaign at the farm, it occasionally happens that some pail, dipper, or other object which has been in contact with the ropy milk is overlooked. If, in connection with the handling of the milk, the germs on this one utensil spread to the others, the result of the disinfection is lost and the trouble will reappear in the milk. Fortunately, in handling actual outbreaks, the trouble rarely reappears where the work has been carefully done.

In locating where this trouble may originate, it might be well to take samples in bottles that have been thoroughly sterilized in boiling water, these samples to be taken at various stages in the handling process and allowing them to stand at the usual temperature. Hold the milk at the same temperature and under conditions similar to those under which the milk is now being handled, as changes which take place at one temperature may not occur at another. One sample should be taken directly from the udder, another from the pail as soon as milking is completed; another from the filled cans, and so on through each process in the handling of the milk. If the first sample does not develop ropiness while the second does, the pail should at once be suspected. If thorough sterilization of the pail does not overcome the trouble, then it may be possible that the infection comes from the air. Air contamination can generally be proven by boiling a sample of the milk and then exposing it to the stable air and holding it according to the accustomed conditions to see whether or not ropiness develops. If the surroundings are the cause of the ropiness, the stable must be cleaned up and properly disinfected.

Mineral Supplements

Give me some information on feeding minerals to milk cows and growing heifers. I am feeding all the corn silage the stock will clean up in addition to which they are allowed to pick over soy bean straw that does not contain any leaves.

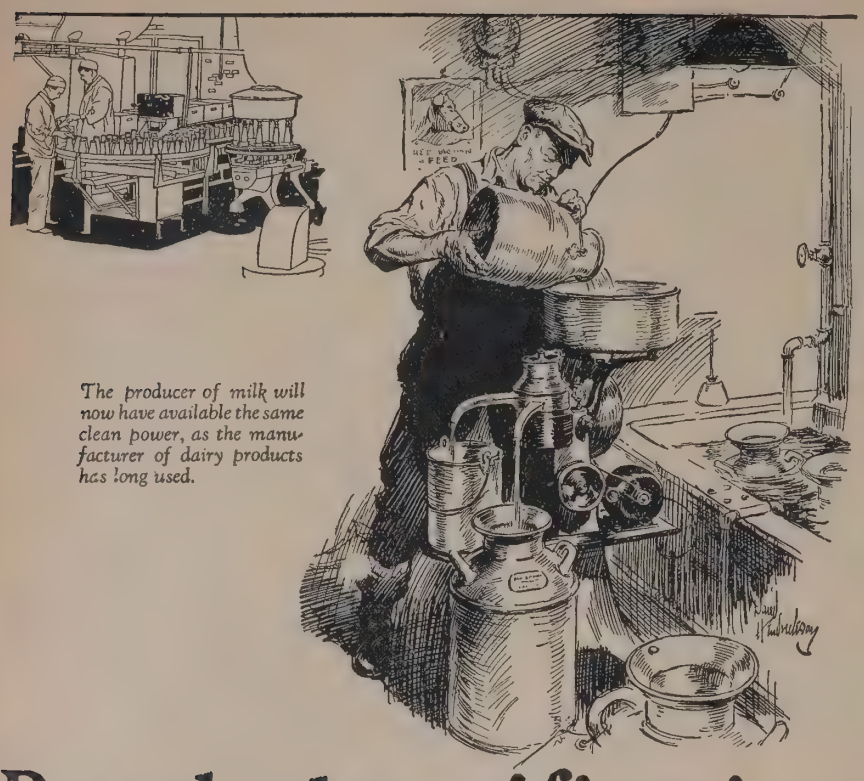
Reynolds, Ind. G. H. D.

The mineral requirements of dairy cattle are not fully understood. This applies particularly to the factors that influence the assimilation of mineral substance from the feed as it is converted into body and production uses. What mineral substances, how much of these, and how best to feed them, are questions that cannot be fully answered. They may be partially answered, however, so far as the needs of the average dairy herd are concerned.

The time of greatest need for mineral substance in the life of an animal is in the growing heifer and when cows are at peak production in their lactations.

Heifers will make normal growth if fed liberally of skimmilk together with legume hay and grain up to 6 to 9 months of age and thereafter fed legume hay, grain, and pasture.

The need for supplementing the rations of cows in milk with minerals depends on their capacities to produce milk, and on how they are fed and handled. It is thought that cows capable of producing up to about 300 lbs. of fat a year will be kept in normal condition under the following system of feeding and management: (1) They must be in good condition when they freshen; (2) The roughage of their rations must include liberal quantities of legume hay; (3) They must be fed according to production; (4) They must be given a rest or dry period of 6 to 8 weeks during which time they must be so fed as to bring them up to good condition again for the succeeding lactation.



The important things in this system of management are in the legume hay and the rest period. The former supplies liberal amounts of calcium during the production and the latter gives opportunity for the cow to regain any mineral depletion that may have occurred during production.

With higher producing cows the same system of feeding and management is advised in addition to which mineral supplement is included in the feeding. No one has been able to say definitely what is the best supplement to use and how it should be fed. It is known that mineral assimilation goes on at a greater degree with the aid of the vitamins found in green pasture grass and with direct sunshine than with dry rations in the absence of sunshine. In other words, there are conditions under which a cow is able to make greater retention of mineral supplements than under other conditions. In view of this fact it is important that minerals be supplied when they can be used to greatest advantage. In the light of present knowledge that time seems to be when cows are on green pasture in direct sunshine. Normally, in the dairy sections where the majority of cows freshen in the fall, this time occurs toward the close of their lactations and when they are dry. Being relieved of the need of minerals for milk production they are better enabled to rebuild the depletions of their bodies.

A safe practice, therefore, with the higher producing cows is to allow them free access to a simple mineral mixture the year around. Such a mixture could be made from equal parts of weight of salt, bone meal, and finely ground limestone.

In certain sections it is advisable to feed iodine to pregnant cows to prevent goiter in their calves. This may be accomplished by sprinkling on the feed each day one tablespoonful of a solution of one ounce potassium iodide to one gallon of water.

Corn silage and soy bean straw are poor feeds so far as their mineral content is concerned. In addition to the grain supplement the ration should be supplemented with the mineral mixture given above.

The producer of milk will now have available the same clean power, as the manufacturer of dairy products has long used.

Rural electrification
—a matter of business cooperation

ALL FARMERS want to enjoy the comforts and convenience of electricity. How to get it is the question still to be answered by most of them. Yet rural electrification is merely a problem of business cooperation.

Electric service cannot be sold to isolated or occasional customers, as merchandise can. For electricity — like milk — cannot be stored to any practical degree; it must be consumed as produced.

Thus the cost of building transmission and distribution lines, and of keeping a supply of power ready for instant use, can only be met by having on every mile of line a sufficient number of consumers whose needs for electricity are many and varied.

That is the principal condition which governs complete rural electrification.

Lines can be built where groups of farmers will use enough power to make the extension of service a practical business undertaking, just as maintaining a milk route requires customers, not widely scattered, who use a steady supply.

So, to get electricity for your farm, get together with your neighbors and make your light and power company a cooperative business proposition. Ask your power company for information and cooperation.

The Committee on Relation of Electricity to Agriculture is composed of economists and engineers representing the U. S. Depts. of Agriculture, Commerce and the Interior, Amer. Farm Bureau Federation, National Grange, Amer. Society of Agricultural Engineers, Individual Plant Manufacturers, General Federation of Women's Clubs, American Home Economics Ass'n., National Ass'n. of Farm Equipment Manufacturers, and the National Electric Light Association.

Grind With the "JAY BEE" HUMDINGER

Crusher - Grinder - Pulverizer

Increase Your Profits

Best and most economical grinding is done with the "Jay-Bee." Makes nutritious, palatable feeds. Eliminates costly feed losses.

Easy Payment Plan

See the Humdinger at work on your farm without cost to you. Prove to your own satisfaction it's the best, fastest, most economical mill made. 4 sizes—7 H.P. to 30 H.P. *Ask about our easy payment plan.*

Grinds Any Feed or Roughage to Any Degree of Fineness

Grinds any feed, dry, damp, wet or oily—to any fineness. Any roughage: hay—Kaffir corn—fodder—snapped corn, husks on—leaves no sharp edges to cause sore mouths as with buhr mills. No hulls in oats. No rats' nests in shock corn. No metal touches metal. No heat. No friction. No breakdowns. Always dependable. Biggest capacity. Lowest operating cost. *Unequalled* as grinder—feed saver—money maker. Free feeding booklet, literature, etc. Stock in principal cities.

If Your Dealer Does Not Handle Goods Advertised in Hoard's Dairyman — Ask Him Why!

New York Milk Committee

H. H. LYON, NEW YORK

THE committee of milk producers that is striving to propose an organization for the entire milk shed of the New York territory was again at work in late January. The Department of Farms and Markets has a mass of statistical information of great value. Commissioner Pyrke's paper was presented and much of value added by a discussion by Mr. Gillett in charge of statistics. Evenness of production was stressed a good bit.

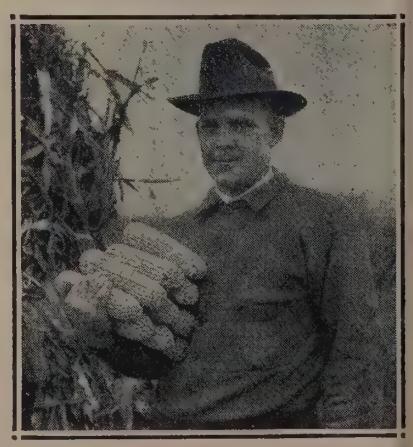
The manager of the Connecticut Milk Producers' Association, C. E. Hough, was one of the most interesting witnesses that have appeared. He has the details of his work right at hand. The association is especially successful, yet Mr. Hough appreciates fully the great difference between the conditions in his territory and ours in New York. There is a certain surplus of milk in Connecticut but it has no comparison with that of New York. They are not required to own plants nor to do any manufacturing. Nearly all of the Connecticut dairymen are members and they are not embarrassed by political influences or by newspaper propaganda. They have a classified selling plan and a separate pool for the various dealers. One pool he thinks is right but he carries out the plan voted by the members. Much has been done in Connecticut to stabilize production by exacting a penalty for production either above or below the estimate set by the producer, and such penalties revert to all producers.

The entire day was taken up with rather unusual information that, when ready for the public reading, will be worth study. Dr. Meyers, professor of marketing at Cornell, discussed different forms of co-operation and presented balance sheets from several of the better ones. The form of organization best to use depends upon several factors, one of which is the commodity. For New York, after some hesitation to consider his answer, he pronounced for a non-stock, non-profit association but thinks with a subsidiary having capital. The centralized plan is best for this territory, one reason being the unity of dealers to whom sales must be made. He, too, emphasized the formation of one sales or marketing organization for this territory. Not much can be done to improve the dairymen's economic condition until this is accomplished.

It remained for Mr. Van Cise of the Dairymen's League to present figures to show the trend of market demands. There is almost certain to be an increase in consumption of six thousand cans a day year by year, five thousand of this for the New York City market. There are about 101,500 dairies in the present New York milk shed. About half of these are inspected and approved for the New York city market. We are short of milk now along in November and for a little time. This shortage may be taken care of by inspecting some more dairies or by increasing our production about seven pounds per dairy for a short time, or it may be done by going outside our territory.

Mr. Van Cise went well into details respecting the duplication of plants, the high cost of handling caused thereby, and the difficulty of operating tank cars in this territory because of the small amount of milk handled in each plant. Twenty years ago we had plants handling over a hundred thousand pounds of milk a day. Now it is a pretty good one that has a quarter of that amount It is caused by the excess in the number of plants now operated. All of the extra cost comes out of the farmer.

Mr. Garlock of the Eastern States Association is still emphatic in his opinion that no one organization can be formed into which a majority of the producers will come. He therefore advocates smaller organizations and a conference board where representatives of these may meet for discussion and a better understanding. He thinks that this plan is the only one by which any organization may some time be formed.



Mr. Spooner, a former director in the Dairymen's League, would modify the plan proposed by Mr. Johnson. There are several changes, one being to limit operations to New York City alone rather than to include up-state cities. He would limit deductions still further, and would require buyers to pay direct to their producers after the pool price had been determined by the central organization. All of which goes to show that New York dairymen are not yet of one mind.

The calm, deliberate, concise statement of J. D. Miller before the committee proved most interesting and valuable. Only a centralized association is applicable to the New York milk shed for selling milk. A contract is necessary, not so much to keep the member in as to define rights and obligations. There should be a way provided for the member to withdraw. A conference board might have some value if there is to continue many small groups. He guardedly estimated the possible cost of financing a one-organization association for plants, etc. at between thirty and forty million dollars.

Mr. Fox, president of the Borden Company, added considerable information, giving without reserve to the committee statistics in detail relative to the cost of milk distribution. He believes evidently in farmer organizations but not with any idea of controlling prices for a high income. Such an organization, he thinks, can make many economies, especially in relation to plants and their operation.

From what I could learn, many of the milk dealers can be depended upon to help in developing a large farmer organization if it is gone about rightly. Perhaps there are others whose position might be the reverse.

This hearing has hardly established the likelihood of an early oganization of all dairymen in our association, but it has brought a vast fund of information together and formed a basis for future work that must be done.

Wm. G. Neukam of Indiana, who grew 129 bushels of corn per acre in the Indiana five-acre corn club which was the highest record in the state for the 1926 season. Mr. Neukam was crowned corn king at the meeting of the Indiana Corn Growers' Association at Purdue University.

The EMPIRE
Milking Machine

Shortens the time required for milking, makes milking easier and pleasanter, cuts milking costs far below what hand milking costs.

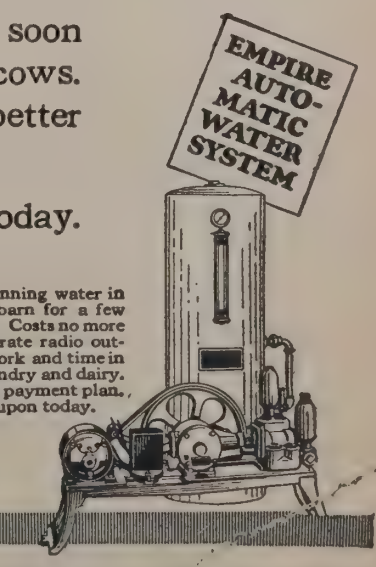
The calf-sucking action of the patented Empire Teat Cups makes cows give more milk per day for more days.

Empire Milking Machines are easy to operate, easy to keep clean, assure clean milk with low bacteria count.

The great EMPIRE MILKING MACHINE
makes Dairying a Better Business

The new B. B. Marvel Cream Separator—with its improved, permanently balanced bowl, automatically oiled ball bearing spindle, with no neck springs or bushings to wear out — will outwear any other separator and *get all the cream all the time.* Small down payment. Soon pays for itself by the extra cream you get. Mail coupon today.

IT saves the wages and keep of a hired man, because a man, woman or boy can do more milking with an Empire Milking Machine than any two hand milkers. It soon pays for itself by the extra milk you get from your cows. It fattens your bank balance and makes dairying a better business for you.



Sold on easy payment plan. Fill in and mail coupon today.

EMPIRE MILKING MACHINE CO.
97 Humboldt St. Rochester, N. Y., Dept. 1

Please send booklets checked and details of your easy payment plan. ☐ "How to Milk for Bigger Profits" ☐ "The Latest Development in Cream Separators" ☐ "The Empire Book of Better Water Systems".

Name.....

Address.....

Provides running water in house and barn for a few cents a day. Costs no more than a first rate radio outfit—saves work and time in kitchen, laundry and dairy. Sold on easy payment plan. Mail the coupon today.

Goodyear now announces a *new-type tread* for the balloon tire

Here you see displayed Goodyear's latest contribution to the American motorist—an improved new-type tread for the balloon tire.

As is apparent, it is a development of that most famous of all treads, the Goodyear All-Weather, now re-designed in the light of new balloon tire knowledge.

The first advantage to you of this new Goodyear tread is greater traction and non-skid efficiency.

This is achieved not only by placing the diamond-shaped All-Weather blocks in the tread's center, but also by flattening the profile of the tire to insure broader road contact.

The second advantage to you is improved tread-wear, accomplished by the flat design, and by placing two circumferential ribs in the tread at the points of greatest wear.

The new All-Weather balloon tread wears evenly and smoothly without wavy spots or "pot holes," and at any given mileage shows less wear and less obliteration of the non-skid design than is the case with earlier types.

In addition to these important benefits, the new Goodyear tread makes for longer total tire mileage, for quiet and smooth running, and for an even better looking tire.

You will want this new tire for the same sensible reasons that for years have made "*more people ride on Goodyear Tires than on any other kind.*"

Goodyear Means Good Wear

Marketing Methods of a Creamery

JAMES V. MURRAY, CALIFORNIA

ALTHOUGH marketing butter under its own brands, the Challenge Butter and Cream Association, a co-operative enterprise which sells the production of twelve California creameries and five creameries located in other western states, is extending its service to retailers so as to assist them in the marketing of the association butter under the retailers' own labels.

Keeping its policies elastic, as far as tie-up with grocers and other butter dealers is concerned, this company, which broke into the San Francisco field with great success in September, 1925, and has been going strong in the city and surrounding communities ever since, does not insist upon dealers laying down under sets of rules devised by the association.

"Where possible," said O. J. Kennedy, manager of the San Francisco sales depot, "we like our products to be marketed under the Challenge or Modesto brands. But we recognize that many grocers, some of them large chain store operators, have a prestige of their own to keep up in business. And with bottlers, canners, and coffee roasters willing to market goods under private labels, we see no reason why we should not do likewise.

"In fact, we are giving dealers who want this arrangement a special service which enables them to obtain their cartons at a greatly reduced figure over that obtainable by themselves. Our own print of lithographed packs goes to twenty million at each printing, and if the dealers are willing to accept our basic colors, a green, red, and white carton, or the blue and gold design, with their own advertising and brand name as the changeable features, we are able to increase our print to such an extent that the cost of printing will be very small indeed.

"With most of the chain stores buying our butter, all throughout their territories of operation, we are getting a large number of printing orders from them alone, besides which other calls are coming in, from all the cities, from operators of the large single grocery stores.

"We give free window trimming to all who desire it, and do not hire amateur talent but put on the road experts from a professional window-display company. These make a thorough canvass of the field, putting in window and wall displays wherever desired. And not only do we give this service on our own brands, Challenge and Modesto, but we give it to those who market our butter under their own brand names.

"With many meat markets giving free toy balloons to customers for the sake of the children, we are assisting our grocers and other dealers by giving them toy balloons free for a period of 30 days. One balloon goes out with every pound of butter, and as most of the orders are for 60 pounds at least, we have the balloons packed in lots of 60 in pasteboard cartons for their protection.

"Dealers operating small delicatessens and groceries are often short of a pencil when our route man calls on them, delivers butter, and wants his receipt signed. They have mislaid their pencils, perhaps, but instead of having to hunt around for one, our route man gives them a Challenge pencil, he being supplied with a quantity of them for this purpose. And, in addition, our pencils are systematically distributed by our salesmen as a help in sales promotion.

"On service to dealers, in addition to the activities of our route men, we

RED ECHO JESSICA, VERMONT'S NEW WORLD'S CHAMPION IN CLASS BBB

ONE of the most remarkable series of Advanced Register records in the Guernsey breed has just been completed on Red Echo Jessica by Charles D. Macdonald of Vermont, her breeder and owner. Jessica is one of ten cows in the breed to make three Class Leader records, and the only one of the ten to occupy one of the highest places in three different classes at ages below five years. Her latest achievement is the winning of the world's championship in Class BBB, with a record of 10,355.9 pounds milk containing 579.9 pounds fat, milked twice daily for a period of ten months, during which time she carried a calf for 274 days. She holds sixth place in FF with 685.4 pounds fat and eighth place in DDD with 453.9 lbs. fat.

Her last two records were made on twice-a-day milking. Naturally, the time she was on test does not tell the whole story of her production, as she milked after the records were completed. The actual production was 1900 pounds fat in 37½ months, all immature, and she has had four good calves.—The American Guernsey Cattle Club.

have a route captain for each four trucks of our fleet. He supervises collections, the building up of the territory, sees that our route men call regularly and give the proper service, and acts as substitute for any driver who is off the job for any reason. In addition, the route captain is directly responsible for the condition and appearance of the automotive equipment under his charge. He heads in anywhere, and helps in any way possible to increase the efficiency of the route service to dealers.

"Where some butter concerns allow their truck men to deliver butter about as a coal dealer delivers a load of coal—dump it on the floor of the store and walk away without trying to help the dealer handle it—our route men have instructions to open the box in the store, go to the ice box, and load the butter into any vacant compartment. Dealers appreciate this to the extent that finally they leave the top shelf available for our butter.

"As an example of how this works out, one of our route men, opening up an ice box in the store of a new customer, found a place for the butter on the lower shelf in the refrigerator. He worked around on the proposition until, finally, he got the top shelf. And he is selling three times as much from this advantageous position in the ice box as was turned over when our butter was stored below, out of sight.

"To illustrate how we are getting along with the chain stores, of which we now have nine-tenths sewed up, all done in a period of seven months, here is a single order for 3,420 pounds, from one of the largest of them.

"We can attribute our great popularity, in this highly competitive field in San Francisco and the Bay cities, to standardized quality of our products, to elasticity of policy toward dealers, to helps given them to turn over their butter rapidly at a good profit, and to getting behind our retailers with extensive advertising of the right sort—the kind that appeals to the consumer.

"Altogether we feel that the future of Challenge and Modesto butters, whether sold under our labels or those of our customer friends, is particularly bright, and we owe the dealers in this section of the country a vote of thanks for giving us the opportunity to prove up to them."

Austrian Field Pea in the South

HOARD'S DAIRYMAN:—In the lower half of the cotton belt the Austrian field pea, sometimes called Canadian field pea, is sown in the fall and makes an excellent winter cover crop, an early pasture or early hay crop, or early manure crop.

The Coastal Plain Experiment Station, located at Tifton, Ga., has tried the Austrian field pea alongside of vetch and various clovers. The result is that the Austrian field pea is found to make more early growth than any of the other winter legumes and, consequently, gives larger returns as a green manure crop turned under in the spring.

In early 1924 the South was visited by an unusually severe cold spell. Under this test the Austrian field pea suffered severely, but it compared favorably with clovers and rye. It, however, did not equal hairy vetch for winter hardiness, though it did as well as some other vetches.

Pecan orchardists of South Georgia have seized upon the Austrian field pea as a means for legume green manuring without incurring insect damage to pecan nuts that accompanies the use of summer legumes like cowpeas.

Dairymen are looking upon the Austrian field pea with favor. A combination of oats and the Austrian field pea has given considerable spring grazing at the Tifton station. The peas stood grazing well, being able to renew growth rapidly and give a large amount of pasturage. The amount of grazing afforded by the pea exceeds any other crop for early spring. It enables the dairyman to begin heavy grazing earlier in the season than the pasture grasses permit.

As an early hay crop, it surpasses in yield any of the vetches, clovers, or cereals. Combined with oats or rye, the yield of hay is probably increased slightly.

As a green cover crop to be followed by a summer crop like cotton or corn, the Austrian field pea is excellent as a conditioner of the soil and as a source of nitrogen. Tests, however, show that neither Austrian field peas nor any of the legumes turned under in the spring are equal to supplying the summer crops with all the nitrogen they can use to advantage. There is always a serious trouble with cutworms to be confronted by cotton, corn, or other summer crops following the Austrian field pea or any other winter cover crop.

From the standpoint of the dairyman or farmer who is handling a few cows, the Austrian field pea appears to have its greatest value in early pasture or for early hay. For actual milk production the pasture will doubtless pay better than hay.

Georgia. C. A. WHITTLE.

DEPENDABLE

People buy Dodge Brothers Motor Car because its dependability has won and earned their unqualified confidence.

This confidence has been solidified, moreover, by a policy of fair and reasonable prices; a dealer organization of the highest integrity; and a national service system that insures accurate work at fair, predetermined cost.

150% MORE POWER
30% MORE SPEED!!

—for Your Ford Truck
or Passenger Car—

The MUNCIE
Gear Shift Transmission
for Ford Trucks,

$84.50

Passenger Car Model
(without reverse gear)
($74.50)

PUTTING a Muncie Transmission in your Ford is like putting in another engine. The Muncie, by making available *all* the power developed by the sturdy Ford engine, actually *more than doubles* the hauling power of a Ford truck or car. The Over Drive Model gives you 150% more power and 30% more speed. The Standard Model gives 200% more power for emergency pulls. And the extreme flexibility of seven forward speeds and five reverse speeds.

With a Muncie Transmission in your Ford truck you can haul two-ton loads over the hardest roads—do it in less time and on less gas and oil than you now require for one-ton loads.

The Muncie is cutting operating costs and increasing earnings for Ford owners in all parts of the country and in all kinds of work. It is sold on a positive money-back guarantee. Ask your Ford dealer—or write direct for descriptive literature.

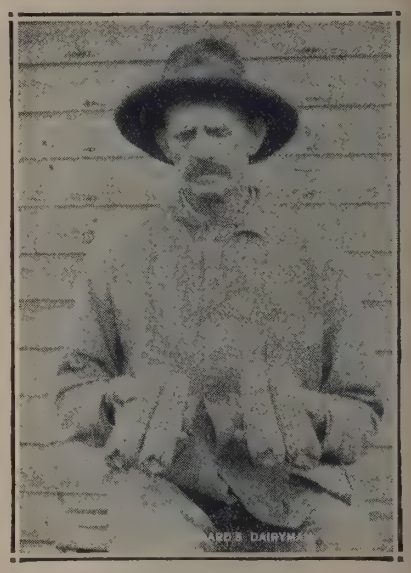
Jerseys and Corn Bring Success

H. H. BIGGAR, NEBRASKA

WHENEVER I hear a tribute to a man expressed by his son, I know at once that there has been cordial cooperation in the family and that the father's judgment and his efforts have been appreciated. For that reason it was with more than ordinary interest that I heard a farm boy say: "We've all been brought up on an 80-acre farm. A small farm most folks would call it, but all five of us children have been sent through high school. I think that dad has done mighty well."



The father of the son was Charles Grau of Douglas County, Nebraska. If you should ask folks in Nebraska if they know Charles Grau, the reply likely would be, "Oh, yes, he's that corn breeder." Others would add that he was a Jersey breeder. The fact is that Mr. Grau combines dairying with corn improvement and the two bring him the most of the revenue on the 80-acre farm. The breed selected has been the Jerseys as far as the dairy part is concerned, while Reid's Yellow Dent has been the corn variety with which Mr. Grau has been working.

It was eight years ago that Mr. Grau started with the Jerseys. He purchased ten at a public sale. When the first cow testing association was organized in his county, Mr. Grau joined and at the end of the first year it was discovered that some of the cows were not paying for their board. These were sold and the result of two years of membership in the association has fully convinced him of the value of getting the record of the cows via the Babcock test and milk scales route.

In handling the calves on the Grau farm the plan is to allow the bull calves to suckle the dams until they are two months old. Then they are sold for veal. The heifers are allowed to have one-half of their mother's milk at first, the amount being gradually decreased up to two months. By that time Mr. Grau has them on a full grain ration composed of equal parts of ground corn and oats. They also get a little oil meal and have access to salt at all times. The milking herd is fed ground corn and cob meal and wheat bran, equal parts by measure, and a half pound of oil meal daily per head.

The pasture for the Jerseys has been mainly sweet clover in recent years. There has not been such a thing as a permanent pasture on the farm for several years, frequent changes being made to keep up soil fertility. The fact that the Jerseys are lighter in weight than other dairy cattle is a point in their favor, says Mr. Grau, since they do not injure the pasture as much by tramping, especially in wet weather.

No man in the state has kept a closer tab on the latest work along corn improvement lines and endeavored to put the ideas learned into practice, than has Mr. Grau. Each winter at the state corn show held in connection with Farmers' Week at Lincoln, the corn is judged by Mr. Grau. He takes the task seriously and exhibitors know that when he makes a placing that he is ready to explain why he

FOUR GOOD EARS OF MR. GRAU'S SELECTION

does it. The corn judging room has afforded many helpful roundtable discussions in which Mr. Grau is always willing to give the benefit of his years of experience along corn growing and corn breeding lines. On the State Board of Agriculture he has charge of all farm crop exhibits and due to his consistent efforts, over a score of counties at the 1926 Nebraska State Fair had creditable collective exhibits.

Reid's Yellow Dent has been Mr. Grau's favorite variety. He has been growing strains of this variety for years. On his farm he has carried on experiments to determine the comparative yielding ability of smooth and rough ear types. In the first test of this kind, the smooth type made a yield of 86 bushels per acre and the rough type 71 bushels per acre.

But smooth corn to Mr. Grau does not mean corn that is excessively smooth. He prefers a medium smooth type to any other. There is danger, he believes, in striving for too much of smoothness for the reason that a flintiness tendency may develop. One of the things he has noted with regard to the smooth type of corn is that it has a larger percentage of marketable ears and a minimum of ears

CHAS. GRAU AND HIS JERSEYS

which are affected with dry rot and fungus diseases.

Careful selection of seed corn from the standing stalks before frost, is a yearly practice on the Grau farm. Further culling of undesirable ears before planting next spring is always followed out. From time to time trial plots of corn are grown with seed secured from other states or from other localities within Nebraska. Along this line, Mr. Grau's experience has been that his own corn usually is best the first year. However, yields and quality of other corn varieties from outside are improved by growing them for several years. Indiana and Eastern Iowa corn make a very poor showing the first year they are introduced but tend to show an adaptation if the seed is kept of each year's crop and planted.

"Keep up your soil fertility while you are improving your corn," is Mr. Grau's motto, for fertile soils are needed for corn culture. Alfalfa, sweet clover, and red clover are a legume trio that have been used with success and Mr. Grau feels that his soil is as fertile today as it was 43 years ago when he broke the first furrows.

Small Meetings Drive It Home

HOARD'S DAIRYMAN:—"Give every cow in the county a better chance by feeding a balanced ration," and "scrap the ones that fail to show a reasonable profit when they are properly fed," were the two messages driven home to the dairymen in Green Lake County, Wisconsin, in a three-day series of meetings held in every township in the county on December 8—10. And the messages were driven home for keeps. Every fourth man on Green Lake County farms got the story first hand, and it's a safe wager that the greater portion of the other three-fourths of the county's dairymen got the news later.

Three hundred fifty of the county's 1500 dairymen turned out at the 24 daytime sessions, and a total of 500 farmers attended the two dozen day meetings and the three evening programs. And, best of all, every man present took an active interest in the discussions.

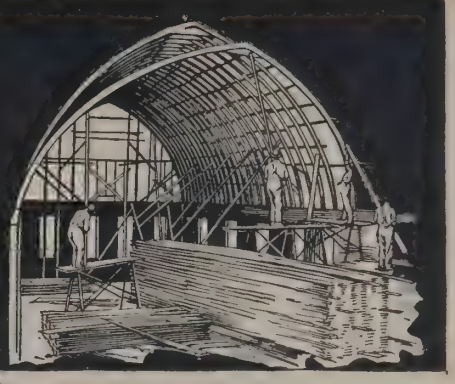
The meetings were unusual, not only from the standpoint of number, but were rather unique in location and in the informal manner in which they were conducted. Practically all of the two dozen day meetings were held on farms, generally in a dairy barn. Two or three of these get-togethers were held in every township. They were roundtable affairs, informal in every particular, and if any dairymen went away without getting the information that they desired it was because they were too bashful to ask questions in the presence of a few neighbors and friends.

Just prior to the meetings Professors Morrison and Humphrey, of the Wisconsin College of Agriculture, had prepared a list of dairy rations, consisting of farm grown feeds and the necessary protein supplements, and these rations were presented and discussed at every session. The costs of the feeds had been determined for purposes of comparison, and the necessity of having sufficient protein in the ration was thoroughly emphasized.

Ridding the herd of the non-profitable producers was advocated through cow testing association work, cow culling clubs, and for the pure-bred breeders through the adoption of the new Herd Improvement Plan. The names of prospective members of each of these plans were secured at all meetings, and follow-up work is now being done in the organization of this membership.

Eight men, L. L. Oldham, secretary of Wisconsin Holstein Ass'n.; A. O. Collentine, dairy cattle specialist from the Wisconsin College of Agriculture; J. L. Tormey from the American Shorthorn Breeders' Ass'n.; J. P. Riordan, in charge of the Farm Bureau Department of the Wisconsin Manufacturers' Ass'n.; R. T. Harris, in charge of Official Testing Work in Wisconsin; W. W. Clark, county agent supervisor; and A. J. Cramer and H. C. Searles of the Wisconsin Dairymen's Ass'n. composed the teams that conducted these feeding and testing schools. Two men, one live stock man and one on feeds and feeding, had charge of each meeting. Each team held two meetings per day. The average attendance was fifteen.

Results are coming. The Green Lake Cow Testing Association has reorganized for the third successive season. The Markesan Association will undoubtedly be operating again by February 1. Twelve men have signed for cow culling clubs. Pure-bred breeders are requesting Herd Improvement work. Feed dealers report a brisk demand for the protein supplement feeds. Requests are coming in continually for the ration sheets, and more dairymen are thinking, feeding, and testing than have ever done so before. Results are proving the success of the small, informal, specific farm meeting.



Wisconsin. JAMES LACEY.

A Good New York Guernsey Record

Elbert H. Gary of New York has recently completed a record on the Guernsey cow, Imp. Fleurie of the Glen, that makes her the world's champion in class CCC. Freshening as a junior four-year-old, she produced 11,377.1 pounds milk and 614.5 pounds fat in ten months, during which time she carried a calf for 225 days. Persistency has marked her production throughout the year, as she dropped only two pounds daily in milk yield during the first seven months.—The American Guernsey Cattle Club.

Our Free Book

TELLS WHY Jamesway COSTS LESS

and Saves Costly Mistakes

Labor Saving Dairy Barns

If you are thinking of building, remodeling or ventilating a cow or horse barn, hog or poultry house, or if you are considering the purchase of labor and time-saving equipment for such buildings, by all means, fill out coupon in this advertisement and let us send you free our valuable Jamesway book.

This book will show you how you can save money and have your buildings planned and equipped so that they are most convenient and practical. If you will avail yourself of Jamesway service, you'll have the same gratifying experience as H. L. Hartly, Manager of Island Farms, Duluth, Minn. Here's what he writes:

"We very much appreciate the splendid architectural service you have rendered us. The ability you showed to adapt plans to meet results desired were a revelation to me. Your suggestions saved me considerable in material and time."

Our many years' experience in planning and designing farm buildings enables us to save you money on materials and construction—show you how every door, window and general arrangement should be to make buildings convenient.

This book also tells you all about Jamesway Equipment—Stalls, Stanchions, Drinking Cups, Litter Carriers, etc., for the cow barn. Troughs, Waterers, etc., for hog houses. Feeders, Nests, Incubators, Brooders for the poultry house—a complete line of every kind of labor-saving, money-making equipment for any farm building. Jamesway Equipment is better and costs less in the long run.

Mail coupon today. Tell us just what you are interested in—whether building, remodeling, ventilating or equipping cow barn, horse barn, hog or poultry house, and we will send you the book that tells you just what you want to know.

INOCULATED LEGUMES PAY BIG!

GROW legumes—alfalfa, clovers, soys, vetch, peas and beans. They draw valuable nitrogen from the air and implant it in the soil. And for paying results—heavy crops, rich fertilization—inoculate your legumes with *Nitragin* the original soil inoculator.

Important: *Look for the Date When Buying*

All inoculators are perishable and *should be dated as to active life.* To protect you, your crop, labor and money, when inoculating, every package of *Nitragin* is dated for the year it is to be used. When you buy *Nitragin* you get fresh, vigorous inoculant and paying results. Look for the dated label and insist on *Nitragin, the established, original soil inoculator.* Prices:

Alfalfa, Clovers, Soys, Peas, Beans, Vetch—All Legumes

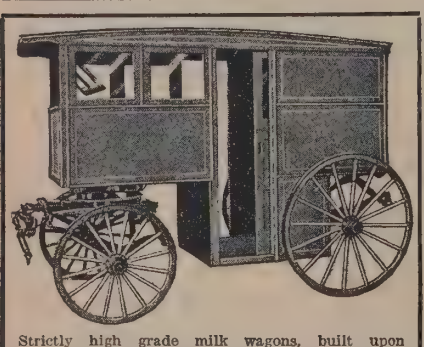
Service All the Way



An Advertisement of the American Telephone and Telegraph Company

It is impossible for a railroad train or a ship to call at the doorsteps of its passengers when they wish to take a journey. To take even a trolley or bus ride, one must go to some definite point where the conveyance stops. On the other hand, the telephone goes all the way to meet the public's convenience.

Each telephone call may be compared to a taxicab, whose destination is controlled by the subscriber. The telephone company extends its wires to the homes and offices of those who desire service, placing its telephones within immediate reach. The call is made at the time, from the point, and to the place that the subscriber desires. He speaks to the person he wants—wherever he may be.

At the disposal of each telephone subscriber are the talking channels of the entire Bell System. He may make a call a few or thousands of miles, and he may extend his voice to any point, to any person who has a telephone.

This is the essence of communication. Because of it, the number of telephones has increased in the last five years three times as fast as population. Because of it, the Bell System carries more than twenty billion messages in the course of a year.

Wayside Musings The Unseen Forces

JOSEPH S. MORRIS, WISCONSIN

THE unseen forces are the spiritual forces and it is these that bring us faith, hope, optimism. Some one has said that "youth is a blunder, manhood a struggle, and age a despair," but that was an exceedingly melancholy estimate.

There is a beautiful story in the Old Testament of the Bible. Elisha, the great prophet, is in a certain city and during the night his enemies, and the enemies of his people, surround the city. In the morning Elisha's attendant, a young man, goes out and views the army surrounding the city and it throws him into a state of despair. He cries out to Elisha, "Alas, my master! How shall we do?"

The young man had not had the experience of his master. He had not been through trial after trial; he had not been in difficult places again and again as had Elisha; he did not, seemingly, for a single moment believe that there were spiritual forces on his side. All he saw was an apparently overwhelming host over which he and his master had no chance of victory.

Elisha, the old prophet, prayed for this young man who could see only the difficulties and not the possibilities. What a prayer was that prayer of the prophet: "Lord, I pray thee, open his eyes, that he may see." And isn't that prayer just the prayer that needs to be offered for many of us?

How has it been in these recent years as problems have multiplied, and as, for many of us, it seemed as if we had reached the end of our resources. Panicky, we turned first in this and then in that direction looking for help. There were many loud voices shouting to us, telling us that they knew that we had been grievously misused, telling us to trust them and they would make everything right—by laws.

All the while there were careful men, men of experience, men of the type of mind that make painstaking investigation before advocating remedies, men who knew that to all of us there come times of difficulty, times of struggle, times of hard things. But we had no time for them. Their voices did not meet with a response from us. All they could do was to continue steadily on their course, knowing that ultimately sound sense and sound methods must prevail. These men have not and may never receive the commendation they deserve. They have, however, the satisfaction that comes to men who hold true to the saner and wiser ways.

One would imagine that people generally would be heart and soul with the men of balance and careful judgment. The fact is, that such men very often have to stand alone or at best with a respectable minority. In such a time of strain, and stress, and readjustment as that through which we have just passed, even those who know better often go with the crowd as a matter of self-preservation.

Happily, men and journals and leaders of sound judgment have, in most instances, weathered the storm and they stand today firmer, truer, wiser than ever. Their only support in days of trial was in the fact that, like Elisha of old, they could see the unseen forces of sound sense, sound economics, personal responsibility, and hard work, and while the younger men were either despairing or flying to false panaceas, they held true to their course, knowing that they and countless others before them had gone through such times of stress and strain, and that eventually sound methods and sound thinking must prevail.

Yes, "Open our eyes that we may see." And more than that pray for us that we may keep our eyes open take stock of our experiences, be more careful in our estimates and in our judgments.

There seems to be a false philosophy of life abroad that teaches that the thing to be greatly desired by all is that we may have more things to enjoy with ever less and less effort expended to obtain them. Those who are preaching this philosophy of life think that life will be happier, more complete, when we have removed every last necessity of struggling to obtain things.

Do we want every last bit of care and concern removed? Do we want every obstacle taken out of our path? Do we want the continuous sunshine of abundance with never a shadow to make us thoughtful? We certainly do not if we appreciate what it is that makes us strong men and women, men and women of character.

It seems to me that in all the discussions about the farmer's problem we have lost sight of one important consideration: Life in the open is the life that God ordained for man. Granted that there is physical health to begin with as an inheritance, hard work only serves to keep all the powers of mind and body and soul keen and healthy. Why envy the city man his white collar, his soft hands, his well dressed appearance?

Tremendous sums are being spent by people for this, that, and the other remedy or method by which they hope to obtain that which they realize they have lost—sound, vigorous health. There is only one way of having and keeping normally healthful life and that is by living much in the open.

If there is sound health, a good mind in a good body, and access to spiritual, inspirational, and pleasurable things, are we, after all, as poor as some would have us believe?

There isn't any reason in the world why the farm families of this nation shouldn't consider themselves as well off as any other class in the world. They will so consider themselves if they keep their minds on the real values. The world is not a place of chaos except as men's erratic thinking makes it so. There are certain eternal principles that prevail. There are unseen spiritual forces that are on the side of all wholesome-living, right-thinking, right-living people. Trouble comes when we begin to know more than the Almighty.

THE HIGHEST RECORD IMPORTED JERSEY COW, DAIRYLIKE MADCAP

At Merridale Farms, New York, the mature Jersey cow, Imp. Dairylike Madcap, recently completed an official production test in which she established a new high record for imported cows. In this 365-day test Madcap produced 960.72 lbs fat and 15,571 lbs. milk.

Dairylike Majesty, the sire of Dairylike Madcap, enjoys an enviable reputation as the sire of uniformly high-testing daughters. Over 100 of his daughters have been tested and they have averaged 540 lbs fat in 365-day tests.—The American Jersey Cattle Club.

Everything *for* Home and Family

The Stage Coach and the Pony Rider were the best means of communication through the big West when Montgomery Ward began business in 1872. Montgomery Ward & Co's. progress has been as great as the improvement in transportation. Yet the fundamental principles that Mr. Ward established in 1872 rule this business today: to always offer a saving on merchandise of honest quality, and to deal under a Golden Rule Guarantee. That has been our unbroken policy for 55 years.

PAPEC

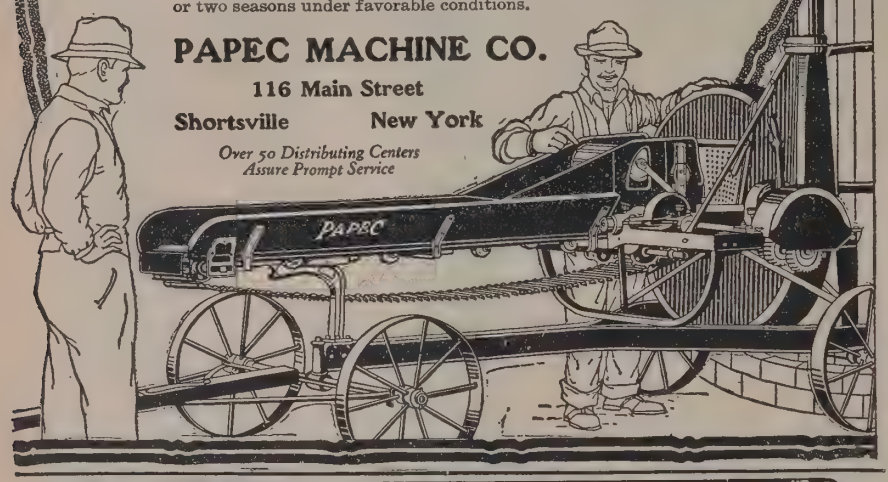
"The Cutter That Does Not Clog"

"THE Cutter never clogged and we had no trouble with it whatsoever," writes P. C. Petersen, Johnston, R. I., after two years' use of a Papec Cutter. The Feeding mechanism has been so perfected that a man is no longer needed at the feeding table, saving the wages of one man, and doing a better job.

Needs Less Power—Lasts Longer

Any good two-plow tractor will run a No. 81 or No. 127 Papec Cutter to capacity without danger of clogging. Where there is no tractor, the size "R" Papec can be used with any farm gasoline engine developing 3 h.p. or more. The Papec lasts a great many years with very little upkeep cost. J. B. Johnson, Southboro, Mass., bought his Papec Cutter in 1917, cut from 25 to 30 acres of corn every year, also lots of hay and straw for bedding and after eight years writes: "To date have not spent one cent for repairs."

Write for FREE Catalog



It shows why the Papec has won the praise of men who know machinery. It demonstrates that a Papec will pay for itself in one or two seasons under favorable conditions.

Getting the C. T. A. Idea Across

EARL N. SHULTZ, IOWA

DID you see our cow tester's exhibit at the fair?" Many farmers made this remark during the past fair season. Twenty-one exhibits were set up by Iowa cow testers in charge of cow testing associations. These exhibits were shown at the various local and county fairs throughout the state. Local material was featured in the exhibits.

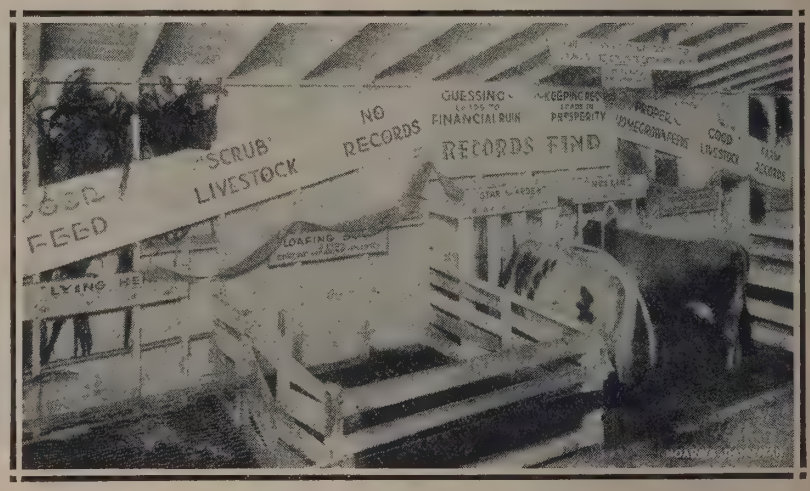
A dirty, unsanitary calf pen, a replica of the type found on many Iowa farms, was exhibited at the Clayton County Fair. In this pen was a thin, undersized, warty calf and a runty pig—partners sharing a wooden feed trough. Adjoining this pen was a well built, painted, clean pen in which was a growthy Jersey calf. The feeding vessel was a clean ten-quart pail setting in a manger in front of an inexpensive and practical calf stanchion. Over this exhibit were the signs: "The calves today, the cows tomorrow," "Good feeding, breeding, and management make the difference."

Cutting the cost of the feed bill by use of alfalfa as a roughage was shown in the Winnebago County exhibit. A cloth chart gave the requirements of a 1200-pound dairy cow producing 30 pounds of 3.5% milk per day. On each side of this chart was exhibited the exact amount of each feed in a ration filling the requirements. The only difference in the ration was that in one timothy was used as a roughage and in the other alfalfa was used. From this it was found that in the ration where timothy was used it required 3 pounds more of grain per day than in the ration where alfalfa was used.

The production of "Jersey" and "Goldie" was compared in an exhibit in Sac County. These two cows were from the same herd and were of similar type. A pyramid of butter tubs behind each cow represented the yearly butterfat production of each. "Jersey" produced 456.6 pounds and for "Goldie" 248.5 pounds.

Guessing contests were popular at several fairs. Two cows of similar type but with widely varying production records were used. Visitors were asked to write on cards their "guesses" as to the butterfat production of the two cows. A milk can, a cash prize, or other suitable prize was given to the winner. "I thought I could tell a milk cow but I guess I am all wrong," one farmer was heard to remark. These contests stimulated a great deal of interest and were highly educational.

Testers were on hand to answer any questions in regard to cow testing association work. The equipment, forms, and herd books used were available for inspection.



Two sets of panels were sent out by the Dairy Husbandry Extension Service of Iowa State College to supplement these exhibits. Each set consisted of six panels, four by four feet in size, on which was material especially related to cow testing association work. Each set was routed from fair to fair and kept in continuous use. Besides this educational value the panels added a touch of color and variety to the exhibit.

The Iowa cow testers and Dairy Husbandry Extension Service united in preparing a cow—sow—hen exhibit at the Dairy Cattle Congress held at Waterloo. This exhibit featured the value of a diversified live stock program and the value of farm records.

The value of cow testing association records was brought out by the comparison of two cows, "Nellie" and "Star Boarder." Nellie in the past three consecutive years produced a total of 26,622 pounds of milk and 1,508.2 pounds of butterfat, returning to her owner an income above feed cost of $468.84. "Star Boarder," on the other hand, represented the average Iowa cow with an annual production of 3,418 lbs. milk and 132.2 pounds of butterfat and an income above feed cost of $12.15.

That profitable pork production depends largely upon the number of pigs raised per litter was illustrated by two sows. One was raising a litter of nine, the other a litter of two. Figures showed that the average cost per pig in the first litter was about $2.22, while in the other litter the cost per pig was about $6.66.

Two pens of hens were shown comparing the production of 58 eggs by the average Iowa hen and the production of a record poultry flock. The latter flock in 10 months produced 16 eggs per hen, with an income above feed cost of $2.94 per hen.

IOWA COW TESTING ASSOCIATION EXHIBIT AT THE 1926 DAIRY CATTLE CONGRESS

Butter Consumption in Canada

The Canadian Department of Trade and Commerce reports that in 1925 the per capita consumption of butter of the 9,000,000 people in Canada was 27.36 lbs. This is based on a production of 169,000,000 lbs. of creamery butter and 100,000,000 lbs. of home-made butter, which was reduced to a total net consumption of 256,000,000 lbs. through the effect of international trade and storages.

Says Sam: Laughter, in one form or another, is the sauce that makes the food of life palatable.

Cows Vs. Cars

HOARD'S DAIRYMAN:—A registered Jersey heifer was won by William Shermully, a farmer's son, in a merchants' drawing contest at Marceline, Missouri. This is the first of a number of such prizes which will end with a grand prize of a Jersey bull to be presented to the farmers of the community at the final drawing staged by the Marceline merchants.

WM. SHERMULLY AND HIS HEIFER WON AT A MERCHANTS' DRAWING CONTEST

These merchants are to be congratulated upon their deviation from the established custom of giving automobiles in such contests. While the automobiles may bring some business to the filling stations or garages, the Jersey cow will bring business to every merchant, business man, railroad, and even the churches and schools of the town. This will encourage the development of the dairy business in the vicinity of Marceline with its exceptionally good pasture land and excellent shipping facilities as a division point on the Santa Fe Railroad.

Missouri. J. R. HALL.

Barley Versus Corn

HOARD'S DAIRYMAN:—I find that barley pays better than corn, even though I live in that great corn state of Iowa. However, to get these values I believe in sowing sweet clover with the barley. In this way I get a crop of barley, a legume pasture for hogs and cattle, and finally a cutting of clover hay. All this is secured from one planting with less labor and less expense.

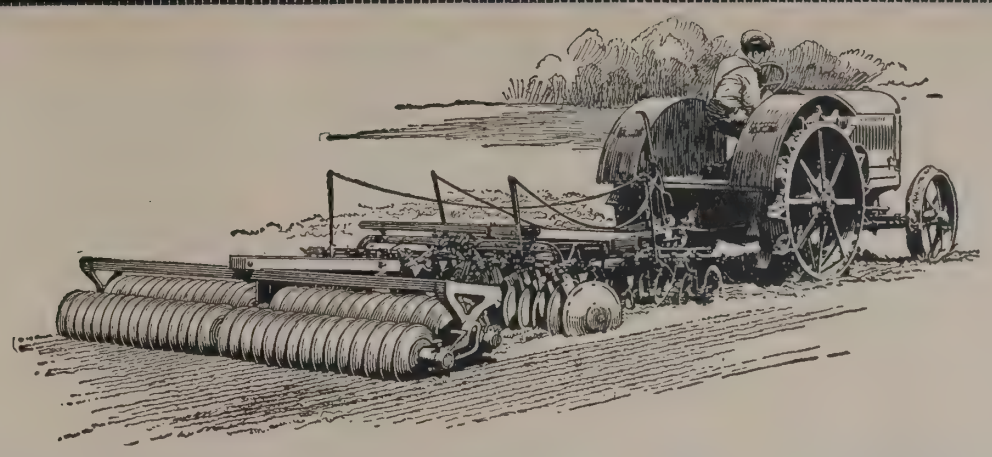
Last summer barley was selling side by side in price with corn and there are prospects of a greater demand next year. Barley is an excellent feed for cattle but, on account of its higher protein content, it is better for growing young hogs than corn. When fed with skimmilk, it makes an ideal ration for producing a high priced bacon hog.

Barley is a common feed for dairy cows in Northern Europe. The Danes sow barley and oats together. After harvest they grind these grains and claim it makes the best feed for cows and other stock. I find in bulletins published by the U. S. Department of Agriculture that barley fed with legume hay gives accordingly as good returns as corn in fattening steers and lambs.

I should like to have others give their opinion and experience on this question.

Iowa. HAWKEYE.

New England Holstein Meeting



The annual meeting of the New England Holstein-Friesian Association, held at Springfield, Mass., Dec. 21, was one of the best meetings ever held by the association. A large crowd of real Holstein enthusiasts was in attendance.

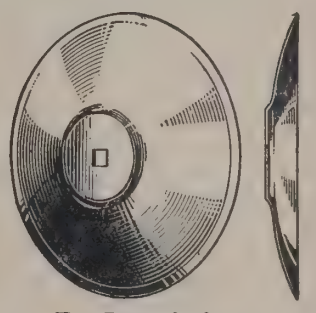
Plans were made for the entertainment of the National Association delegates that will be at the National meeting to be held in Springfield next June, and the committee in charge of the national sale reported that their work is well under way.

Hereafter the annual meeting of the New England Association will be held during the first half of November instead of the latter part of December. Professor Franklin N. Strickland of Rhode Island was elected secretary to succeed M. C. Peabody, resigned; Professor T. E. Elder, Massachusetts, was re-elected president; and Angus P. Thorne, Connecticut, treasurer. New England breeders are interested in an increase in official testing and with that end in view adopted the following resolution: Resolved, that since there is a real need to increase the number of A. R. O. cows throughout New England and the United States, the chair shall appoint a committee of at least five to study whether or not cow testing association records could be accepted as official and report ways and means of bringing this about.

Professor J. H. Frandsen of the Massachusetts Agricultural College and Allen N. Crissey, eastern representative of the Holstein-Friesian Association of America, spoke at the afternoon session.

RUTH WATSON, Recording Sec.

The NEW HEAT-TREATED DISKS *on* McCormick-Deering Disk Harrows *hold their edge in any soil*



THE Harvester Company has always put especially durable saw steel into McCormick-Deering disks and every user has benefited accordingly. Now, through careful experimentation the builders have learned to increase the efficiency of the disks *by a heat-treating process which toughens and tempers the steel.*

The new McCormick-Deering disks—heat-treated, crimped-center—are better able to stand the strains encountered in the faster tillage operations made possible by tractor power. They show special ability to hold a cutting edge, even when cutting and cultivating the hardest, rockiest soil.

The *disks* in the harrow take hard punishment! Glance at disk shown at the right. Note the *crimped center*—that means McCormick-Deering. The heat-treated, crimped-center disk in your harrow will mean fewer sharpenings, longer life, better work with less power.

Improve your tillage, lengthen the life of your equipment, put your 1927 crops into better seed beds at the right time—by relying on the thoroughly up-to-date and complete line of McCormick-Deering Tillage Implements. The line includes horse and tractor disk harrows, peg and spring tooth harrows, field and orchard cultivators, rotary hoes and the Dunham Culti-Packer. All sold by McCormick-Deering dealers.

INTERNATIONAL HARVESTER COMPANY
606 So. Michigan Ave. of America (*Incorporated*) Chicago, Ill.

***Be Sure it is a* Heat-Treated Crimped-Center Disk**

Look for the *Crimped-Center*—an *exclusive feature* on *McCormick-Deering Disks.* Over and above the toughening that is now given the disks by heat-treatment, the crimped center adds great durability. It adds 50 to 100 per cent to the strength at the center, and *you can get it only on McCormick-Deering Disk Harrows.*

* * *

You can take one of these new McCormick-Deering heat-treated disks and hurl it edgewise against a hard concrete floor without hurting the edge. You can put it in a vise and spring it out of shape with a large wrench—it will spring back into normal shape at once. *The disk that stands such treatment will stand abuse in the field.*

McCormick-Deering Tillage Tools

MILKS 18 to 40 COWS an HOUR

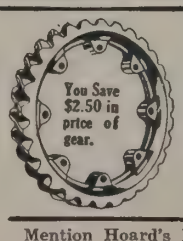
ONLY **$35** Puts it to work for you. Costs nothing to install

Ready to start soon as uncrated—Comes complete with 2 HP engine or electric motor. No extras to buy—No installation cost. Saves hours of work—equal to four milk hands.

Milks 2 to 4 cows at a time—clean—convenient. Milks just like the human hand—Easy on cows. 10 year guarantee. Used and endorsed by hundreds of dairymen and farmers.

Comes Complete—Ready to Use

"The Board of Health Inspector said my Ottawa was the first milker that he had ever run across that could be kept clean. I cannot say too much for the Ottawa." D. C. Cook, Route 4, Canovia, New York.



30 Days Trial —Try it on your own farm for 30 days. If you like it, keep it. If not, return it and your money will be refunded.

FREE Our book—"The Truth About Milkers" tells you all about it—illustrated—answers every question—Free—Let us send it to you. A Post Card will do.

Aunt Mollie Makes Cheese and Pin Money

GRACE LANGDON, WISCONSIN

"WHAT are you going to do with that funny thermometer and the little rake?" I asked Aunt Mollie wonderingly one afternoon as we were washing the dinner dishes.

"Oh, there's more to come," she said, as she lifted down from the cupboard several dozen little paraffined paper tubs and a package of gummed labels. "These are what I use in making my cottage cheese pin money.

"I just found out a new, quick way to make cottage cheese from the Agricultural College at Madison, so now I'm making it regularly every Friday and then have it ready to sell at Parker's store on Saturday. He sells a lot of it for me but I have to keep some over for your uncle and the boys because they like it so well, too.

"I'm paying for our new radio, you know, and this cottage cheese helps the hen money increase a lot faster. Your cousin, George, was at the Agricultural College last year and when he came home he said he could show me a faster and better way to make cottage cheese. He told me how and then went over to the creamery and bought me that thermometer and the other things."

In the morning Aunt Mollie had filled two large granite-wear kettles with fresh skimmilk—about four gallons in all. Then she had added nearly three quarts of what she called "starter," or recently soured milk from the pantry. Next she put in the floating thermometer, which George had brought from the creamery, heated the mixture to 100 degrees Fahrenheit, and kept it at about that temperature while getting sour.

When we had put away the dinner dishes, Aunt Mollie looked at the milk and saw that it was thick.

"I used to let the milk stand over night to thicken, and sometimes longer, before I made my cheese," she said, "but it didn't taste as good as it does when I make it all in one day, and it wouldn't stay fresh as long either."

Then she pushed the kettles of curdled milk forward on the stove and began to cut and stir the curd very gently with the little wooden rake. The temperature of the milk was about 100 degrees Fahrenheit now as she tested it with the thermometer again. Then after she had finished the cutting of the curd she put in her thermometer again and pushed the kettles over where the stove was hottest.

"I have to keep the heat just right now," she explained, "so that the curd won't heat any more than about one degree a minute." She kept on stirring the mixture gently and watching her thermometer closely. At the end of half an hour her thermometer read about 120 degrees. She kept it at this temperature until the curd pieces were firm enough to suit her.

She let the curd settle for a minute, after she took the kettles off the stove, and then tipped them over the sink to let as much whey drain off as she could. Then she poured in fresh cold water, stirred it in and drained it off. She did this several times and then took the temperature. It was 70 degrees or below when she finally dumped the cheese on a clean cloth to drain for about five minutes.

"I like to get it salted just right," she remarked, "because it spoils your cheese if you get too much or not enough. I've found that we like it best when I use around two and a half tablespoons of salt for twelve pounds of cheese."

When she had salted it to her satisfaction, Aunt Mollie packed her cheese firmly in the tub-shaped paraffin containers such as are used for cheese in many grocery stores.

"I bought 200 of these the last time I was in town," said Aunt Mollie, "and they cost me only three cents apiece. The gummed stickers I paste on were some we had left over from our honey jars."

The stickers were white with a prim little tree in the middle and quaint lettering, "The Pine Tree Farm," down the side.

Aunt Mollie then arranged her jars in neat rows in the storeroom ready to go to market early in the morning when Uncle George made his trip to the creamery.

A large bowl of cheese had been saved out for the family and Aunt Mollie promised to have some for supper.

"During the war we got to using a lot of cottage cheese," she explained, "and I used to see just how many ways I could fix it. We got some recipes from Washington in a little book and I liked some of those, too. I keep all my pet recipes in envelopes here in this drawer so if you want to look at some of them, you may."

I rummaged through my aunt's large envelope marked "cheese" and found all sorts of clippings and recipes written in her neat hand. Some of them were marked "good," so I knew she had tested them on her family, and others had changes made in quantities, indicating that she had adjusted them to suit the family tastes.

I copied a few that sounded especially good to me, in addition to the one for the delicious hashed brown potatoes that we had for supper that night. This is the way she prepared them:

Chop cold boiled potatoes fine and season well with salt, pepper, and onion juice. Put them on a hot frying pan greased with fat and cook the potatoes slowly without stirring until they are browned next the pan.

(Continued on next page)

AUNT MOLLIE TESTS THE CURD

STILL SELLING! ! !

The articles to embroider that we advertised for sale on the color page in our December 10th issue are still selling. These articles are very popular because every home really needs them. In buying them one saves both time and money as the material comes stamped and ready to embroider.

Some of the articles that will undoubtedly interest you are: Laundry bags (all ready to use and embroider) 59 cents each; tablespoon and teaspoon cases (ready for use and can be embroidered any time) 50 cents each; towels that add beauty to your kitchen and are also useful, 23 cents each.

We also have Misses aprons 50 cents each; aprons, 12-year-old size, all cut and made up, 75 cents each; luncheon sets 75 cents each; runners, 59 cents each.

We will fill your order promptly as we have these articles on hand and ready to mail.—Hoard's Dairyman Fashion Department, Fort Atkinson, Wisconsin.

Miscellaneous Fashions

No. 2949—Extremely Becoming Lines. The pattern cuts in sizes 18 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 3½ yards of 40-inch material with ⅜ yard of 32-inch contrasting.

No. 2010—Boys' Blouse. The pattern cuts in sizes 4, 6, 8, 10, and 12 years. Size 8 requires 1¾ yards of 36-inch material.

No. 2761—One-Piece Apron. The pattern cuts in one size only and requires 2⅜ yards of 27-inch contrasting.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Hoard's Dairyman patterns cost only 10 cents each. If you are buying any patterns it will save you money to buy from us. Fashion Magazine also only 10 cents.

Then soften cottage cheese with cream, mix it with a little chopped ham, and spread it over the potatoes. When the cheese is warm, fold over the potatoes like an omelet and serve on a hot platter.

A salad that Aunt Mollie made frequently in the winter was a mixture of cottage cheese and pickled beets. She cut the beets in cubes and used one cup of beets to two cups of cottage cheese. Mixed with salad dressing and served on a lettuce leaf, the family were always glad to see it coming.

One time when my aunt entertained the sewing circle she served cottage cheese club sandwiches and coffee. To make these she used three slices of toasted bread for each. The bottom part of the sandwich was filled with well seasoned cottage cheese and the top part was filled with crisp bacon, lettuce, and mayonnaise.

One Sunday morning for breakfast we had fried bread with cottage cheese. This was made by mixing cottage cheese with marmalade or jelly and then spreading it thickly on slices of stale bread. This was dipped in a mixture of egg and milk and fried quickly in butter.

Then, of course, when my aunt packed lunch boxes for the children she often gave them sandwiches of cottage cheese mixed with chopped nuts, celery, and raisins. Graham bread is especially good for these.

She made several delicious desserts, too, from cottage cheese. In addition to cheese cake she made a pudding that we always liked.

Cut 2 slices of stale bread in small pieces and put in a greased baking dish. Beat the yolks and whites of 2 eggs separately. Mix with the yolks 1 cup milk, 1 cup cottage cheese, ¼ teaspoon soda, ½ cup sugar, and ½ teaspoon salt. Add ½ teaspoon allspice and ¼ teaspoon mace and ¾ cup chopped raisins. Last of all, fold in the stiffly beaten whites of the eggs. Pour this mixture over the bread and bake in a moderate oven.

Style is not a matter of money. The woman who spends the most money on dress is not necessarily the best dressed. Very often her neighbor, with much less money to spend, will be more smartly clothed. It's largely a matter of taste.

In our Spring Fashion Magazine, we present a wide range of styles that are new, smart, and in good taste. For each one a pattern is offered and the designing is so clever that the styles are easily made.

In addition to afternoon and evening frocks, there are styles for wear around the house, also lingerie, children's clothes, embroidery, and some picture dressmaking lessons that are of interest to anyone who sews and of real help to the beginner.

Send 10 cents today for your copy of this book. Its style value is much greater than the price you pay and will be saved many times over on patterns. Address Fashion Dept., Hoard's Dairyman, Fort Atkinson, Wis.

Our Limited Sphere

"Oh, Helen, I wish I could do as much good as you do," I heard a farm woman say to a friend who lived in town. The friend had a car and was very generous in sharing it with others. One especially kind treat she had given to some one led to the remark which I heard. The farm woman could not drive a car and had but little time to give, although she did not realize that she did many other helpful things as worthy of praise as did her friend.

A short time ago I helped plan the report of our club on "Community Work." In compiling this report I thought, is the farm woman's sphere of usefulness limited, is she hindered in her desire to be of service to her fellowmen by being tied by the multitude of duties and cares that are her dowery?

Years ago I was admiring a beautiful piece of handwork at a county fair; it was a crocheted portiere. I exclaimed, "How exquisite, and think of the time and patience required in the making!" Some one near me said, "Yes, but I don't suppose whoever made that had anything else to do." The attendant in the booth said quickly, "You are entirely mistaken, the lady who made that is a very busy one," and she added as an afterthought, "You will find that it is the busy folks that usually do things." I have never forgotten that statement and twice within the past few weeks I have heard it again.

The Community Work report, when finished, read something like this: 14 garments made for the crippled children's hospital; 1 comforter made and also a case of canned fruits and vegetables; 7 days' labor given to Better Homes work; $6 worth of cakes and the time of two women donated for a district committee sale; $20 worth of home-made ice cream and cakes donated to church sales; several chickens given for charity; 35 calls on the sick, food and supplies being

COLT Light is practically sunlight. Its clear, brilliant flood of light cannot injure the eyes. The Colt Hot Plate takes all the drudgery out of cooking. The Colt Self-heating Iron makes ironing a comfortable task. These are the advantages that a Colt Light Plant brings to your family — advantages that add more to their comfort than any other improvement you could install.

The Colt Light Plant is *safe*, and the Colt Light Generator is listed as "standard" by the Underwriters' Laboratories, Inc. On the average farm, you refill the Colt Light Generator with Union Carbide* and change the water only three or four times a year. This generator is specially equipped to automatically give the user warning several times when the supply of carbide is nearly exhausted, allowing ample time to refill with Union Carbide.*

Colt Light fixtures add beauty to any home. They may be had in a wide variety of styles and types. A Colt Light Plant lasts for years and years, without expense for repairs.

Join the thousands of satisfield Colt Light users! Let us show you how easily and quickly you can install a Colt Light Plant in your home! Write today for our free descriptive booklets.

AMERICAN RADIATOR COMPANY 816 S. Michigan Chicago, Illinois

Ideal Vecto HEATER

taken as needed. These were some of the things done by the seven members as a club.

The list of individual members could have been as long or longer. For instance, one day one woman called her neighbor and said, "Say, do you know that Baldwins are having a sale on small sized shoes. One table is priced at ten cents, another at twenty-five. I thought you might be able to use them. She could and did buy two good pairs of shoes for 35 cents that would have ordinarily cost her $5—a good turn, don't you think?

Often we are told, "Come, get some tomatoes, or apples, or bulbs, or slips, or patterns, or books" from various of our farm neighbors. Isn't all that helping our fellowmen?

One shut-in farm woman does more good from her home than any town woman whom I know. One year a new neighbor of hers, whom she had never seen, was surprised on Thanksgiving morning with a great big basket holding a complete dinner and with a friendly note tucked in. The dinner was appreciated by the busy mother but the note and the friendliness of the act warmed her heart and has never been forgotten. This same lady has a wonderful old fashioned flower garden, her delight and the delight of the many people who receive her bouquets, seeds, bulbs, and slips, for she seems to have it and tend it only to share it with others. She is only doing her bit and though frail as she is it is a mighty big bit.

In thinking on this subject two other farm women come to my mind, both childless, each with a car of her own, but they never have time to take part in any community work at all. So it seems to me it all comes down to this, the limit of our sphere of usefulness lies in our own hearts. If we have the love in our hearts we will find ways of showing it. We will give and share that which we have cheerfully and willingly. You know it is far easier to say we would love to give a thousand dollars to some one than to keep their babies for a day or two or to go without that new hat to send them a bag of flour. The opportunity is not given to many of us to make great gifts, but none of us are deprived of the privilege of writing a cheery letter or passing on our magazines, loaning our books, or encouraging our neighbor by saying, "I admire your grit; stick to your job you will win out."

No, we are not limited because we are farm women, but because we fail to realize the importance of the little deeds and let opportunity slip away from us while waiting for the big chance that rarely ever comes.—GRACE GORDON.

2924—Exceedingly Smart. Cuts in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 4⅜ yards 40-inch material.

Mending Wooden Tub—Drop Cookies

To mend a wooden tub so that i will not leak around the seam, I ap plied a coat of parawax, then a coa of melted soap, and allowed it to dry The tub has not leaked since. I wa anxious to mend it as I used a littl Busy Bee washer in it and without th tub I could not use the washer.

Why roll out cookies when th dropped ones are just as good, if no better. It takes less flour and les labor. Put flour enough into any goo cookie receipt to have them form nic shaped cookies when dropped fro spoon.

When making oatmeal cookies fro the various receipts that are to b had, grind oatmeal and raisin through food grinder and note th difference.—(MRS.) EDNA BALFOUR.

Making the School Ground Attractive

I recently heard an address on th subject of making the school groun attractive and I thought it very fittin for rural communities.

A child surrounded by pleasan things is happy. How can unpleasan things be remedied? Get trees whic furnish windbreaks and shade. Clea up the yard and cut the weeds. Ge shrubs from your native woods. Jus a word of caution here. Do not g into the interior of the woods afte them as they will be too delicate.

Be sure to plant fruit and nut tree with your shade trees as the childre will enjoy the fruit and nut meat later. Hollyhocks, golden glow, an iris are very hardy after once started also wild roses. Twin sisters, othe wise known as honeysuckles, may b gotten along the roadside. A thor apple and wild crab form a beautifu snow of blossoms in the spring. Po lars will be very ornamental an sumac and elder bush very appropri ate for late summer and early fall.

The pleasing part of this is, that n money is required to put it across Nothing but time and that will be pleasure.—MAYBELLE FRUIT.

Wants Hand Lotion

I would be very glad if some or who knows of a lotion to soften roug hands would have it published.—(MRS.) J. T. CUMMINGS.

Husband: Have you much shoppin to do to-day?

Wife: I don't know. How muc money have you got?—Good Hard ware.

This

answers the question

"What about getting a milking machine?"

You can't tell how fast a horse can trot by judging the speed of a cow. And you can't tell what a milking machine can do for you *until you use the Hinman.*

Success for 19 Years Straight

There's no question about what *this* machine can do. It *has been* a success on thousands of dairies, *for 19 years straight.* Why? *Dependable. Simple.* Only 2 moving parts. No complicated mechanism to get out of order. Valve chamber *guaranteed for life of machine* and easy to clean as a tumbler. Shortest hose.

Gentle application of vacuum and *complete* release after every suction. Soothing—cows like it. Many prize cows milked with it—made their winning records—including the champion cow of England.

MILK STOOL PHILOSOPHY

J. J. SPRENGER, MINNESOTA

IT is not at all likely that a common farmer, spending a large part of his time working with cows and doing some good hard thinking on his milk stool, will ever make a great speech, but it is a common occurrence for him to have a feeling akin to eloquence come over him when he is thus thinking and in spite of his inability to express himself, his soul is quickened and his outlook on life is improved. It is at such times that we like to meditate upon some striking expression.

It is one of these expressions that has been uppermost in my mind during the last few milking periods: "Business is business." The reason this theme suggested itself to me is because a farmer friend of mine took issue with me when I told him that I believe that our real satisfaction from farming should come from the knowledge that we have honestly done our bit to increase the world's goods that minister to life and happiness and that the money we receive for our work should be secondary. To this idea he replied very emphatically that business is business on the farm as well as in town and if by growing less we can make them pay us more for our goods that that would be good business. He went on to say that if he could only convince the farmers to grow less and they would really do that, he then could grow a bumper crop and make some real money. And then he looked me square in the eye and said, "There are some things which are idealistic and some things that are business, but it's business that pays!"

Well, that was too deep for me. I could not help but think of another friend with whom I had been talking. He is a doctor and he had been telling me of the progress in his profession, "Why," he said, "when I began to practice thirty-five years ago, typhoid fever, diphtheria, scarlet fever, and other contagious diseases caused death after death but now they are made comparatively harmless." And as he spoke his kindly eyes shone with joy at the thought!

But I was thinking of my farmer friend so I asked him if he did not think it was poor business to work himself out of a job in that way, helping people to remain well. I said, "If everybody else thinks it good business to make his job last, wouldn't it be better for you to let a few cases of contagion spread a little so as to make your job last, too; because, you see, business is business?"

My doctor friend would have no more of this. He couldn't stand this kind of logic any longer and ended the discussion with this remark: "Business is not business in the sense you are now using the term, but real business is service."

That was the best pill I have ever taken and when it got to working I came to realize fully that one of the greatest changes during my lifetime affecting our relations with each other is the change we see in business as we have come up from the time when we believed in the principle of "let the purchaser beware" to the point where we believe that business is service. This is one of the changes for better that did not originate in the country but rather in the professions, followed by organized business until it has permeated our entire national life, realizing we are not here because this world owes us a living but because we owe this world a life.

This is a wonderful world to live in;
To lend and to spend and to give in;
But to borrow and beg and to get a man's own
Makes it the very worst world that ever was known.

Cost of Distributing Milk

During the year 1924 the New York College of Agriculture made a survey of the costs of delivering milk in Binghamton by 32 milk dealers in that city. Seventeen of these dealers delivered raw milk and 15 delivered pasteurized milk. The differences in costs per quart milk are shown in the following table:

Item	Ave. cost per quart, cents Raw	Pasteurized
Number of dealers	17	15

Interest on capital	.22	.26
Miscellaneous expense	.06	.33
Total	5.24	5.55

The average cost per quart indicates that there is little difference between dealers selling raw milk and those selling pasteurized milk because the latter handle a much larger volume of milk. It is noticeable that the dealers of pasteurized milk have a smaller cost in the item of delivery, but this is offset by the greater cost of office and management, repairs, etc.

A study was also made as to the relative costs when divided upon the basis of the annual amount of business done by each dealer. For 11 dealers that handle less than 100,000 quarts yearly, the average cost per quart was 7.03 cents. For 16 dealers handling 100,000 to 600,000 quarts, the average cost was 4.40 cents. For the five dealers handling over 600,000 quarts, the average cost was 5.08 cents per quart.

By reference to the table, it will be noted that these are costs of delivery and handling, and do not include the cost of the milk itself.

C. L. A. Whitney of New York is the breeder and owner of Wyebrook Supreme Sunshine, that becomes the fourth highest producing Guernsey in class G (junior two-year-old), with a record of 15,151.7 pounds milk containing 797.8 pounds fat. She is the fifth daughter of her sire, Weyebrook Supreme 158407, to qualify for the Advanced Register.—The American Guernsey Cattle Club.

GOOD SEEDS

Grown From Selected Stock—None Better—57 years selling good seeds to satisfied customers. Prices reasonable. Extra packages free with all orders. Large catalog free. 700 illustrations of vegetables and flowers. Send for it today. Dept. No. 36.

R. H. SHUMWAY, Rockford, Ill.

SALZER'S SEED BOOK & Planting Guide FREE

138 pages of helpful information on all varieties of vegetables and flowers. Gives low prices. Tells about interesting CASH PRIZE growing-contests for Salzer customers. Buy something from this advertisement or simply write for big free catalog containing full particulars of new WONDER TOMATO and how to get prizes for biggest tomato grown.

59 YEARS' SERVICE

The third generation of seedsmen is now serving seed buyers under the name of JOHN A. SALZER SEED COMPANY. 59 years of quality seeds and service stand back of every packet of Salzer's Seeds. Over 850,000 catalogs sent to customers each year.

Why not try Salzer northern grown, highest quality seeds and get bigger yields from same work and cultivation? A trial will convince you. Now—send for Salzer's FREE 1927 CATALOG and low prices, new varieties and many big specials.

10¢ Special advertising offer:—20 ft. rows of Sweet Peas, Pansies, Asters or Nasturtiums, 10c each. Any three, or 60 feet of flowers for 25c.

John A. Salzer Seed Company Box 284 LaCrosse, Wis.

25¢ Complete Garden 25c—10 packets, most popular vegetable seeds—radish, lettuce, tomato, beets, etc. Easily worth $1. All sent for 25c as special advertising bargain.

$25 PRIZE For The Largest Tomato Grown. Write.

Reduce your feed bills

FEED your cattle Sutton's Pedigree Mangels and your dairy herd will respond with a greatly increased milk production. These famous mangels are the biggest crop producers known. An Ohio dairyman says: "Last year I planted 2 lbs. of Sutton's Pedigree Seed and harvested over 19 tons of beets. I have never had cows produce as much milk on such an economical ration as they are this year with beets in the ration."

Sutton's Pedigree Mangel Seed is selected seed, grown from parent stock that has behind it the care and experience of 70 years of Sutton experience. Send for illustrated catalog. It contains cultural directions and data on cattle feeding.

BETTER BARN EQUIPMENT FOR LESS MONEY

Begin Raising Two-Ton Litters

Read this statement as received from A. T. Sanders, Lancaster, Ky.

"You have read in leading papers of our World's Record two-ton litter of 12 pigs weighing 4323 pounds in 180 days, produced on our farms and fed on Letz-Dixie mixed feed. We now have 300 Big Type Poland Chinas being fed according to the "Letz System of Home-Crop Feeding."

Write today for your copy of "The Feeder's Own Book of Facts," and read how 40,000 Letz-Dixie users have proved this simple feeding method yields two to four times the average pork, dairy or beef profit.

Letz Mfg. Company, 222 East Road, Crown Point, Ind.

LETZ-DIXIE MIXED FEED MAKER

What Thousands of Farmers Say the Letz-Dixie Will Do For You

1 Will increase animal production 15% to 30%.
2 Will require only 50% to 75% as much feed crops.
3 Will save 25% of your present labor cost.
4 Will release 25% to 50% more acreage for cash crops.
5 Will improve pork quality, increase the quantity, and shorten the period of pork production.

Blue Streak "New Method" FARM MILL
CUTS-GRINDS-PULVERIZES
TRADE MARK

Operates with Fordson or equal power. Grinds all grain and roughage. Runs at about half the speed of others. Grinds faster and finer. No screens—no burrs—no gears—no friction—no heating. Even nails and wire won't damage. Easy to operate. Catalog Folder Free.

Does It Pay to Feed

HOARD'S DAIRYMAN:—"It doesn't pay to feed cows when feed is scarce and prices are high." "It doesn't pay to keep cows when alfalfa hay is $24 a ton—no cow in the world will pay for it." These statements have all come to my ears during the past few days and prompted me to look into the records of some of our good feeders. As a result, the question in my mind is, "Does it pay to keep cows and feed only enough for existence? Why doesn't it pay to feed more than a maintenance ration? Give the cows a chance and then if they fail to pay their way buy them a ticket to the nearest market. With butterfat over 60c a pound, a cow certainly should pay her board.

As an illustration of what feeding does I would call attention to a record in the Long Prairie Association of Minnesota. This cow had been tested three years. Her best record made in 212 days was 196 lbs. fat with a profit above feed cost of $55.62 at a time when feed prices were low. She has been fed a balanced ration since freshening last time and in 72 days she has produced 155 lbs. fat and shows a profit above feed cost of $63.50, despite high priced feed and alfalfa hay at $24 a ton.

A balanced ration transferred this cow to a producer and she has made a greater profit in 72 days than she did in 212 days when underfed. She will undoubtedly be one of the high cows in the association for 1927. Her response to a balanced ration is an answer to skeptics of scientific feeding and answers the question, "Does it pay to feed when feed is high."

B. J. ROSENQUIST, Tester.

A Couple of Reminders

HOARD'S DAIRYMAN:—To have hot water night and morning is easy if you have a gas engine that gets warm while operating. A member of the

†Retest rules followed. *Includes dry cows.

Poynette Association of Wisconsin uses water for cooling his engine and when needed it is always boiling hot. This is fine for rinsing the milking machine, pails, etc. A cold water faucet is set right over the engine for refilling tank.

When one man is cranking the separator it is inconvenient to stop and empty more milk into supply tank. A member has a simple way of doing this without having to drop the separator handle. He hangs a chain or hook about 6 inches above tank. On this he hangs his shotgun can or pail containing new milk. It is a simple matter to tilt this can into the tank with the left hand, and replace another full one with the same hand. Cans can be lined up within easy reach. W. E. CONSTABLE, Tester.

Indiana cow testers from all over the state in annual convention at Purdue University during the Agricultural conference to discuss accomplishments of the past year and work out plans for future developments.

High Protein Ration

HOARD'S DAIRYMAN:—One member of the Denmark Association of Wisconsin was feeding a grain ration containing 12.5 per cent digestible protein with corn silage and good alfalfa and clover hay. He changed the grain ration so that it contained 14.3 per cent protein. One cow had been milking 53 to 54 lbs. of milk daily. After raising the protein content of the grain ration this cow gained on the average six pounds of milk daily. The remaining fresh cows, producing between 38 and 45 lbs. of milk daily, gained from 2 to 4 lbs.

This year cottonseed meal is very low in price compared with other protein rich feeds, but was never before available to members for balancing their rations. Being interested in securing the most economical production for each member, I urged the local feed dealer to get a carload of this feed. This was done and as a result each member will save from ten to thirty-five dollars on purchased feeds. M. H. NELSON, Tester.

Low Protein Ration

HOARD'S DAIRYMAN:—For maintaining high production it is not necessary to feed excessive amounts of high protein feed. The man who had high cow for the last two months in the Washington Association of Michigan fed a ration that contains only 10.8 per cent digestible protein. This cow gave 70 lbs. fat last month and 72 lbs. this month. The owner is quite punctual in his milking and feeding, and this counts more than "high pressure" feeding.

Another man had an experience that proves that it pays to produce a better quality of milk than just good enough to get by. He sells grade A milk to a hospital and recently received a letter from the doctor in charge stating that in 22 years he had never received better milk and asking for more milk.

C. M. WAGNER, Tester.

Tank Heaters Installed

HOARD'S DAIRYMAN:—Five members of the Lawrence County Association of Missouri installed tank heaters during the month of December. The chief advantage of warming the water in an outside tank is to insure that the cow will drink a sufficient amount. A heavy producing cow requires from 70 to 150 lbs. of water daily and will not consume a sufficient amount if near freezing point.

A cow producing 40 lbs. of milk daily and watered twice a day means she would have to take about 60 lbs. of ice water into her stomach each time. This amount of ice water is bound to be detrimental to digestion and the secretion of milk.

These members report they are getting results from using tank heaters.

"Bossie Say Thank You"

Why shouldn't she be thankful?

Not a chance of being crowded or trampled. Her smooth, one-piece stall arch has no cracks, crevices or dark corners where filth and disease may hide. *Pure air and light reach every spot around her.* She lies down, gets up, turns around to lick or look behind as easy as in the pasture. Her stanchion adjuster keeps her lined up at the gutter; she lies down in comfort and not in filth and misery. She keeps clean.

Fresh air to breath; a fresh drink when she wants it—even at night; never nervous, tired or sick. She looks well, feels well and does well. Every day she deposits in the milk pail her thanks for this comfort of a barn that's right.

If your barn isn't right now you can make it right. We'll help you.

World's Greatest Advance
In Harness Making

$5 After 30 DAYS FREE TRIAL

NO BUCKLES
About two-thirds of the strength of a strap is lost by pulling from a buckle tongue. Ordinary harness has 68 buckles.—**Walsh Harness has no buckles.**

NO RINGS
Rings wear straps in two causing early repairs. Ordinary harness has 275 places where there is ring friction. **Walsh Harness has no rings.**

NO HOLES
Ordinary double harness has about 275 holes that weaken straps—**Walsh Harness has no holes.** Easy to see why it is three times stronger.

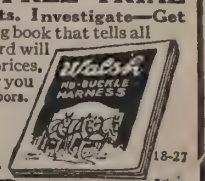
NO BILLETS - NO LOOPS
The loose strap ends, called billets, are hard to put in loops or take out, particularly when it is cold or dark. Ordinary harness has about 70 billets and 100 loops. **Walsh Harness has no billets or loops.**

Walsh NO-BUCKLE HARNESS

Breakdowns with old harness mean costly delays. Don't chance spoiling your crop. It doesn't pay to patch old buckle harness. Send for a Walsh on 30 days free trial now. Send no money. If it doesn't sell itself to you, return it at my expense. My free book describes this new way of making harness.

Walsh Leads Them All

The tremendous success of the Walsh No-Buckle Harness has encouraged many imitators, but with 40 patented, exclusive features and nine years hard use on thousands of farms in every state, the Walsh remains the world's greatest harness value.



Costs Less—Lasts Longer

World's greatest advance in harness making—a harness without buckles to tear, no rings to wear, no holes to weaken straps—three times stronger than buckle harness; handier, better looking. Easily adjusted to fit any size horse. Made in ten styles.

$5.00 AFTER 30 DAYS FREE TRIAL

Balance easy monthly payments. Investigate—Get the Facts. Write for my interesting book that tells all about this wonderful harness. A postal card will do. I will send you my direct-from-factory prices, liberal terms, and user-agent plan whereby you can earn money showing Walsh Harness to neighbors.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

A Big Black Bear

(Continued)

I once accepted an invitation to visit a relative in Northern Michigan. After visiting a time, he sent me to a lumber company farm seventy-five miles back in the woods from Green Bay, where they pastured their horses and oxen in summer that they used in their logging work, and also grew vegetables to supply their winter camps. There were plenty of deer and some black bears as well and occasionally a Canada lynx. I was educated to fear the wolves and bears, supposing that in case I met a bear it must be a fight whether I wanted to or not.

In my deer hunting I got track of a bear that was coming to the lumber camp. I found that a black bear was feeding at the slop hole where all the refuse from the kitchen had been thrown the previous winter. The camp was deserted when the spring freshet came, and everybody went down the river with the log drive.

The lumbermen were acquainted with the bears and their habits and removed the windows, apparently to give the bears free access to the camp. In this case, the bear was having a jolly good time. It was very interesting for me to study what that bear was doing. I found a trail of grease from the slop hole into the kitchen, where he wiped his dirty feet on everything.

This camp was located on the opposite side of the river from the supply road of the company. I had this river to ford every time I visited the cabin, but could wade the river at that point, so it was simply the time it required to disrobe, wade, and dress. I killed a deer near this camp and used the front quarters as bait for the bear, taking the hind quarters back to the farm to apply on my board bill. The seven-mile carry caused me to relish the venison.

The front quarters of the deer I took to the cabin and put one piece in the slop hole with a butter tub over it and the end of a small log on the tub to keep the skunks from getting the bait. Then I went into the kitchen and hung a piece of the venison to a strap that was hanging over the table. The balance I put into a cracker box that was nailed to the wall of the cabin at a height that I could just reach. I thought I might want something to bait with again.

The next trip to the cabin, I found the bait in the slop hole gone and everything rooted around. Then I went into the kitchen, and the piece I had hung up over the table was missing. I got up on the table and walked up where I could reach into the cracker box and found it empty. Well, I did some thinking. He must be a monster if he consumed a half deer at one smell. I noticed there were no bones around, so I thought he must have carried it away.

I now had sufficient proof that there was a bear around, and I knew very well that I was afraid of him. I remember I wrote my brother that I had located a bear, and if I had some one to help me, I would try to get him. I did not have the courage to go seven miles in the woods and watch at night, as I probably would need to do to get a shot. I had not learned at that time that a black bear is a coward.

I learned that the lumber company had a bear trap, so I borrowed it and set it for the bear. I knew I must not make the trap solid fast or he would tear himself loose. I also knew it would not be safe for me to fasten the trap to a log that would make a trail that I could follow, as I would probably get lost and be unable to work my way out.

There were several log chains in the cabin which the lumbermen had left. I fastened them together, making one end fast to a bench that was used as a seat at the table, and put the other end of the chain up through the stove pipe hole in the roof, fastening it to the trap set in the slop hole. I had now exhausted my resources and went back to the farm.

The next morning I went to look at my trap. The first look from the cabin door showed there had been something going on since the day before. The bench to which the chain was fastened was hanging half way up to the roof, and everything within reach was in disorder. But I could not see the bear from the cabin.

Not feeling sure the bear would not jump on me at sight, I climbed up on the cabin roof and looked around, and saw him partially hidden under some brush. He was lying as still as he could, so I shot him in the top of his head, killing him so that he did not even kick. I never quite understood how this shot was so fatal, as I shot a bear a few years later with a double barrel shot gun at short range and broke his neck in several pieces, but he kicked and threw his head about like a stuck hog.

The next operation was to skin the bear. I was surprised to find that a bear is skinned just like a hog, i. e., the layer of fat adhered to the skin so that I had to cut the whole surface. If I pulled the skin as I would a deer, I took all the fat off with the skin. I knew I was to have a load, packing the skin minus the fat, back seven miles to the farm. I put the skin in a two-bushel sack. It made the bag two-thirds full. I got back to the farm about two o'clock. After getting some dinner, I took a rest on the bed, as that bear skin became a burden before I got home. I have skipped an incident that I have always thought was connected with this bear.

One day I was walking along a supply road on a maple ridge. I noticed a black stump, about six feet high, close to the side of the road and about forty rods away. This stump was in a bunch of small maple trees about three feet high. I was walking slowly, as I had a pack of something. As I remember, it was a part of a deer carcass. To my surprise, that stump dropped from my sight in the bushes, and I saw no more, only a glimpse as he passed an opening in the bushes. With my load and surprise, I did not get a shot. I have always thought this was the bear I caught in the trap, as he was a big fellow and nearly as tall as I was as he sat in the bushes.

(The End)

MR. GURLER ON ONE OF HIS HUNTING EXPEDITIONS IN THE NORTH WOODS
Deer and a half grown bear are shown in this picture.

"This bear was over 7 feet tall when standing," says Mr. Gurler, "and weighed over 300 lbs. This rug is over 35 years old."

Little Talks for Juniors

Leadership. Ah, what would this world be without it? What would an army be without a general? What would the nation be without a president?

Can you imagine a ship without a rudder? It would soon be dashed to destruction on the rocks. And that's what would happen to this old world if there were no leadership.

First, came the Great Leader of Men. Through His teachings, He spread the Truth. And He gathered about Him twelve other men and did make of this band other leaders. Ever since that time the world has needed leaders. It needs them today even more.

Perhaps you've been in club work. Pass on the good work. Help others. And there's a secret of leadership—help others. Your own little community is the place to start. *Begin now! ! ! !*

Helen Makes Good Record

HOARD'S DAIRYMAN JUNIORS:—Helen Schweikl, Washington, is a 15-year-old member of the Enumclaw Jersey calf club. Last winter Helen paid $80 for her heifer calf, having to give her note for a part of this amount. She took especial care of her Jersey calf, and spent considerable time getting her ready for the local community fair and finally for the Western Washington Fair at Puyallup.

At the Western Washington Fair there were exhibited 59 Jerseys and in the senior calf open class there were 11 entries. Helen's calf was placed first, made junior champion, and finally made grand champion over all Jersey females at this show.

Before fair time Helen had paid off her note on the calf by picking blackberries for the cannery, so that when she took her calf to the district fair in Puyallup she went entirely free from debt.

This season she won $45 in prizes, in addition to the various ribbons. This is her first year in club work but undoubtedly we will hear more of Helen's achievements in dairy club work in the next few years. The leader of this club is Mr. F. F. Joubert. He is assisted by G. W. Kressin.

Washington. R. M. TURNER.

HELEN SCHWEIKL, WASHINGTON, AND HER CALF

Junior Letters

High School Days

Hoard's Dairyman Juniors:—I'm here again ith a letter. I haven't written for some me but I have always read Hoard's Dairyman nd the junior page.

I am going to high school now and I haven't ad much time to write. I like high school retty well, and I suppose I will like it better fter awhile.

I am only home week-ends and some of the olidays. We have no high school at Debs or inewood so I have to go to Clearbrook and at is about 20 miles from home.

We board ourselves, doing light houseeeping, and I like it very much. That's here the fun comes in. My chum and I oom together. We have two rooms. There re 108 pupils in the Clearbrook high school. take Ancient History, Algebra, General Scince, and English.

My address is care Wm. Iverson, Box 95, learbrook, Minn. I would like to hear from ome more of the Juniors.

Lillian Erickson.

Third Annual Community Fair

Hoard's Dairyman Juniors:—Our third anual commuity fair, which was held on Ocober 12, was a decided success. Much interst was shown in all the exhibits and there ere entertainments, too.

Our farm collection of food and feed prodcts, which consisted of forty items, won rand prize in the agricultural department. here were not many dairy cows exhibited, owever, as our county is not a dairying secion.

We were quite successful with our chickns this year. We raised about 250 pullets nd have about 200 old hens. The pullets, hich were hatched in March and April, have een laying nicely for some time. We feed em milk, corn, sunflowers and home-mixed dry mash, with different ingredients added or left out, according to season.

I like the "Autobiography of a Pioneer Dairyman" very much, as it is so interesting, and is told in a simple style. I always enjoy the juniors' letters too. "How Europe Farms" articles are also very interesting.

I will be glad to answer any of the juniors who may care to write to me. My address is Sealy, Texas. Esther Billig.

A Poem, "Life's Test"

Hoard's Dairyman Juniors:—I have just finished my studies and as I was sitting here I thought up a little poem, so here goes:

There's only one method of meeting life's test;
Jes' keep on a strivin' an' hope for the best;
Don't give up the ship and quit in dismay:
'Cause hammers are thrown when you'd like a bouquet;
This world would be tiresome, we'd all get the blues;
If all the folks in it just held the same views;
So finish your work, show the best of your skill,
Some folks won't like it, but other folks will.

My address is Box 155, Smyrna, N. Y.

A true blue junior,
Mary Elizabeth Boos.

Likes Horse Back Riding

Hoard's Dairyman Juniors:—Received your letter and was glad to hear from you.

My brother drove my sheep out the other day and they did not try to run away.

I am getting along just fine in school. I sure do like my teacher. I went horse back riding the other day. I sure like to ride a horse.

My address is Goldendale, Washington.

Glen Smith.

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

For further discussion of the following see the January 25th issue.

How old a crop is alfalfa? It is of ancient origin. It was upon alfalfa, doubtless, that the flocks of Abraham fed, and when David in his pastoral psalm referred to "green pastures" in which his flocks were made to lie down, in all probability he referred to the rich alfalfa so common to that eastern land. (See "A Fad That Became a Leading Crop.")

What are some of the important points in herd management? 1. The elimination of scrub cows. 2. Growing a succulent feed and legume hay. 3. Having cows in good condition when they freshen. 4. Regularity in feeding and milking. 5. Making cows comfortable. 6. Having barn and feeds conveniently arranged. 7. Controlling disease. (See page 58.)

Where did Ayrshire cattle originate? Two hundred years ago in the County of Ayr in Southeastern Scotland, a group of thrifty farmers pursued the breeding of a beautiful and useful breed of cattle which were named Ayrshires. (See page 59.)

When were Ayrshires first imported into the U. S.? The first importation is thought to have been made in 1822 by H. W. Hills of Connecticut.

How much do Ayrshires weigh? Calves weigh from 60 to 80 lbs. at birth. Mature bulls weigh from 1,600 to 2,200 lbs. and mature cows weigh from 1,000 to 1,600 lbs.

What cow holds the world's record for production in the Ayrshire breed? Nellie Osborne of Elm Shade, a Canadian cow, finished a year's production of 23,223 lbs. of milk containing 1,003 lbs. of butterfat. She was the first cow of the breed to cross the 1,000-lb. mark.

Is summer grain feeding profitable? A 12-year-old Guernsey cow in the Genesee—Eagle C. T. A., Wisconsin, produced 1,117 lbs. more milk for four summer months due to grain feeding. This means $19.75 more profit after paying for the additional feed. (See page 97.)

There are now 280 4-H clubs in Vermont, says a report recently issued by Mr. E. L. Ingalls, State Club Leader.

Fourteen former 4-H club members received their degree in June at the University of Vermont with the class of 1926.

Money Saved is Money Earned

We promised you, in 1923, a much improved, greater rust-resisting, far longer lasting woven wire fence. And we made it. Made it by doing two things—putting more rust-resisting copper *in* the steel itself and a much heavier zinc coating on the outside.

RED STRAND "Galvannealed"

is the same good old reliable Square Deal Fence. Same full gauge and honest weight; same springy line wires; same picket-like stays; same can't-slip knot. The easy-to-erect, trim, strong fence.

But better now than ever before through our "Galvannealing" process (discovered and patented by Keystone) that WELDS an extra heavy rust-resisting zinc coating to copper-bearing steel wire. *No one else makes fence like this.*

Agricultural Colleges, engineering authorities, railroad tests—all prove that "Galvannealed" far outlasts the ordinary galvanized wire. Those who entered "The Advantages of a Well Fenced Farm" contest gave us some mighty good ideas on "Hog Sanitation," "What it Costs to Fence a Farm" and "What 17,000 Farmers Say." Write for these 3 free booklets today. They show what an important part fence plays in increasing your farm profits.

THE FULLER
AUXILIARY TRANSMISSION
FOR FORD TRUCKS

KEEPS THAT LINE OF STEEL UNBROKEN

On that sturdy line of steel connecting foot brake and rear wheels depends the safety of the Ford Truck and its driver.

That line of steel is kept unbroken when the FULLER is installed, because this unit has no neutral position. Its speed change is as fast and positive as the snap of a light switch, and the driver can shift with confidence, going uphill or down. To become stranded in neutral, with foot brake inoperative, is impossible.

There's profit as well as satisfaction in using a device which safeguards both truck and driver, while effectually increasing hauling capacity and speed. See your Ford Dealer.

FULLER FEATURES

Four Speeds Forward—Two Reverse.
No Neutral Position (Brakes always Available).
No Added Strain on Motor, Universal Joint or Drive Shaft.
No Rebuilding Necessary; No Cutting of Drive Shaft.
Installation, 2 to 3 Hours; No Special Tools Needed.
Very Simple and Easy to Operate.
Built by Fuller; Largest Manufacturers of Truck and Bus Transmissions in the World.
Fully Guaranteed for 90 Days Against All Defects.
Price—$60 to Truck Owner.

New National Club Paper

"The Boys' and Girls' 4-H Club Leader" is a new monthly publication issued by the U. S. Department of Agriculture, Washington, D. C., and being sent to all extension workers.

The first number dated January, 1927, contains messages from C. W. Warburton, director of extension, and C. B. Smith, chief, office of co-operative extension work, a story about the National 4-H Club Camp scheduled for June 16 to 22 at Washington, D C., a report of the fifth annual National Club Congress, and several other interesting news items and suggestions on club work.

Age to Breed Heifers

HOARD'S DAIRYMAN JUNIORS:—I am getting a heifer from Ohio now any time and would like to know at what age to get it bred. I read the Hoard's Dairyman and like it very much. I like the stories about dairying best.
Indiana. GLEN BONTRAGER.

The age at which to breed heifers depends upon the size and condition of the heifer. Good, growthy heifers may be bred at one and one-half years of age, perhaps a little younger or a little older. Good breeders generally figure that good, growthy heifers can be bred to freshen at between twenty-four and thirty months of age.

If the heifer is not large and thrifty, it would be better to breed her so that she will come in as a senior 2-year-old. In other words, breed her when she is about two years old.

Handy Nail and Tool Box

The nail and tool box shown in the drawing can easily be made of soft wood. Very often suitable lumber can be obtained from grocery boxes. It is a handy box to carry about the barn, sheds, or along fences when doing repair work. It has three compartments for nails, screws, staples, bolts, or any other fastening devices one might use and a long compartment for tools needed with which to do the work.

The following material is needed to make the box:
1 ⅝"x3⅜"x15½"—center
1 ⅜"x10"x16"—bottom
2 ⅜"x2⅛"x16"—sides
2 ⅜"x2⅛"x9¼"—ends
2 ⅜"x2⅛"x4 5-16"—partitions.
3d (3 penny) common wire nails; paint.

To strengthen the box, the center piece is set into the ends ⅛" deep. This is done by cutting a groove ⅛" deep and ⅝" wide across the end piece 4 5-6" from the end. This is called a dado joint.

When cutting the opening for the handle, first lay out the part to be cut out, then bore four holes with a one-inch auger through that part. The remainder can easily be chiseled out.

Be sure to have the ends of the pieces square with their edges so that the pieces will fit properly when assembling them.

After the box is assembled, apply two coats of paint. Paint beautifies and lengthens the life of the box.
Wisconsin. F. W. DEJMEK.

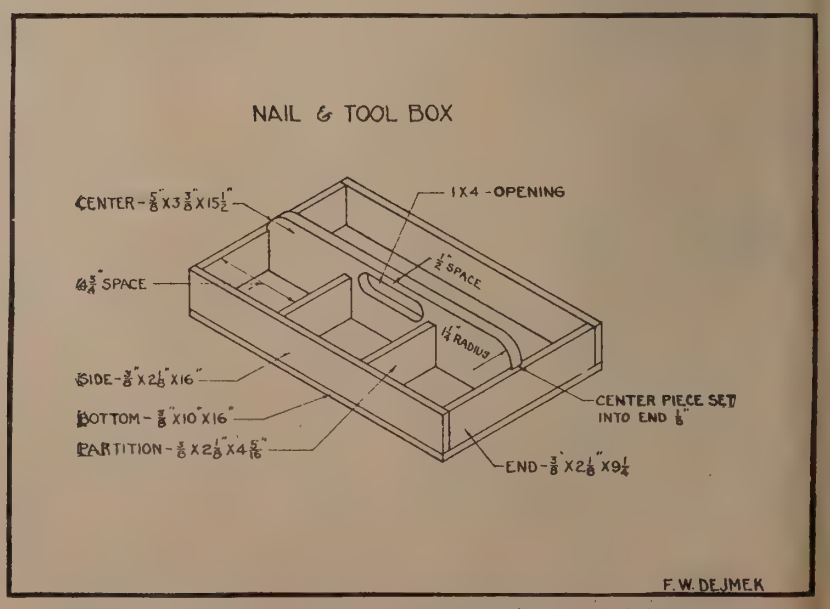
A Utah Champion

Afton Bingham is a Hoard's Dairyman Junior. In Uinta County Utah, where she lives, there is no railroad transportation. When Afton was ten years old, that was in 1923

AFTON BINGHAM AND HER CALF

she bought a Jersey calf and joined the calf club. Three successive years she has won the championship with her calf.

Afton's calf is now a cow. From January 5, 1925, to January 1, 1926 this cow produced 8,306 lbs. of milk containing 370 lbs. of butterfat. Afton sells the whole milk, and she received during that period $231.30.



Besides winning trips to the International Live Stock Exposition for her excellence in calf club work, Afton has won honors in sewing, cooking, and canning club work and has been a real leader in her community.
Utah. O. A. FITZGERALD.

A 4-H Celery Club

In the spring of 1926, 19 boys and girls in Schuykill County organized the first celery club in Pennsylvania. The object of this club was to demonstrate the proper method of celery culture and to introduce a new self-blanching variety known as Golden Plume.

A celery club roundup was held November 5, and every member exhibited six stalks of excellent celery. The boys and girls are convinced that celery can be grown more economically by the level method of culture than by the trench method.

The adults are much interested in the production of celery, and it is probable that more celery will be grown in the community in the future and the results of this club demonstration adopted for culture practices.

HERE'S SOMETHING EASY AND PRACTICAL FOR YOU TO MAKE

LET COWS BE THE JUDGE

Marl Turned the Trick

GEO. M. BRIGGS, Wisconsin College of Agriculture

DURING the early part of 1926, Albert C. Johnson, Wisconsin, daily wondered why it was, upturning his cows out in the pasture, that they would invariably hike right over green looking spots of grass, tall enough to get a mouthful without any effort, to a strip of still greener grass but shorter and made by this daily visit. Extending northwest through his pasture, just like a road, this green strip of short cropped grass extended to the far side of the pasture. Not only were the cows contented to eat this strip, but reached through and loosened the grade at end of strip where it extended beyond the pasture. At each side of this roadlike green spot, grew red squirrel tail, sedges, vervain, and all other lowland weeds and grasses unnoticed and passed by by the cattle.

The season advanced, cattle kept frequenting this already short cropped strip across the field. Mr. Johnson in the adjoining field, fenced off from this pasture, had planted oats and sweet clover in 1926. Upon cutting the nurse crop off, he could observe little sweet clover excepting in a piece joining on the south end of the short pasture strip and here, extending way across the stubble, was the sweet clover sticking far up above the stubble and about hiding the stubble entirely. It made a continuous line from the end of the short cropped pasture strip.

Mr. Johnson scratched his head. Was it an old road? No, it couldn't be because there was an old road near by. Was there manure there? No, but a past experience flashed in his mind, that of two years previously, when he had hauled a load of marl across the field to just get rid of it. And there it was, the eye could see the increased growth of sweet clover; the cows could tell the quicker growing, more tender, more nutritious pasture grass. Later on, the county agent, Mr. Thompson, came along, and he was taken out to see the exacting demonstration; then came a tour of farmers, and finally the crop extension man. In the place of moss, weeds, old ripened up sedges and grasses, was green, succulent pastures, not a moss, just a solid sod of June grass.

Mr. Johnson little knew that he was demonstrating a use of marl that can be enlarged upon about as great for pasture purposes as can marl be used for alfalfa production. Pasture lands will yield to fertilizer application, barn manure, and commercial fertilizer without a doubt, but here lies a great opportunity to the dairymen living near lime deposits of mill waste, marl, or limestone. Our dairymen, it is true, can improve pasture conditions by a sweet clover crop, but what of those 1,000 acres of pastures that by a slight application of lime will become several times as valuable as heretofor. On some soil it may take more than some form of lime but there is every reason to believe that Wisconsin results should be comparable to Ohio's and other states where pasture improvement programs have been carried on; where an acre, when treated, pastures two to four times as many animals as it does in its rundown state.

Albert Johnson is probably only one of many Wisconsin farmers who could testify from their own experiences as to pasture improvement, but to my observation, his demonstration was the most convincing of what a simple application will do. On this same farm was staged the first successful alfalfa planting in Burnett County ten years ago and ever since this time Mr. Johnson has been an enthusiastic alfalfa grower. This year's experience demonstrates that he is interested in the use of marl in improving the carrying capacity of his pasture lands.

State Champion Holsteins

Two heifers in the herd at Milford Meadows Stock Farm, Wisconsin, recently finished year records that put them at the head of their respective classes in the state and ranked them high among producers of that age, the country over.

Milford Ormsby Oak Aaggie recently finished a Class B year record as an aged cow, with 19,409 lbs. milk, 739.74 lbs. butterfat (924.67 lbs. butter) after carrying a calf 236 days of her record period. This ranks her second among state producers and her production figures for 305 days entitle her to first place in that division.

Milford Ludwig Bess Burke, a 2½-year-old in the same herd, finished her year's production with 19,458.3 lbs. milk, 682.168 lbs. fat (852.71 lbs. butter). This gives her second place for her age among all black and whites and first in the state. She lacked but a few days of meeting the calving requirements for the 305-day division.

Get more out of your light plant

For every make of plant

Plenty of current for your churning, feed-grinding, pumping, house lighting, when you equip your plant with Universal Nu-Seal batteries.

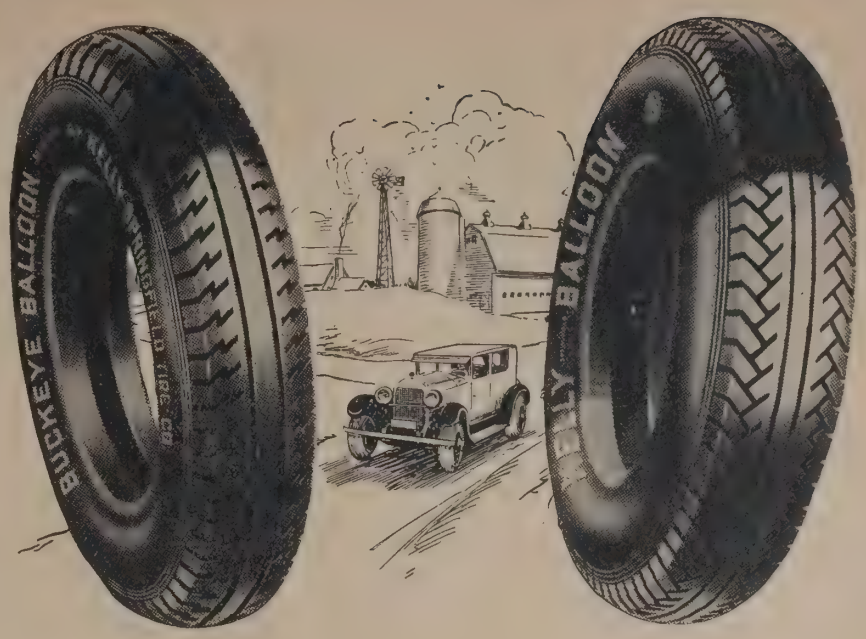
Less care

They're easier to care for, require less frequent filling, can be depended upon at all times to give an abundance of lively, powerful current.

Long Life

Thick, long-lasting plates built from the finest materials we can buy. Transparent glass cells, sealed in the way we originated. Plenty of sediment space. A type to replace any make on the market.

We'll take old batteries



Generous trade-in allowance on your old set that makes new set cost less. Get our price and—

Battery guide FREE!

Big free book that tells you all about how to care for all farm light, radio and auto batteries. Send for copy today—free.

FEED-BUYER'S GUIDE

FEB. 1927

Brief facts about Unicorn Dairy Ration
By CHAPIN & COMPANY

Dip your measure into a sack of Unicorn and it comes out full more times than it will with any other 100-lb. sack of feed.	Unicorn is the "old-reliable" of mixed feeds. Made for the past 21 years by a company established in 1874.
Unicorn is light and bulky. Can be fed straight without harm to the cow. Prevents impaction.	Keeps cows in good condition. No stomach trouble at any time. No udder trouble when freshening.
One qt. (dry measure) of Unicorn, weighs 13.5 ozs.; 1 bushel weighs 27 lbs. Each 100-lb. sack contains 3⅔ bu.	No glass, nails or other refuse in Unicorn. Before sacking, it is run over a magnetic roll and given a final screening.
Unicorn is made of cottonseed meal, corn gluten meal, linseed meal, corn gluten feed, dried brewers grains, corn oil meal, wheat bran, hominy meal, bone charcoal, calcium carbonate, salt.	Unicorn is always the same. No change ever made in analysis or ingredients. This means that fed straight, or mixed with your own grain, you always get the same results.
The analysis of Unicorn is: 24% Protein, 5% Fat, 50% Carbohydrates and 10% Fiber.	Cows take to Unicorn quickly; they like it's taste. Every bit of every feeding is eaten up clean.
Unicorn can be fed with your own grains—corn, oats, barley, corn-and-cob meal. No need to use any other protein or wheat feed.	With Unicorn, you can count on cutting your present grain cost 20c to 50c on each 100 lbs. of milk your cows produce.
Unicorn contains the right amount of lime to insure against shortage of lime in poor roughage.	Ask your feed store man for Unicorn. If he can't supply you, write us at Chicago for name of nearest Unicorn store.

KEEP TAB ON YOUR COWS Send 5c in stamps for samples and prices of our weekly and monthly Milk Record Sheets. Hoard's Dairyman, Fort Atkinson, Wisc.

DAIRY MARKET NEWS

Twin City December Milk

The Twin City Milk Producers' Association paid $2.52 a hundred for 3.5 per cent milk delivered in St. Paul during December. The Association handled 22,516,478 lbs. milk, of which 45 per cent was surplus.

Cream patrons were paid 59 cents a pound for butterfat in first grade cream during December. This is 4.3 cents above the average price of 92-score butter on the New York market.

Sheffield December Price

The cash price for December, 1926, paid Sheffield producers for three per cent Grade B milk in the 201—210-mile zone is $2.74 per hundred pounds with the usual freight and butterfat differentials. This is equivalent to $2.94 for 3.5 milk and is an increase of 7 cents over the November price and an increase of 10½ cents over the price for November, 1925.—C. W. HALLIDAY, Secretary.

January Milk Prices

(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 105 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributors' country plant:

Table I—January Producers' Prices by Geographic Sections

Sections	Range of prices per cwt.	Comparison of average prices 1927 Jan.	1926 Dec.	1926 Jan.
New England	$2.77—3.82	$3.37	$3.47	$3.49
Middle Atlantic	2.55—3.15	2.85	2.85	2.75
E. No. Central	2.05—3.19	2.61	2.61	2.58
W. No. Central	1.75—3.10	2.35	2.35	2.31
So. Atlantic	2.80—5.81	3.90	3.91	3.95
E. So. Central	2.35—3.39	2.70	2.70	2.64
W. So. Central	1.93—3.04	2.73	2.71	2.87
Mountain	2.15—3.20	2.56	2.56	2.52
Pacific	2.00—3.13	2.72	2.67	2.87
United States	1.75—5.81	2.86	2.85	2.89

Prices paid per hundred pounds for standard grade milk (Grade B, 3.5%) at the dealers' country receiving stations or at the producers' railway shipping points, as also price f. o. b. city, are given in Table II:

Table II—January Prices at Country Stations

	At country stations	Freight zones to which prices apply
New Haven	$3.70*	28c rate
Wash., D. C.	3.02*	35c 10-gal. can
Chicago	2.50	All
Baltimore	2.97*	35c rate
Boston	2.88*	181—200-mile zone

January Butter and Chees

January butter in New York declined f 53 cents to 47.5 cents, then rising one cent the 26th and holding there the next day

January saw butter decline to 47.5 cents from its high point of 56 cents in December, the average for the first 26 days being 5.5 cents under the December average. As shown above, however, the present month's average of 49.2 cents is 4.5 cents above a year ago and over 9 cents above two years ago.

this report is written. The market ruled at this advance, with dealers holding for miums. The average for the month will about 49.2 cents, a drop of 5.5 cents from December average but 4.5 cents above Janu of a year ago and 9 cents above January, 1

Receipts of butter thus far in January 50 thousand tubs less than for the same pe a year ago and the storage holdings are million pounds less. Production reports s a decrease from last year. The January report of the government discusses the q tion as follows:

"Indications are that there is a possib of a shortage of fresh butter, not due to decrease in the make, but to the fact storage stocks have been quite closely pi over and users of storage are turning to f stock for their supplies. It will be an unu year if domestic production during Janu and February is sufficient to supply consu tive requirements."

Cheese at the Wisconsin Boards continue maintain a firm position during Janu prices advancing a half cent and averag 25.5 cents for the month. This is nearl cent higher than in December and over a higher than for January during the past years. Cheese receipts at the four large kets decreased two million pounds from year, with the storage holdings at these kets seven million pounds less than a year

The Feed Market Situati

(The Grain, Hay and Feed Market Service, Bureau of Agricultural Econom U. S. Department of Agriculture.)

The supplies of feed grains and by-pro feeds have been generally sufficient for fee requirements this season to date and p on the whole are about the same as a year or slightly lower. The combined tonnag feed grains available for the 1926—27 sea including corn, oats, barley, and grain ghums, is about 5 per cent smaller than a ago, but this decrease is partially offset further reduction in the number of ani on farms. Increased crops of feed grains forage in the South have reduced the den for feed from that region but smaller c in the western Corn Belt States and some western states are causing some movemen grain and hay in that section.

Prices of wheat feeds are now avera higher than a year ago. Heavy milling lower prices early in the season have counterbalanced by increased takings and

rings both from mills, and jobbers recently ıve been hardly equal to buyers' require- ents. Wintry weather has stimulated the de- and and prices have advanced slightly during e past few weeks.

With a crop of cottonseed about 15 per cent rger than last year, offerings of cottonseed eal early in the season were unusually large ıd prices were forced to the lowest level since e war. These low prices, however, stimu- ted both domestic and export demand and is resulted in a rapid absorption of the rger supplies. Considerably more meal, how- 'er, appears to be available for the rest of e season, as only about 400,000 tons more ed had been accounted for through the 'ushers to January 1 than a year ago, al- ough the crop was over a million tons larg- . While cottonseed meal prices have ad- ınced sharply recently as a result of a con- ıued active demand and the reduced offer- gs from crushers and jobbers, they are at is time still about $2.50 lower than a year 'o. The domestic demand during the next onth will be influenced materially by weather nditions and the stocks that retailers and nsumers now have on hand.

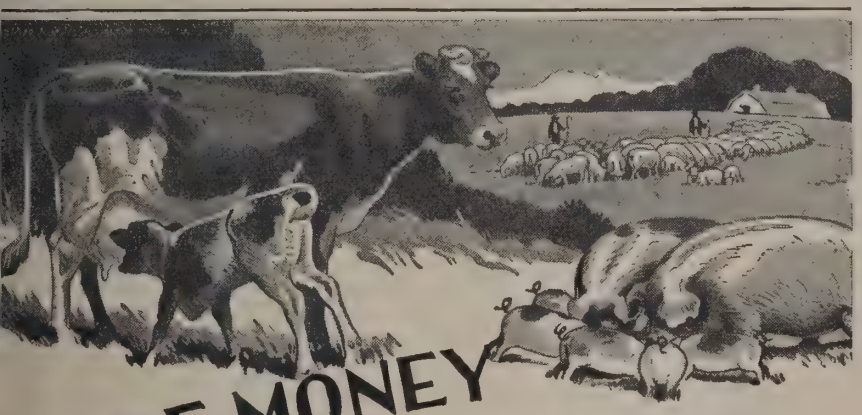
ttonseed meal—43%	35.00	37.30
Chicago		
andard spring wheat bran	29.25	28.50
andard spring wheat middlings	29.25	28.50
uten feed	29.75	38.90
hite hominy feed	31.50	29.50
ttonseed meal—43%	35.50	39.50

The lower prices of cottonseed early in the ason also held linseed meal prices generally wer than last year. With the advance in cot- nseed meal prices, however, the linseed meal arket has also strengthened and at this writ- g (Jan. 25) are practically as high as at is time last year. While the domestic crop flaxseed was smaller than the 1925 harvest has been supplemented by larger imports of rgentine seed. With liberal supplies of flax- ed available in Argentina again this year enty of this feed will be available during the winter, provided that the United States price is sufficiently high to offset the drawback of about $5 per ton allowed on linseed meal ex- ported from imported seed.

Heavy production of starch, syrup, and such corn products has resulted in a large supply of gluten feed and meal which has helped to reduce prices of this feed well below the level of a year ago. Supplies of hominy feed also have been sufficient for the trade demand at prices practically the same as at this time last year. Lower corn prices have also been a fac- tor in the price of these corn product feeds, and unless demand becomes more active it seems probable that gluten feed prices will re- main considerably lower than last year.

Quotations of the principal feeds at some of the larger distributing markets on January 22, 1927, are shown in the preceding table.



Brown Swiss Cattle in the United States

MORE MONEY
to be made in
STOCK-FARMING
in the SOUTHLAND

And more ease and comfort in doing it here in the Southland served by the Louisville & Nashville Railroad, than in the less-favored Northland.

The Climate in this territory is a big factor—no hard winters, requiring expensive barns and costly, long-continued feeding—green pastures all the year, and stock-feed raised right on the home farm. Plenty of *farm help* at low wages. Abundant water, local and neighboring markets, with top prices for beef cattle and calves, hogs and pigs, sheep and lambs, and dairy products of all kinds. Adequate transportation to outside market centers.

Write and state what kind of stock farming you want to do, and you will be promptly informed where and how it can be done in the Southland. (We cannot, however, undertake to find salaried employment for anybody.) Full information and descriptive booklet will be sent *free* on request. Address G. A. Park, Gen. Imm. & Ind. Agt., L. & N. R. R., Dept. H. D.-5, Louisville, Kentucky.

L&N

Strains 100% Clean or your Money Back

Dr. Clark's Purity Milk Strainer is the only strainer on the market *guaranteed to get all the dirt, dust and sediment or your money back.*

Because it is the ONE strainer that strains absolutely clean is the reason why it is used and recommended by practically all the large dairies, creameries, condensarics, thousands of farmers.

WHY TAKE CHANCES

when you can use Dr. Clark's Purity Strainer with its sterilized cotton disc and KNOW that your milk will grade *100% clean?*

Dr. Clark's Purity Strainers are simple to use and easy to clean—save time—bring you higher prices for your milk. Also best for straining maple syrup, vinegar, cider and home beverages.

Sold by good dealers everywhere. Two sizes, 10 quart and 18 quart. Write for descriptive folder and our 10 Day Trial Test Offer. If your dealer can't supply you, we will. (2)

10 Day Trial Test

Write at once for our 10 Day Trial Test Offer. Find out how you can test the PURITY Strainer and get your money back if it doesn't remove every particle of dirt from your milk. Get all the facts. A postal or letter brings you complete information "10 Day Trial Test Offer" by return mail.

DR. CLARK'S Purity MILK STRAINER

Do you want *more* milk and *larger profits?*

How Many Cows Do You Milk?

Do You Want More Milk And Larger Profits From Your Dairy Herd?

Do You Feed Cottonseed Meal To Your Cows Every Day?

Successful feeding consists of maintaining the cow in good health and vigor. But that's not all. It means getting the *most* milk at the least cost.

Producing dairy cattle need a definite quantity of rich protein feed. The high protein content of cottonseed meal makes it especially valuable in dairy cattle feeding. Per dollar invested you get more digestible protein in one hundred pounds of cottonseed meal than in any other concentrate.

How *to feed for* most profit *is a BIG question. Let our dairy specialists offer a suggestion that may prove valuable to you.*

Fill out the attached coupon and mail today. We will gladly send you this authentic and valuable folder on dairy feeding.

Seasonable Live Stock Notes

THE right kind of feeding is so closely related to success with cows that we are reminded to suggest that right now is a good time—none too early—to begin thinking about growing more of the best crops for cow feeds. Alfalfa is a good feed but to have plenty of it when needed one must do something about it now or soon. There is the lime to be looked after if it is needed; good seed of the right place of origin must be secured; the inoculating culture must be secured. Time flies, and a decision to do the right thing now is worth more than any decision made after it is too late.

A Fit Place for Little Pigs

It is nearly the middle of February, and on some farms little pigs are already getting acquainted with their surroundings. A little pig has no choice of his place to be born; it has no control over the kind of place in which it spends its early life—nor later for that matter. Environment to a little pig is a mighty important factor. Now is the time to plan a fit place for pigs if they are to escape injury, disease, and parasites.

Cornstalks Poor Cow Feed

We find, among inquiries received, some dairymen who still insist on turning cows into stalk fields, apparently in the hope of making the good feeds hold out longer. Rarely will a cow get enough of nutrients from cornstalks to pay for the energy used in foraging around to find something she will eat. Such a practice undoubtedly does make the good feeds hold out longer, but we question if it enables cows to keep up their good work. Making the feed last longer and getting the best production from the cows are not the same thing.

On Preventing Roup

Roup is a disease frequently experienced in poultry flocks during late winter. It attacks flocks in poor condition more frequently than those that are well housed, properly fed, with quarters kept clean. Preventing roup by good management is to be advised above trying to cure the disease after it has started. In fact, curing roup is a speculative task. The damage in lowered production and death loss is already done by the time the curative agent is employed.

Early Hatched Chicks are Best Producers

Profits in egg production are somewhat in relation to the proportion of eggs produced during the winter months or during the time of highest prices. Good winter egg production has its beginning partly in the time chicks are hatched, the early hatched pullets being the better producers. It is now time to arrange for a supply of early hatched chicks and also for their care after they arrive. It is worth while, also, to know something about the ancestry of the chicks one gets. Getting scrub chicks is even worse than getting late hatched ones.

Sweet Clover Pasture

Manitowoc County, Wisconsin, has 10,000 acres of sweet clover for pasture and more is being seeded. It is nearing the time when those who have been thinking about giving their cows more feed and better feed will have to make a decision to seed or not to seed. If soils are acid, sweet clover needs lime. One cannot get lime day after tomorrow like buying soap at the grocery store. It usually must be ordered several weeks before the time it is to be used. Many times we have heard the alibi, "I intended to sow some sweet clover last spring but could not get the lime in time." One should always remember that good sweet clover pasture next year means doing something this year.

The Future Dairy Cow

Dairymen and beginners are scouring the country for good dairy cows. The good ones are not for sale and the poor ones are meeting with critical buying. All of which suggests a bright future for the well grown dairy heifer of good ancestry. The future supply of good cows depends much on the present practice of selecting and feeding dairy calves. Are the poor ones being culled out? Are the good ones being fed adequately as to give them normal development when they begin work? These are important questions.

Too Much Bedding is Bad

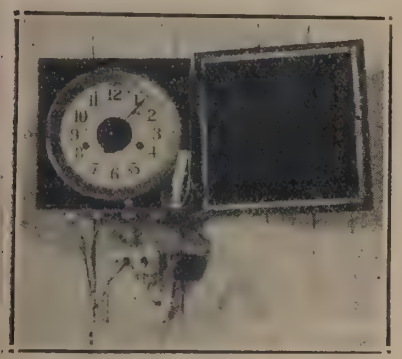
The amount and character of the straw supplied a sow for bedding when she is ready to farrow has considerable bearing on the number of pigs saved, especially if the owner is not around frequently to make things right. The pigs frequently get lost in straw that is too coarse and too much bedding results in a deep hole in the middle of the pile which is all right until the sow decides to get up and lay down again. Then there are too many pigs in the wrong place. A limited supply of bedding of medium fine texture is better, at least until the pigs are more active.

Regina of Fairydale has just won sixth place in Class B with a record of 16,105.1 lbs. milk, 906.7 lbs. fat. She holds ninth place in E with 773.2 lbs. fat and has a Class G. record of 10,402.7 lbs. milk, 573.9 lbs. of fat. Regina was bred and is owned by Geo. C. White, a Guernsey breeder of New York.

Electricity for the Farmer

(Continued from page 111)

light on all of the floor. Shadowy corners invite them to loaf and sleep.



The standard lighting calls for a 40-watt Mazda lamp placed six feet from the floor and fitted with a sixteen-inch metal reflector four inches high. The inside of the reflector should be painted with aluminum to make the lighting conditions perfect. This will light a circle fifteen feet in diameter.

The diagrams shown on page 111 illustrate the arrangement of lights recommended by the Washington Station.

The times for lighting the houses can be arranged so that they will fit in with the rest of the farm work. Those in general use are:

Evening lunch	8:00 P. M.	9:00 P. M.
Evening light	Dusk	7:00 P. M.
Morning and evening	7:00 A. M.	Daylight
	Dusk	7:00 P. M.
Morning light	4:00 P. M.	Daylight

When they use the evening or night feeding, many farmers have a system of dimming which warns the birds

This clock turns the lights on at ten and off at eleven for an evening lunch for the hens. The farmer throws the feed in when he does his evening chores.

that the lights are going out and sends them to their roosts. But it is being recognized generally that when the bird's crop is full, she will go to bed with the lights on, and they are avoiding this extra step in the wiring and control necessary. When they do not dim the lights, they feed the flock heavily to insure their getting their crops full.

Automatic time switches are on the market and in use in large poultry farms. But many farmers who raise flocks only as a profitable side line are proving themselves very ingenious in rigging up arrangements with ordinary alarm clocks to turn the lights on and off.

The diagram shown on page 111 shows a control device in which two clocks turn the lights on and off at any pre-determined hours. Each clock has a rigid key which turns as the clock arm rings and trips the tumbler switches set in its path.

Lighting should begin in the fall as soon as the hens have finished their moult, and should continue until about April 1st.

An accurate idea of the cost of furnishing lights to hens may be gained from the following example: A flock of 100 hens can be comfortably kept in a 20x20 house. Two 40-watt lamps will effectively light such a house. Morning light from 4:00 a. m. to 7:30 a. m. require three and a half hours a day.

3½ times 2 times 40 watts equals 280 watt hours a day.

280 watt hours times 30 equals 8,400 watt hours or 8.4 Kw. hrs. a month.

For a one-hour evening lunch the current will only be:

30 times 2 times 40 watts equals 2,400 W. h. or 2.4 Kw. hours a month.

If this portion of the current comes on a 3c rate, lighting the hen house for three and a half hours a day will only cost 25.2c a month, and the evening lunch will cost 7c. Even at a 10c rate the lighting of a hundred hens for the morning period will only cost 8.4c. If the lighting results in bringing the production to 60%, a by no means uncommon achievement, a dozen and a half of the daily five dozen would pay the bill for the light that secures them.

Results of Lighting Tests at Oregon Agricultural College

(The lights were turned on October 1 and continued until April 1)

As a steamer was leaving the harbor of Athens a well-dressed passenger approached the captain and, pointing to the distant hills, inquired:

"What is that white stuff on those hills, captain?"

"That is snow, madam," replied the captain.

"Well," remarked the lady, "I thought so myself, but a man just told me it was Greece."—Everybody's Magazine.

Can you hold your children on the farm?

"THIS country offers splendid opportunities for the man with small capital," says Ernest G. Herbold, of Morristown, South Dakota, "if he is a thrifty, hard-working fellow. It's a healthy climate. For cattle and horses our grass for pasturing cannot be beat. It is great for milk production, also young stock does fine on it, and gets fat. Milk is the back-bone of farming."

Mr. Herbold came out here with $2000 capital, and now owns and farms 320 acres. He averages per acre, 20 bushels wheat, 40 bushels oats, 35 to 50 corn, and 40 to 45 bushels of barley. He finds that feedings can be done at low cost in alfalfa and sweet clover pasture, hogging off corn.

He raises chickens, and grows all the garden crops he needs, including beans, turnips, beets, pumpkins, cucumbers, tomatoes, lettuce, radishes and watermelons.

"We have every bit the same service as on high-priced land back East—such as daily mail, telephone, good roads, good water, cheap fuel, a good market."

Morristown is a modern young city with every convenience and improvement to make community life interesting and progressive.

TO PUGET SOUND
THE CHICAGO MILWAUKEE AND ST. PAUL RAILWAY
ELECTRIFIED

THE growing young man who is worth his salt is restless. He wants a place of his own. That is human nature. You felt the same way when you started out in life, thinking of new surroundings, planning a future for yourself. But there is a wonderful way to give a worth-while boy his head, and yet keep his loyalty and interests close to yours!

If he is capable and ambitious, you can afford to send him out to Montana or western North or South Dakota. There is still some choice range here, and rich farmland, that can be bought cheap. He is certain to prosper mightily with the increasing prosperity of the region.

Men who brought their brides in stage coaches to the warm fertile plains and valleys of western North and South Dakota and Montana are today—while still in prime manhood—men of means and assured income. The cow towns to which they went are modern young cities with broad paved streets, unlimited cheap electric power, up-to-date stores, splendid schools, churches, fine roads and convenient markets.

Yet their success is small compared to what lies before young farmers of today. Montana is just emerging from its pioneer period in agriculture. Land as fine as the soil of Indiana and Ohio is still cheap. Rich markets are near or easily reached. The country is wonderful. Thousands of tourists pour in every year just to see it and enjoy it.

This is the country that produces "super-grade" wheat. It also produces butter as fine as any in the United States. Diversification has come in with surprising results. Potatoes, dairy products, poultry, dairy cows, beef herds, horses, sheep, hogs are all producing great wealth. Over half a million acres in this territory have already been growing corn.

There is a great movement up in the Northwest. The marvelous development of such cities as Mobridge, Miles City, Lewistown, Great Falls, Spokane, Butte, Tacoma and Seattle indicates what the future is likely to be when people learn more of the resources of this richest part of the nation.

Increasing Production of the Grass Herd

GLENN DEGNER, MINNESOTA

THRICE a day milking, alfalfa, and a drinking cup system can increase the butterfat production of an average herd on a diversified Northwest farm at least 30 per cent. This fact was revealed by a comparison of the butterfat production made by the same twelve grade Holstein cows during a period of six months of last winter and during a period of the same length in corresponding months the previous year. Changing from a twice to a thrice a day milking schedule, equipping the stalls with individual drinking cups, and substituting alfalfa hay for clover comprise the improvements in Mr. Grass' dairying methods which added $425 to the gross profits of the department for six months. Mr. Grass is a member of the Owatonna Cow Testing Association of Minnesota and his herd book shows that the twelve cows increased their output 834.97 pounds fat which, multiplied by 51 cents, the average price of butterfat, equals an increase of $425.84 from butterfat alone.

The records of production during the year ending in 1925 when the herd averaged 308 pounds fat per head with ordinary farm herd care, are evidence that Mr. Grass is an efficient dairyman and a judge of good cattle. During the half year period beginning October 1, 1924, the butterfat yield was 2,209.1 pounds produced on a ration consisting of silage, fodder corn, clover hay, ground oats and barley, bran, linseed meal, and ear corn during the early part of the period. The total feed cost was $517.19. This in terms of cost per pound of butterfat equals 23.5 cents, without considering the value of the skimmilk which indirectly brought returns through the 125 hogs marketed annually.

To an average diversified farmer this return from one department would place Mr. Grass out of the health type class of farmers. Nevertheless, believing his herd could increase the monthly cream check by a three-time-a-day-milking plan, as used by another member of the testing association on a few cows during that year, he adopted this plan. In addition he installed a drinking cup system in his barn and improved the roughage with alfalfa hay at the beginning of his second year in the cow testing unit. Except for earlier housing, necessitated by an unusually cold and wet October, these were the only influences on the increased production of the 1925—26 period that the owner and tester, Fred B. Hedberg, could discern.

On an average each cow produced 69.58 pounds of butterfat more during the second period ending March 31, equivalent to 11.6 pounds a month. Most notable is the fact that this increase was made under very ordinary farm conditions, with no extravagant outlay in buildings. With its recording of the feed costs and production account, cow testing pointed the way to this profitable change in the dairy methods, which signify that three times a day milking is practical during the winter months. Little theorizing was indulged in during my interview with Mr. Grass, nor was it necessary, for the herd book tells the story completely and exactly. "If it didn't pay I wouldn't be doing it." That was the terse statement he made regarding the results of what was a new step in practicing a three-time-a-day-milking plan on an average farm in this section.

Labor costs necessarily increase under the three times a day milking. However, Mr. Grass always hires a man to assist him in operating his 160 acre farm, so this change merely necessitated a rearrangement of time spent on the farm activities. As a result the total labor cost remained the same with a more systematic adjustment of time.

The accompanying tables show the total and individual milk and butter

MR. GRASS OF MINNESOTA WHO FOUND THREE TIMES A DAY MILKING PROFITABLE DURING THE WINTER MONTHS

fat production, feed costs, and date of freshening for the two periods. During the period of 1924—25, four heifers were in their first season of milking to which a casual observer might ascribe the increase of the herd. However, the remaining eight cows produced 1,570.6 pounds of butterfat the first six months and 2,074.2 the second period, an increase of 494.6 pounds or 31.3 per cent.

Rough	7,021	237.3	43.04	Sept.	
Belle	6,798	265.1	45.10	Oct.	
Lady	7,894	276.4	45.70	Oct.	
Black	7,944	317.3	46.00	Oct.	
Bettie	4,974	187.3	40.04	Jan.	
Total	86,489	3,044.07	$536.88		
Ave.	7,207	253.68	44.74		

Feed costs were computed at the same rate for both years, the total cost being $19.69 greater during the second period of six months, or an average of $1.64 per cow. This slight increase in cost is more than offset by the total increased production of 83 pounds fat, which at the prevailing price of 51 cents a pound brought Mr. Grass an increased return of $425.83 or $35.48 per cow. The average profit per cow over cost of feed during the first period was $50.79, which was increased to $84.64 during the second period. This shows an increased pro-

per cow of $33.84 over feed cost for
ie second period, or a total of
106.15 for the 12 cows in the herd.
The feed cost per pound fat was re-
ıced from 23.5 cents during the first
eriod of 17.6 cents during the second
eriod. This is a reduction of 5.9 cents
pound or 25 per cent lower cost.
educed to terms of butter this lower
st is equivalent to an increase of
early five cents a pounds for butter,
hich would be considered very at-
active in any marketing plan and
ould bring in a large and enthusias-
c membership of any organization
ccomplishing this result.
The feed consumption during the
vo periods illustrates the value of
e better roughage supplied during
e second period. There was a reduc-
on in the feed consumption per cow
over 1,000 pounds in dry roughage
id 500 pounds silage, with an in-
ease of nearly 600 pounds grain.
he cost per pound fat was most
rgely affected by the decreased con-
mption of roughage, as during both
eriods it required practically 9 lbs.
ain to produce 1 lb. fat.
The following table gives a record
the kind and average amount of
ed consumed by each cow during the
vo periods:

ble III—Average Production and Feed Consumed by Each Cow During the Two Six-Month Periods

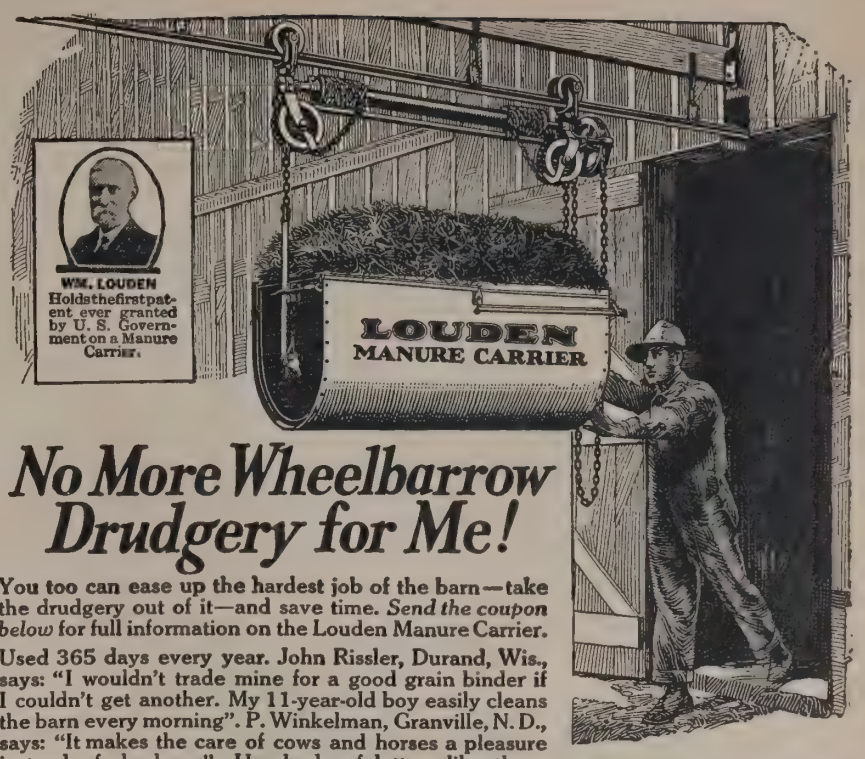
The twelve cows on which the rec-
ds were compared and two heifers
ded last fall comprise the milking
rd on the Grass farm, which occu-
es a quarter section located near
avana village. A herd of fourteen
ad might seem at first mention to
too small for so large a farm, yet
e plan of fewer and better cows,
red for and fed efficiently, has
oved to be the most profitable.
In addition to dairying, Duroc-
rsey swine are raised extensively
d contribute a large share of the
tal income of the farm, as there
no other source of revenue beside
irying and swine except an av-
age farm poultry flock. About 125
gs are marketed each year.
EDITOR'S NOTE:—The rather un-
ual increase of 40 per cent in pro-
ction aroused our interest and we were inclined to ascribe a no inconsiderable amount of this to the two rations fed. However, we were surprised, as the reader may be surprised, to find that according to standard analysis the cows during the first period received more than sufficient total nutrients to produce the same quantity of milk they did in the second period, but they did lack something over a half pound of protein to do this. During the second year, although the daily allowance of total nutrients was less and the protein was greater, they had sufficient total nutrients for the amount of milk produced and were slightly under the required protein. The following tabular statement shows these comparisons:

Table IV—Computations Based on Tables I, II, and III Showing Digestible Nutrients Consumed, and Daily Production Per Cow During the Two Six-month Periods Ending in March 1925 and 1926, Together with Feeding Standard Requirements for the Indicated Production

	First period	Second period
1. Total protein per cow, lbs.	396	448
2. Total nutrients per cow, lbs.	3,996	3,751
3. Daily protein per cow, lbs.	2.2	2.5
4. Daily nutrients per cow, lbs.	22.2	20.8
5. Daily milk per cow, lbs.	27.3	40.0
6. Average per cent fat	3.74	3.52
7. Required daily*	3.75	3.50
A. Protein	2.1 to 2.2	2.6 to 2.8
B. Total nutrients	16.1 to 17.6	19.3 to 20.9
8. Nutritive ratio		
A. As feed	1 to 9	1 to 7.6
B. Standard requirement	1 to 7	1 to 6.5



*Minimum requirements for a 1000- to 1200-pound cow producing the quantity and quality of milk shown in 5 and 6.

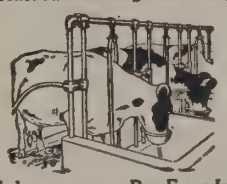
The standard analysis may not tell the whole story, particularly when applied to the corn fodder which was fed at the rate of 14 pounds daily during the first period and only 6 pounds daily during the second period. It is quite possible that the cows did not recover 3% protein and 53 per cent total nutrients when corn fodder was consumed in these quantities daily. In general, the improved effect to be expected from the ration of the second year was quite largely in its better balance and the increase in protein. However, even during the second year when the total nutrients supplied were approximately correct according to the standard, the nutritive ratio stood at 1 to 7.6 instead of the recommended ration of 1 to 6.4 for the production of 40 pounds daily of 3.5% milk.

From the record as given it would appear that the 40% increase in production was quite largely the combined effect of three times a day milking, adequate water supply, and a somewhat better balanced ration, and possibly that intangible improvement in production of cows in certain years without apparent reason. The owner of these cows has an excellent record of production to strive for and to beat, besides which he has the satisfaction that comes from an increased profit of over $400 for six months of intelligent work.

THE GRASS HERD THAT TOLD AN INTERESTING STORY

No More Wheelbarrow Drudgery for Me!

You too can ease up the hardest job of the barn—take the drudgery out of it—and save time. *Send the coupon below* for full information on the Louden Manure Carrier.



Used 365 days every year. John Rissler, Durand, Wis., says: "I wouldn't trade mine for a good grain binder if I couldn't get another. My 11-year-old boy easily cleans the barn every morning". P. Winkelman, Granville, N. D., says: "It makes the care of cows and horses a pleasure instead of drudgery". Hundreds of letters like these.

LOUDEN
Labor-Saving Barn Equipment

Fill out the coupon now—while you are thinking about it—for the latest news about the labor-saving and profit-making results from using Louden Barn Equipment. Durably built and reasonably priced. *Louden Steel Stalls and Stanchions* keep cows securely and comfortably in their places—permit them to lie down and get up easily, in "pasture-comfort". Individually or lever operated. *Louden Water Bowls* promptly increase the milk yield and pay for themselves in a few weeks. Save turning cows out to icy tank water—make more money.

This Big, Durable Louden Manure Carrier

Takes out the equal of 5 wheelbarrow loads at a trip. An easy push. Get the full description—coupon brings it. Worm gear hoist, steel rail track, heavy tub spot welded—a carrier for lifetime service, and the biggest time and labor-saver you can put in your barn. Fill out and mail the coupon.

The Feeding of Dairy Cows

(Continued faom page 112)

during which time feed them adequately to the extent that they will be in good condition when they freshen. For cows that produce up to 300 lbs. of fat a year, the above practice in most cases will suffice to meet their mineral requirements. The chief factors are the feeding of plenty of legume hay, the rest periods, and the adequate feeding when dry.

Direct sunlight and green grass are known to influence mineral assimilation to a greater extent than any other factors. From this it follows that the best time to build up any mineral depletion that may have occurred in the cow's body during the time of her greatest need is in the summer time, in direct sunlight, on green grass when the cow is dry.

The same practice applies also to higher producing cows but it is thought that even with this their mineral requirements are not fully met. To supplement the ration a simple mineral mixture is recommended. The mixture is composed of equal parts by weight of salt, bone meal, and finely ground limestone. It may be self-fed or 3 to 4 ounces given daily to each cow in her feed. It is advisable to feed it the year round. There is no objection to feeding it to lower producing cows.

The salt supplies sodium and chlorine, the bone meal supplies calcium (lime) and phosphorus, and the limestone supplies calcium. In sections where goiter in calves is experienced, it is recommended that a tablespoonful of a solution of one ounce of potassium iodide in one gallon of water be sprinkled on the feed of each pregnant cow each day for at least the latter half of the pregnancy period.

Vitamins

Of late years science has discovered that proteins, carbohydrates, fats, and mineral matter are not the only factors that influence the nutrition of cows. These new discoveries are called vitamins of which five have been somewhat studied more for their effects rather than their composition. Of these five, only two or possibly three are of concern to dairymen.

Vitamin A, the first discovered, is found in butterfat, cod liver oil, yellow corn, and in the green parts of plants. It is not rendered inactive by drying as in haymaking. Well cured hay, especially legume hay, suppli this vitamin in liberal amounts and is thought that cows liberally fed good roughage receive enough of th vitamin to meet their needs. Cere grains, aside from yellow corn, a generally poor in vitamin A. Ski milk is likewise poor in vitamin A, fact that must be considered in fee ing young calves. Some whole mi containing the fat should be conti ued until the calves begin to eat so legume hay. Skimmilk may then entirely substituted for whole milk

The chief functions of vitamin seem to be to promote growth in t young, immature animal and to pr tect health in the adult. The dair man who feeds good rations such have already been suggested in pr vious articles, need not worry abo vitamin A.

The second vitamin that may co cern dairymen is the fourth one d covered, commonly known as D, the antirachitic vitamin. Its ch function, so far as is known, is to pr mote the assimilation of minera particularly calcium and phosphor For this reason it prevents rickets young growing animals and osto porosis in mature animals that r large quantities of calcium as w heavy producing dairy cows.

The problem of mineral assimi tion is, therefore, closely linked with vitamin D in that the one su plies the actual mineral substan while the other promotes its stora and use in the cow's body. Good tions and the right kind of cow ma agement as have already been su gested under "minerals," usually ta care of the requirement for vi min D.

A third vitamin called X may ha something to do with feeding co It has to do with reproduction of t young. Too little is known about occurrence in dairy feeds to warra further statement.

The next article of the series wi conclude it with a summary of the i portant factors in calculating go rations and other factors that infl ence the efficiency of the feeds used

101 Wisconsin Grade Guernseys Sold for $15,200

The sale of grade Guernseys he January 18 at Waukesha, Wis., y Aplin & Benjamin and Geo. McKerrow & Sons Co. was a good one wh very fair prices for good grades. One hundred one grade cows and heifers of milking age brought $15,200, an average of just over $150 each. Ne head sold for $200 or over and on one under $100.

The top price of the sale was $10 for a 7-year-old springer that had n official record of 807 lbs. butterfat from 18,012 lbs. of milk. John A. Davis of Wisconsin purchased he with Geo. Hankinson of Pennsylvania, the largest buyer, the last contending bidder.

It is interesting to note that seven of the nine cows selling for $200 or more had production records.

1927 Dairy Cattle Congress Dates

Secretary Estel of the Dairy Cattle Congress at Waterloo, Ia., announces the dates for the 1927 show as September 26—October 2 inclusive.

Not His

"Did my wife speak at the meeting yesterday?"

"I don't know your wife, but there was a tall, trim lady who rose and said she could not find words to express her feelings!"

Smoking refreshment that never ends

WHY is it that the enjoyment of Camels never fails? That you can light them all day and far into the night with never a loss of smoothness, mildness and incomparable fragrance? It's simply a question of quality. Camels contain the choicest Turkish and Domestic tobaccos grown. Camels are given an expert blending found in no other cigarette.

First thing in the morning. Late at night. Before or after breakfast, lunch or dinner. Light Camels as liberally as you choose, one after the other, as often as you desire the cheering comfort of a cigarette. You will get always the refreshing thrill of smoking pleasure.

Camel perfection has resulted in a demand that has never been known before or since. There has never been cigarette popularity that could compare with Camel's. Each year, millions of experienced smokers, who are willing to pay any price for quality, find in Camels every good thing they've ever wanted in a cigarette.

Here's a smoke invitation that's leading millions to an entirely new conception of cigarette contentment and satisfaction—

"Have a Camel!"

Trailing Holsteins to South America

(Continued from page 115)

soundings as we advanced, and finding most of the time about six fathoms of water. A few miles out from Buenaventura, somebody was discovered coming toward us, paddling at a remarkable clip. By and by we met and it turned out to be the pilot, although you never would have guessed it. We slowed down so he and his assistant paddler could lash their dugout to the Humming Bird and come aboard the rope ladder that was already dangling over the side for their convenience.

The pilot was a little, old-looking body, of about 65 years I would judge—although ages in this country are deceiving—spectacled, barefooted, and quite disgusted because we had not waited until tomorrow to arrive. He said they did not expect us until *manana* and for that reason we should not have come till then. But no one argued with him and he did not refuse to pilot over the course of the channel so, I guess, his indignation must have died out.

Once the anchors were sunk in the black Colombian mud, the doctor came aboard. But not finding the contagion or rash on any, the yellow flag was allowed down. But not the Colombian; it stays on the foremast until we leave. Three customs men remain on the ship to, so far as I can see, save board ashore—a custom, Colombian. Together they took out their pistols and shot all their ammunition away, practicing on tin cans floating past the ship. The steward on the Humming Bird gets a bonus back in New York providing he can feed the crew under a certain figure, so naturally he is not pleased with their company.

We have some autos, corrugated roofiing, and barbed wire for the Colombians, 700 tons in all; but just how long it will take to discharge it nobody knows. And nobody ventures to guess and particularly those who have been in this port before. The rooms were out and the winches oiled; we were all set to begin unloading at 3 p. m., but something turned up ashore with the stevedores and the plans fell through. Now it will be *manana*.

December 29. Early the gangway was cluttered with hold-tarps, hatch-planks, strongbacks, cables, blocks, tackle, and negroes in miscellaneous number. These stevedores are broken-down black boys shipped down here from the mines in the interior to recover health and at same time be earning a stipend. They are a slow lot but of course the pay is no incentive to hurry, so there is really two sides to the question. But if the number of pieces of raiment they wear is any criterion of the relative cost of living, then you would say they don't need more pay. They came on the ship barefooted, barelegged, barebacked, and mostly bareheaded, many wearing just loin cloths. Again, some wear a necktie without a shirt.

These blacks are dull and simple and everybody takes advantage of them, we included. I have just dealt a raincoat without sleeves for two bunches of bananas, and if this *hombre* has any luck in the other fellow's banana plantation tonight, the exchange will take place in the morning. But ignorant as they are, they are not so thick that they have not contracted two of the white man's vices, namely, profanity—which is spoken fluently—and stealing. Everybody keeps his cabin door locked on board ship.

December 30. A gang of black boys tried to work at the cargo all night, but a deluge at 2 a. m. drove them to shelter, a good many congregating in front of my cabin. They talked and gabbled in Spanish which let me out on everything but the noise.

To bring this ship through the canal cost $6,200, or one dollar per cargo ton, which is quite a charge. But when you stop to consider that it would take three times that amount to steam it around the Horn, then it does not sound so unreasonable after all.

It is 3:30 p. m. and a great commotion has just taken place among the black boys. It is a conference on conditions; the barbed wire pricks their feet, so they have decided to knock off with the work for today, or till *manana*.

[EDITOR'S NOTE: This is the third of a series of six articles by Mr. Beattie. The next will appear in an early issue.]

Thermos Bottles on Wheels

HOARD'S DAIRYMAN:—Thermos bottle tanks on wheels, capable of hauling milk hundreds of miles through intense heat with only a two-degree rise in temperature, are being used by the Riverview dairy of Portland, Oregon. They are handling milk from the Woodland district in Southwestern Washington at a cost of 10 cents per 100 pounds as compared with 25 cents in ordinary cans. As a result, the Clarke-Cowlitz Dairymen's Association has a contract with Riverview under which it is more profitable to sell whole milk than to make cheese at its Woodland factory, and cheesemaking has just about been discontinued.

For milk cooled on the farm and again at the plant before loading into the 11,000 gallon tank wagons, the association receives 15 cents per pound butterfat above the highest Portland market price for sour cream, which for two years past has been much more satisfactory than cheese prices. The contract is binding upon the Portland distributor only during the latter half of each year. During the first half of each year it may have the association's surplus at the same price if desired.

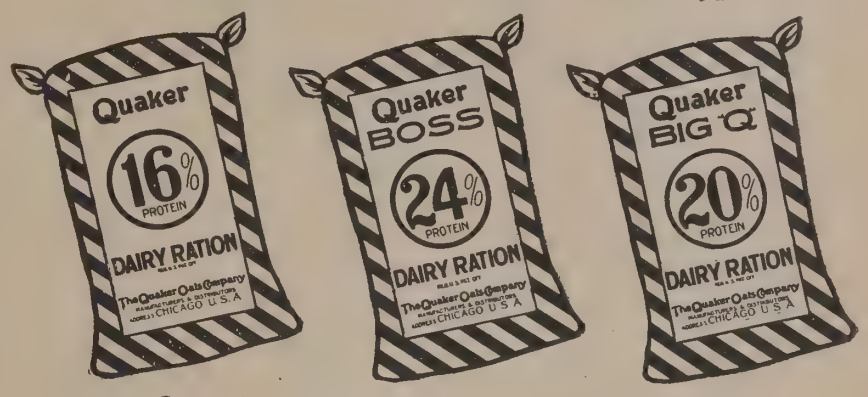
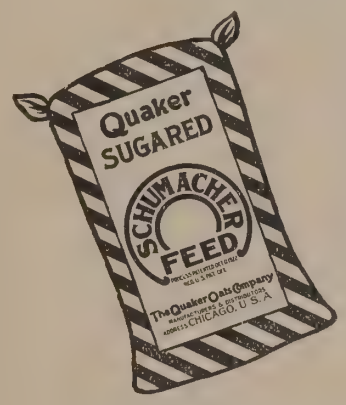
Coupon Will Bring You
Happiness and Success

ONG stretches of meadow land, green and fresh with the breath of the Atlantic upon it. Sprawling rivers, kissed by Carolina willows, exhaling a silent enchantment that grips the heart with its promise of peace and plenty. A country that knows Spring, refreshed in summer by cool East winds, warmed in winter by the kindly Gulf Stream, blessed with a natural beauty that never fades. Cattle graze peacefully along the splendid roads that lead to markets, to wide-awake towns, to excellent schools, to live churches. Rural telephone and electric lines radiate from New Bern throughout the country. The whole is a picture of success. This is the New Bern country, whispering to you of health, of wealth, of happiness. Obey that impulse. Mail the coupon NOW!



— Facts —
Average temperature of 62 degrees. Warm winters, cool summers. Fertile soil. Pure water. All-year grazing for cattle. A wealth of good roads and waterways. A splendid market for truck, live stock and dairy products. Competing railroads. Low priced land. Excellent School systems and churches. Friendly people—let us tell you the story without obligation.

NEW BERN, N.C.
CHAMBER of COMMERCE
The LAND of ENCHANTING WATERS



Select the feeds *that fit* YOUR farm YOUR herd

Dairy farms, and dairy herds, differ greatly. What's good for one herd may not be best for another. That's why Quaker offers a complete line of feeds, and helps you to determine exactly the combination that will give you best results.

Use prepared feeds. They save time and labor and insure a proper supply of minerals, vitamins and proteins. But use the feeds that meet your particular conditions.

One of these good rations, selected with consideration for the hay, and other roughage you have (or used with Quaker Sugared Schumacher) will give you a combination ideally suited to your conditions and herd.

Quaker Sugared Schumacher is the famous palatable and digestible carbohydrate feed. Our special process enables us to make this a dry, clean molasses feed that is easy to handle. Milch cows relish it. It may be used with one of the three Quaker high protein rations as the carbohydrate part of your feed. It is ideal for young stock, dry stock, horses, and swine, too.

Send for *free* book, *"The Dairy Herd."* It tells you just what you want to know about feeding and gives other valuable information on the management, breeding, and selection of dairy cows.

If your dealer does not handle Quaker Feeds write us direct for information on where you can obtain them.

BABY CHICKS

Unusual chicks—Peters-Certified now for the fourth season sent with a real guarantee to live. This insures that the chicks are properly hatched from healthy flocks and helps protect you against loss during the first two weeks which may occur if chicks are not delivered in perfect condition. We are a reliable organization of 250 successful poultry breeders and supply at very reasonable prices only chicks from our own Peters-Certified flocks having high egg production records. All popular breeds perfected in egg laying and health by our poultry specialist, A. G. Peters, as explained in our illustrated catalog supplied on request, which also tells how you can secure a complimentary copy of our valuable poultry book, "A Money-Making System of Poultry Breeding." PETERS-CERTIFIED POULTRY BREEDERS' ASSOCIATION. Just address Peters-Farm, Box 571, Newton, Ia. 2-*

Liberal Discount on Broiler Chicks—Get chicks for broilers that you can raise. We can supply left-overs from heavy, or light breeds from Peters' Certified Flocks. These are positively not culls, but big, strong, bright eyed chicks that grow rapidly. Order now. Big discount on orders booked early. These are exceptional values. 100% live delivery guaranteed. Write for catalog and price list. PETERS POULTRY FARM, Box 572, Newton, Iowa. 26-*

Pure Bred Chicks from high egg producing breeders. All breeders Hogan tested and strictly culled for correct size, type, color, and health; correctly mated for high egg production. Write for our new free "Poultry Profits" book containing valuable information for the poultry raiser. Liberal discount on all orders booked early. Pure bred chicks of all standard breeds for immediate delivery. WEDGEWOOD POULTRY FARM, Box 188, Pontiac, Ill. 3-*

Wanted—Man for general farm work. No boozer. HARRY BELL, Darlington, Wis.

Wanted—Married man to milk 50 cows, steady work. ADOLPH WHITNEY, Chino, Calif. 3-2

Protect Them Against Winter Chill

Cold or damp stall floors are not only decidedly dangerous to the health of your cows during the winter months, but they are frequently responsible for decreased production. Uncomfortable cows are invariably poor producers.

You can easily protect your herd against garget, rheumatism and other costly diseases and also increase your winter yield materially by flooring all stalls with Circle A Cork Brick. They make a warm, dry and sanitary floor that insures comfort and protection in all seasons. Circle A Cork Brick protect cattle against ground chill and dampness. They are non-absorbent and non-slippery, easy to lay, easy to clean—and they last for years.

The illustrated book, "Circle A Cork Brick" with a sample brick will be mailed free on request. Address ARMSTRONG CORK AND INSULATION COMPANY *(Division of Armstrong Cork Company)*, 112 Twenty-fourth Street, Pittsburgh, Pa.

Poultry on the Dairy Farm

Pays to Cull and Feed Right

HOARD'S DAIRYMAN:—F. J. Stevenson of Phelps County, Nebraska, is convinced that when one starts in the poultry game with well bred stock, culls rigidly, and pays particular attention to feeding, that there are good prospects for success.

As a vocational student at the state college of agriculture, Mr. Stevenson secured his first knowledge of poultry raising. He then purchased a 15-acre tract of land and 500 White Leghorns of good breeding. He kept accurate records and the first year his flock averaged 180 eggs each, and he had culled the flock from 500 to 380 birds.

All through the winter months oats are sprouted so that the hens will have an abundance of green feed. Besides a standard laying mash, buttermilk is purchased as a feed. The poultry yards are rotated each six months so that there will be clean ground for the flock. Rye is available each spring and until about July as forage for the fowls and then sudan grass in another lot is ready. Baby chicks, breeding stock, and broilers are all sold in season in addition to the eggs.

Nebraska. H. H. BIGGAR.

The American Hen

The poultry industry of the United States has been steadily coming into its present position of commercial importance since 1880, at which time poultry was first included in the farm census. The poultry industry, like other commercial and industrial developments, has followed very closely the increase and massing of our population in cities. The great increase which has taken place in the number of city dwellers has created an immense demand for the increased commercial production of poultry and eggs.

The poultry industry has developed during the past fifty years from a neglected side line on the average farm to a point where the farm yard flock has been increased in size, is better handled, and is considered by the farmer a very efficient contributor to his yearly income. Recent years have witnessed the establishment of thousands upon thousands of specialized poultry farms or commercialized henneries. These are found in the largest numbers near intensive centers of population where the demand for nearby high-quality eggs is ever present.

The great bulk of poultry and eggs produced in the United States comes from the Corn Belt States of the Upper Mississippi River Valley. There is a marked effort on the part of producers and shippers from this great poultry producing area to develop improved methods of distribution and thereby get their product into the market on a graded basis, in the shortest possible time, and of the finest quality.

During recent years, the Federal Census and figures from the United States Department of Agriculture show a marked increase in the number of chickens raised and in the number of eggs produced. In the years 1920—1924 the increase in chickens was 43% and the increase in egg productio 20%. This increase is steadily goin on year after year. These figure show that the poultry industry of th United States is keeping up with th ever increasing number of our peopl In 1920 the farm value of poultr products produced was more than on hundred million dollars greater tha the value of all cattle raised; mor than three hundred million dolla greater than the value of our entir wheat crop, and nearly four hundre million dollars greater than the valu of all fruits and fruit products pr duced. In fact, the estimated valu of poultry products is exceeded at th present time by only five other agr cultural commodities which are dairy, corn, cotton, hay and forag and swine.

It is true then that the America hen is a great national asset. She the producer of one of our most whol some and universally used huma foods; to say nothing of the gre volume of poultry meat which s produces. The American hen is ec nomically sound. A position of lea ership among our various agricultur commodities and the very satisfacto remuneration derived by farmers a poultry keepers is evidence of h economic position.

The American hen is a great cre tor of wealth. She is found in ever-i creasing numbers on practically eve American farm and is one of our mo universal sources of farm income.

During the recent World War it generally recognized that the Ame can hen saved the day for hundreds thousands of farmers in our big ag cultural states who, through crop fa ures, shortage of labor, and low pric were unable to carry on from the come from their normal crops but w were able as a result of increased re enues from the poultry flock to su cessfully weather the war period a the reconstruction days immediate following.

The American hen is a most e nomical producer of human fo There is no animal on the farm wh more efficiently manufactures a f ished product for human consumpti from the raw material which th consume than the hen. A little L horn hen, weighing around fo pounds, if well bred and well ma aged, will produce in a year a prod outside of her body in the form eggs weighing from twenty-five thirty pounds. To do this she v consume seventy-five to eighty pou of feed. Truly, the hen is a wonder machine.

The American hen is a universal vorite. It is a well recognized f that a far greater number of pers are interested in and actually c cerned with poultry than is the c in any other live stock industry. T back-lot poultry keeper, the fa poultry keeper, the commercial farmer, the exhibition and commer breeder, the baby chick producer but a few of the groups which help swell the ranks of the poultry fra nity.

The American hen is the safegu of the future. As our population c tinues to increase, as our populat tends to herd itself more and more to large cities, as our cheap graz

ds continue to disappear, we must, a nation, look more and more to t small animal unit as the source of o food supply. Our people must, o necessity, make poultry meat and gs an ever increasing part of their ly diet, if for no other reason than t fact that poultry husbandry lends itself readily to intensive methods a l limited areas.

The American hen is the producer o one of the greatest food products v ich has ever come down the ages. Te egg is one of our greatest pro- tive foods, being rich in the more iportant vitamins. Its greater use i the diet of old and young alike in- s es complete nourishment of the b ly and protects the human organ- is a against certain important nutri- t e deficiencies. The egg meat comes t us wrapped in a sealed container, t contents of which are untouched b the hand of man. Truly a wonder- f work of nature—truly a marvelous f d product!—National Poultry Council.

Despise Not Corn

HOARD'S DAIRYMAN:—Last winter v fed corn on the ear to a pen of s ne thirty Wyandotte pullets. It was s ply placed in the pen unshelled, a b shel or so at a time, and kept there t oughout the winter. The remain- d of our two hundred pullets were f in the usual manner, corn, oats, a l wheat furnishing the grain ra- n. All birds received green feed, e her cabbage, beets, or turnips, p ctically all winter. A standard l ing mash was fed in hoppers to all a ce and it was rather interesting to l rn when winter broke that the best e; yields had come from the pen w ich had had free access to whole c n. This pen was housed under the s e roof as the other birds. A spring c ck-up showed:

There had not been a single bird d d in the pen.

Percentage of production had been h her than any other pen.

Mash consumption per bird seemed a ut equal in all pens.

The corn pen had been practically free from colds. Roup developed among some of the other birds.

The birds receiving all of the corn they wanted were in better physical condition when spring came than other pullets in the house. Their eggs hatched just as well.

There is some difference of opinion even among authorities as to the value of corn as a poultry feed. One of Indiana's real producers uses two parts of corn meal to equal parts of other mash ingredients throughout the winter. About the last of February this is cut to one part.

After handling several thousand pullets, both our own and for others, I am convinced that rarely is a pullet too fat to lay. In fact, I doubt whether or not a pullet can be too fat to lay. Ninety-nine times out of a hundred it is not the fact that the pullet is fat that she fails to lay. It is a lack of protein feeds to make eggs *added to the fat making ration* that fails to fill the egg basket. Our problem has been in keeping the pullets fat enough on a ration calculated to produce eggs. That was our reason for giving free access to corn. Our corn was of the yellow variety in each case.

We are finding out that certain ailments generally attributed to colds and outside influences are due to malnutrition. Corn is not a cure-all but there is no doubt that a bird going into winter quarters in good flesh and kept in good flesh throughout the year will have greater disease resisting powers than one in poor flesh. Corn has the added value of being cheap, readily procurable, and is probably better relished by hens than any other grain.

The fact that corn for a long time was almost the sole feed for hens in the corn belt and as such was greatly criticised, is perhaps the reason we went off on the other extreme. This was also emphasized by the poor quality of the crop grown for two or three seasons—much of it failing to mature properly. Do not despise corn. Feed plenty of it, but feed good, solid, well matured corn. Then feed the protein mash to balance for eggs.

Indiana. W. C. SMITH.

Feeding and Care of Pullets

I have a flock of White Leghorn hens, mostly pullets, which I am feeding about 4 quarts of wheat and oats mixed in the morning and for mash equal parts ground oats 100 pounds, ground yellow hominy feed 100 pounds, flour middlings 100 pounds, wheat bran 100 pounds, which is before them all the time. For green feed I give them cabbage and potato peelings and sometimes I throw in part of a pumpkin or squash and at night they get about two-thirds corn and one-third barley or oats, enough to satisfy them.

My coop is 14 by 30, cement floor, and I also put in a dropping board to keep the litter from getting dirty. Am cleaning out about once a week and oftener if possible. I am only getting from 15 to 27 eggs from about 175 hens. They are getting about 3 gallons of skimmilk and all the clean water they can drink. Now if there is anything wrong in the feed and feeding please let me know as soon as possible. I also keep before them charcoal and oyster shells.

Sparta, Wis. H. B.

The ration which you have outlined here is only partly giving a diagnosis or giving the statement necessary for a proper diagnosis of the trouble in this flock, since the most important thing, which means the time of year when these pullets were hatched, has not been given. If the birds were hatched along in May it is, of course, understood that production from these birds could not be obtained until about this season of year. We have attempted to stress this a number of

304 Eggs in 365 Days

is another record that has just been credited to a ration containing

Diamond Corn Gluten Meal

Hen No. 8-5, a single comb-white leghorn pullet, bred and owned by Mr. Otto Ruehle of Ruehle's Sunnyside Farm, Pleasant Valley, N. Y., and tested at the State Institute of Applied Agriculture, Farmingdale, L. I., N. Y., during a laying contest which closed November 1st, 1926, actually laid 304 eggs in 365 days. This is the first official 300-egg hen in New York State.

Egg production of this sort cannot be achieved without the combination of a great bird and a great feed. In this test the Farmingdale Ration was used exclusively. This is the ration which has been recommended by the N. Y. State Institute of Applied Agriculture for the past two years. More than 15% of it consists of DIAMOND CORN GLUTEN MEAL. The complete formula follows:

100 lbs. Diamond Corn Gluten Meal	100 lbs. Meat Scraps
100 lbs. Wheat Bran	10 lbs. Fine Charcoal
100 lbs. Yellow Corn Meal	10 lbs. Steamed Bone Meal
100 lbs. Red Dog Flour	2½ lbs. Fine Dairy Salt
100 lbs. Hulled Ground Oats	2½ lbs. Powdered Sulphur

If you are taking care of a flock of poultry as your chief concern or as a sideline to your herd of cows, you will do well to consider DIAMOND as an economical egg-producing feed. DIAMOND contains 40% protein and is a lower priced feed than meat scraps or fish meal. Replacing one half of the animal feed in your ration with DIAMOND will do much to lower your feed bills and jack up production. If you are a dairyman, you've probably fed DIAMOND to your cows. If you haven't tried it with your hens, do so. You'll be glad you did.

MILLER'S "IDEAL" INCUBATORS HAVE PATENTED EGG TURNING TRAYS
Hartman gets 20% bigger hatch
Hartman says, "Miller's 'IDEAL' Incubator produces 20% bigger hatches than any three other machines." Love says, "Got a 91% hatch. Miller's 'IDEAL' Incubator beats them all." Austerman writes, "My 'IDEAL' Incubator after 25 years of use is still in good condition." For big hatches and testing service, no other incubator can compare with Miller's "IDEAL."
Saves Time-Increases Profits
Miller's Patented Egg Turning Trays save time and increase profits. A Pull of the handle and every egg on the tray is turned. This great invention and other patented features make Miller's "IDEAL" Incubators the biggest hatchers.
FULLY GUARANTEED
Our 38 years of experience and our own big testing hatchery enable us to build incubators which we can fully guarantee. Money refunded if you're not satisfied.

ways over and over again, that about six or seven months is required for proper growth and development of a bird, putting her into condition where we can start feeding her for egg production. If they are late hatched the growth is slower and more time is required before they will start producing than is the case where early hatching is practiced.

I don't believe that the first change would make a whole lot of difference, but I believe you would get better results if you mix the oats, the corn, and the wheat together in about the proportion of two of corn, two of wheat, and one of oats, using this as your scratch mixture both morning and night. If the birds are not matured and are not in good condition, the grain feeding should be heavy. If they are well matured and starting to comb out, then the amount of grain which you are giving to them should be cut down to not over four pounds per 100 birds in the morning and all of the grain feed which they will consume at night.

In your mash mixture you are not adding any animal protein feed, and the fact that you are giving the birds both milk and water to drink means that the milk consumption would naturally be rather low. I would advise that you cut the water out entirely, giving the birds only milk and if you do not have enough milk to last them through the entire day, that meat scrap or tankage be added to the mash mixture at the rate of about 10 or 15%. Even though a plentiful supply of milk is available it is still advisable for one to add about 5 or 10% of the meat scrap or tankage to the mash in order to increase the palatability of it, and as a result of that allow the birds to consume a larger amount of mash.

I would be rather led to believe that something is wrong with the ventilation in your coop when you find it necessary to clean it out once a week. I presume that this means in reference to the litter on the floor and not on the dropping boards.

I was in one of the houses which we are recommending in the state this week in a section where the temperature has been to 21 degrees below zero, and the litter in that house had been there for a little better than two months and it was still dry although it was, of course, becoming dirty. This, I believe, should be the only reason why we should be compelled to change the litter in a house, that is, the accumulation of dirt in the litter rather than dampness being responsible. If you do find that your house is damp as indicated by the necessity of changing the litter very often or the accumulation of the frost on the ceiling, this would be the first change for you to make.

In the second place I would advise you to cull out about 75 of the poorer hens or smaller, most immature pullets, and cut the flock down to the size which you should have. In a 14x30 building you have 420 square feet of floor space, which at the rate of three square feet to a bird means that it should carry 140 birds. I can probably allow you to run this up to 150, providing you have an exceptionally good bunch of birds, but even that means that a cull should be practiced at this time.

I experienced one of these problems here recently, when I was taken out to a man's farm. He was carrying a large number of birds and got only five or six eggs a day. I made a cull on them, removed about 45, and he still had too many birds in the house. As a result of that overcrowding, production had been at a low ebb.

Of course it is unnecessary to stress that windows should be opened to avail your flock of the sunlight and that alfalfa or clover chaff should be supplied to them for green feed.—J. B. HAYES.

Cod Liver Oil and Green Feeds

Some of the newer feeding recommendations will probably not be universally adopted. We must always consider local conditions or problems before adopting a given practice. What may be necessary in one part of the U. S. may not be required in another. This is a particular problem in housing, but some of the same limitations exist in respect to feeding.

All sections do not have a year round supply of sunshine. In some places it is necessary to adopt an artificial means of furnishing some of the value derived from direct sunlight.

One means by which this can be done is through the use of cod liver oil as a supplement. The value of this material is generally acknowledged. It at least has an influence on egg production, shell texture, market quality, and control of egg eating by better shell texture. Whether its use tends to improve hatchability may still be an open question.

In all of the northern states where our supply of winter sunshine is very limited and a high egg production is desired, this material is an essential. It acts as a generator to keep the producing pullet charged so that maximum production is possible without harmful effects.

There is still considerable to be known about the various kinds of cod liver oil. The most commonly accepted belief at this time is that the dark colored, sun extracted oil is lacking in Vitamin A, but carries D. On the other hand, the light colored contains both A and D.

It is relatively easy to supply A from some other source so that either kind will probably answer the purpose for which it is used. Even some producers claim that the dark may also carry A. This whole problem is so disrupted that one must take some parts for granted without conclusive proof or argument. The value of an oil is more dependent upon the reliability of the producer than on the particular source or color.

Under usual conditions 2% is recommended. This will mean the addition of 1 quart to every hundred pounds of dry mash. When used in this way, it is necessary to mix the oil with a limited amount of ground corn, by hand, and then combine this with the entire amount of mash. Mash consumption must be maintained at a relatively high level in order to assure a sufficient oil intake.

When milk is used as a drink it is possible to add the cod liver oil to the milk. Under such conditions it will require about 1 pint per hundred hens each week. The supply for the week can be added in small amounts each day.

Another means is adding the cod liver oil mixed with curd to the germinated oats or adding a few spoonsful to the moist mash each noon.

There are numerous means that can be utilized. One concern now has placed on the market a milk product to which the cod liver oil has been added. The feeding should start about November 1 and continue until spring. When used as 2% no flavor will be noticed in the eggs.

It is not advisable to depend entirely upon cod liver oil. One should also allow the flock the additional advantage of any direct sunlight by opening the windows whenever the sun is shining. The combination of sunlight and cod liver oil is preferable to oil used alone, there apparently being

ue value in sunlight not carried in
cod liver oil. This means direct
light not filtered through window
lss.

Considerable attention has been
ien to alfalfa as a winter green
ed. The value of this material is
endent upon the way in which it
a been cured. Alfalfa is an excel-
e source of minerals, but the vita-
n concerned with the assimilation
minerals and that takes the place
direct sunlight is found in the
reatest abundance in green and sun
ed alfalfa hay. One can use either
h leaves that fall off in the loft or
the feeding floor. It is also pos-
le to add good alfalfa meal to the
h in an amount not in excess of
%. Dry leaves will usually be
erable to moistened because one
pt to make a sloppy mash rather
h just adding enough water to
g out the color.

n interesting report from one of
Canadian stations gave some data
h may not be conclusive but at
t shows a possibility in connection
h green feed.

this experiment they used clover,
outed oats, mangels, and Epsom
ls. Both on cost of production and
a hability they found that Epsom
ls ranked second to clover and
s superior to the other materials.
lfa will probably be found
rior to the clover.

prouted oats have become a prob-
. One limitation to sprouting is a
ed room in which it can be done,
the second is the problem of
ding mold development. Ger-
ated oats have become more popu-
on that account. This process
verts the starches into sugar and
creases the palatability and feed
le of the oats. There is also less
ipment required.

ooden candy or lard pails with a
l and plug at the bottom are used.
h oats are soaked for 24 hours in
n water. The water is then
ned and the oats either changed
pail to pail or stirred. At least
each day and preferably twice,
oats are washed through with wa-
r. If any sourness is noted, the
ing is done more often.

st as soon as the oats germinate
e are ready for feeding. About
pounds of dry oats when germi-
ted is sufficient for 100 hens. This
mination of germinated oats, al-
a, and possibly an occasional dose
psom salts should supply the
en feed and succulent needs of a
c adequately. When, however, a
on has mangels or cabbage for
ock they should be used. It
s possible to supply green feed
amount that will tend to limit
mash consumption. There should
aintained a proper balance.

I seems, however, that the germi-
ted oats are more easily produced
d satisfactory than sprouting. This
s alternate offered to those hav-
g trouble in sprouting.

It is not assumed that a person
ould try to eliminate green feed
d depend upon Epsom salts. This
periment does tend to show, how-
er, that when a decided shortage
green feeds exists and it is im-
sible to germinate oats, that salts
n be given regularly. The use of
em would tend to keep the flock in
tter physical condition.

God alfalfa can supply at least a
erful source of mineral. What
obtained from mangels, other than
ccident, is indefinite. Any flock
er with a supply of alfalfa, for
the hens or chicks, has an excel-
nt material which may be more gen-
ally used. It is fortunate that the
ply of this is increasing each year.
Some of the methods that we have
em following are still found to be
actical. In some instances we are
just finding the reason for some of the things that we do. When certain known requirements must be met, certain practices must be adopted.—J. B. HAYES.

Ration for Pullets

Please fix me up a good fattening ration for pullets. We have corn, oats, oil meal. Can get tankage for $3 per 100; have alfalfa. Also have skimmilk. Your suggestion will be very much appreciated."

Sherburn, Minn. W. B.

The first sentence undoubtedly does not mean what it says, since I cannot understand why anyone would wish to obtain a ration for fattening pullets. When we think of a fattening ration it is always in connection with market stock; pullets, of course, are too valuable to be used for that purpose unless they are a bunch of discards one wishes to dispose of.

A fattening ration to be used in a fattening battery consists of about 60 of ground corn, 30 of standard wheat middlings, and 10 of low grade flour, mixed with just enough buttermilk to bring it to the consistency of cream or whitewash, and this is fed twice a day with the birds kept in very close confinement.

What I think is meant in this case is a ration which will bring the pullets through in proper condition in the fall of the year to go into the laying house.

When pullets are pretty well matured, along towards fall one wishes to get a good reserve established on those birds in order to have them in a condition comparable to the dairy cow that is going on to a test. The fat which is established on her body acts as a reserve on which she can draw during the time of heavy production and aids considerably in allowing her to carry on a sustained production.

Unless a bird is properly conditioned and kept in that condition during the year, she will also usually go into a winter moult that ruins the winter production.

A scratch mixture in this case can be made of about three of corn and one of oats. If it was possible to obtain some wheat, that would improve the scratch feed materially.

For a mash mixture one can use 100 lbs. of ground corn, 100 lbs. ground oats, 100 of wheat bran, 100 of standard middlings, 50 of high grade digester tankage, and all the milk that the birds will drink. In addition, the alfalfa can be fed to them in a rack, allowing the birds to pick off the leafy portion, or if it is possible to put this through a hammer mill, meal then can be added at the rate of about 5%. Alfalfa is and is becoming a very important part of the ration for poultry, providing the alfalfa has been properly cured.

Early in the season the scratch grain should be fed rather heavily to get them in good physical condition without forcing them to consume any great proportion of mash.

However, when they get into the house and get matured enough, so the production should start, one can then gradually decrease the amount of grain, which will automatically raise the mash consumption and throw the birds over from growth into production. From that time on the proportion of grain to mash should be controlled by the production and the weight of the birds.

Oil meal is not necessary in the ration for hens. You have plenty of vegetable protein there, and it is the animal protein that we are particularly interested in. Oil meal tends to raise the cost of the ration without improving the results, materially.—J. B. HAYES.

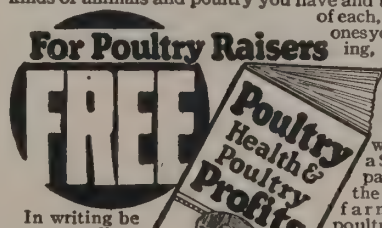
Why We Know B-K is Effective in Fighting Roup

and other poultry diseases

such as **canker, poultry flu**



also **white diarrhea, dysentery**

and similar diseases that kill baby chicks

Our recommendation of B-K for the prevention and control of poultry diseases is based on the records and experience of over fifteen years. It has been tested under the most severe and varying condition found right on the farms and also in laboratory work, in connection with same. It's a common sight here to see one of our chemists speed off in his car on his way to some farm where there is poultry disease. He is likely to bring back some of the sick birds for treatment, or maybe dead birds for dissection. We do not guess as to causes but determine them by the exact condition of the organs under the microscope. There can usually be found in our laboratory hundreds of birds on test, both diseased and well.

A Book You Should Have

Contains a wealth of important information on questions of selection, breeding, feeding, and of the sanitary care of poultry and live stock. It is based on accurate and complete information and a mighty valuable book to have. Write for copy. If you will write us the different kinds of animals and poultry you have and the number of each, also which ones you are pushing, we will be glad to send you a copy of this booklet, *Free*. Also we maintain a Service Department for the benefit of farmers and poultrymen, and our advice and counsel can be had at any time free on request.

In writing be sure to tell us your troubles clearly, so that we can get right at the point and give you our best service.

GENERAL LABORATORIES, Dept. 101B Madison, Wis.

You can avoid loss by using

B-K Bacillus-K

CHICKEN COLDS

"During the past season, while casualties among poultry were very heavy, we were very fortunate in escaping the scourge, and B-K played an important part in keeping our station free from disease. Continuous spraying of our equipment and the birds with B-K, also feeding B-K in the water, turned the trick. Believe us when we say we are thoroughly sold on B-K."
—The Lovett & Davis Produce Co., —, Iowa.

WHITE DIARRHEA

"Before I got B-K, I lost 245 baby chicks with white diarrhea, out of a hatch of 263. After I started using B-K, I never lost another. I had used other remedies, but got no results until I got B-K; then the trouble stopped. My neighbor's chickens got cholera. Seven had died. We started using B-K and no more died. I will never start a hatch again without B-K. I keep it on hand now. Others will do the same after they try it once."
G. A. Phillips, —, Pa.

Condition your cows for calving

LET us not forget that the modern cow is a dual purpose cow.

From the time she freshens, we ask her to work her highly organized system not only in the production of a yield of milk that will return a good profit for ten months—

But remember, at the same time, this cow has another important function to perform. In order that she may produce the maximum profit, we also ask her to develop a strong fetus and bring forth a vigorous calf every twelve months—not eighteen. She needs help—outside help—elements that are lacking in the ration, no matter how well balanced it may be.

Dr. Hess Improved Stock Tonic supplies these elements in the correct proportions.

Potassium Iodide. This element, seriously lacking in the feed, has a direct action on the glands, and during the long period while the cow is carrying her calf it assists in developing a strong, healthy fetus and a better offspring. It helps to prevent goiter or "big neck," lumpy jaw, garget, milk fever and many growing evils.

Calcium Carbonate. A constituent of milk and of great importance as a bone builder. Especially valuable in the proper development of the fetus and the production of normal, fully developed calves. During the milking period a greater supply of this mineral is required than can be had from ordinary feed.

Calcium Phosphate. This mineral is one of the most essential constituents of the animal body. The bones are approximately 50 per cent calcium phosphate. In addition to its great value as a bone builder it is essential for its action on the muscles, its control on the nerves and proper condition of the blood. No ration is properly balanced for efficient breeding that is deficient in this important element.

Dr. Hess Improved Stock Tonic is the same reliable appetizer, laxative and diuretic that it has always been, with these valuable minerals added. No getting off on feed, no clogging of the system, not where Dr. Hess Improved Stock Tonic has been added to the ration.

Our offer to the man with cows

Go to your dealer and get sufficient Dr. Hess Improved Stock Tonic to last your cows 30 days—25 lbs. for every 5 cows. Feed according to directions. If you do not find it a great help in conditioning your cows for calving, if it does not give you stronger, better calves, and if you are not thoroughly convinced it pays you well to use it, simply return the empty containers to the dealer and he will refund your money or cancel the charge. We reimburse the dealer.

The Right Thing at the Right Time

IN playing a football game accurate timing of every movement in each play is essential to success. Likewise in successfully rearing pigs accurate timing of the essential factors that promote the well being of pigs is necessary if the owner would safeguard the depletion of his pocketbook.

One cannot make a market hog out of a pig that dies before it has a chance to be weaned; one cannot even salvage the cost of producing such a pig. Furthermore, it is difficult and frequently impossible to make a profitable market hog out of a pig that has to fight its own way through parasite and disease hazards. All of which suggests that there is a time to do certain important things for the welfare of young pigs. It is not too early to suggest the things that must be done soon if producers are enabled to go to market next fall with money-making hogs.

The number of pigs farrowed this spring cannot now be increased. The number saved and kept free from parasite and disease infection up to weaning time is still partly in the control of the owners.

The time to put the sow in good condition is before she farrows and not afterwards.

The time to reduce the feverishness and avoid constipation is before a sow farrows and not a week afterwards. Two or three days before the sow is due, substitute a laxative slop made of equal parts of bran, shorts, and ground oats and reduce the amount of feed. Give plenty of water. If the weather is cold give warm water. Continue the reduced laxative ration for five or six days after the sow farrows, then gradually bring her up to a satisfied appetite on the ration to be used. A good one for this purpose is composed of 50 parts corn or ground barley, 30 parts shorts, 10 parts tankage, 10 parts linseed meal. Skimmilk may be substituted for the linseed meal and tankage, feeding about two and one-half pounds for each pound of grain fed. Until grass comes feed alfalfa hay in a rack.

The time to clean out the farrowing pen and wash off the sow is before she farrows and not afterwards. Little pigs farrowed in dirty, infected pens cannot escape some disaster. In cleaning the pens one should first remove all loose dirt with a stiff broom. The walls and partitions should be cleaned—and the cobwebs swept down and out with the dirt. Following this the floors and sides of the pens should be scrubbed with boiling hot water in which one pound of lye has been added to 30 gallons of water. After the pens are thus cleaned and dried, no hogs should be allowed in them until the sows that are to farrow are ready to go in. Before the sows are put in they should be scrubbed off with warm water and soap. The bedding that goes into each pen should be new and not contaminated. Thereafter such bedding as is used should likewise be clean and the one who cares for the sows should avoid carrying contamination from the infected yards into these clean pens.

The time to put in a guard rail is before a nice litter of pigs is smashed and not afterwards. These guards are not expensive and they are easily put in. Their cost is insignificant in comparison with the service they render.

The time to be around the farrowing pens is when the pigs are being born and not a day or twelve hours afterwards. Reviving a weak or chilled pig is, of course, frequently necessary under the best of conditions but it is less frequently necessary when the owner is on the job at the right time. Quietly one can guide the little pigs into paths they should go and help to dry them and warm them. Quietly one can keep them from getting tangled up in the straw.

Some sows have very decided notions about the kind of beds they should make; they frequently change their minds while the pigs are being born; they have peculiar notions about their housekeeping after the pigs are born. The skilled caretaker observes all these peculiarities and is on hand to protect the helpless pigs.

The right time to prevent worms, necro of the face and nose, and enteritis of the intestines is between the time the pigs are born and before they are turned out to run with their dams. Just as sure as one turns them out at this age into infected yards just so sure will they become more or less infected. Curing these difficulties after they are started is not only a costly method but often a hopeless task. When the pigs are old enough to leave the place where they were born lock up all the gates to the old, infected yards and provide the pigs and their dams a new, clean place to live until the pigs are about four months old. Then they will go on and make hogs of themselves—the kind of market hogs every producer is proud of—the kind that makes money instead of losing it.

The foregoing practice is recommended because it works. It has been tried out by thousands of swine producers who formerly were paying out thousands of dollars annually for cures and getting nowhere with them.

Only half doing the job is to invite failure. It is just like the full-back fumbling the ball in an otherwise perfect play. Doing all the right things at the right time is the only way the system of management outlined will produce clean, healthy, money-making hogs. Try it.

These pigs have made their owner proud of them. They have not done it alone. Their owner gave them a fair chance to make hogs of themselves because he did the right things at the right time. To be proud of a bunch of pigs next fall is to be punctual this spring.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Congenital Epithelial Defect

It is now fairly well understood by dairymen that goiter and hairlessness of new-born animals are closely related and that lack of iodine in the system is, at least, a contributing cause. They are also aware that complete feeding of the pregnant dam, enforcing daily exercise, exposure to direct sunlight, sanitary housing, and the administration of small quantities of potassium or sodium iodide make goiter and the hairless condition practically unknown. It is likewise a fact that lack of iodine in the system and ration may have much to do with the weak, puny, and sickly condition of newborn animals of all kinds, although either goiter nor hairlessness are evident. It is therefore getting to be a general practice to include in all mineral mixtures for live stock, small quantities of one or other of the iodine salts mentioned. That practice is based largely on supposition, perhaps, but the iodine will not do any harm in small quantities and very likely may do some good. We should favor the use of iodine in that way, on general principles, and it certainly has to be given when goiter and hairlessness have been prevalent.

There is another congenital defect or disease of the new-born calf which, however, remains a mystery and is being investigated by a few veterinary scientists. We refer to that peculiar condition sometimes met with at birth in which the calf lacks skin or epithelium on its legs, from the feet part way to the knees and hocks. The mucous membranes of the mouth may also be deficient so that the mouth looks "raw" and may be so sore that the calf does not nurse. The affected calves are not so-called "living abortions" but have been carried full time, nor does the disease seem closely related to the contagious abortion disease or due to any specific germ that, so far as we are aware, has been isolated. There seems to be a possibility, however, that the disease may prove to be associated with malnutrition or deficiency in nutrients and also a likelihood that it may "run in families," so that tendency to it is transmissible.

One observer says of the disease: "Areas of various size and irregular in outline on the legs, muzzle, tongue, and cheeks appeared to be entirely denuded. It seems that the skin and mucous membrane had never formed or united over these areas. The affected calves were carried full term and the cows were in prime physical condition. The calves were weak and listless; some could not get up or stand when lifted to their feet. So far we have not succeeded in saving any, although vaseline was applied at frequent intervals to protect the raw surfaces. One calf lived several weeks but it did not improve, so was destroyed as worthless." Another breeder, in whose herd several affected calves had been dropped, reported that only one showed signs of having goiter, although a number of other calves were affected with goiter. In his herd the affected calves appeared as if the skin had peeled off, more or less, from around the mouth, also from the ears, and the legs were hairless from the knee down. The ears were somewhat deformed. The affected calves were born alive but were weak and unable to stand.

Any reader who has had calves dropped in his herd that showed symptoms like those described would do well to communicate with Dr. F. B. Hadley, chairman of the Veterinary Department of the Agricultural Experiment Station of Wisconsin, at Madison, as he is investigating the disease.

Drying Up Cow

HOARD'S DAIRYMAN:—Here is my opinion of the proper way to dry up a cow: There are two factors that tend to check secretion of milk; first, withholding feed; and second, allowing the udder to become distended with milk.

Much can be done toward checking secretion without materially reducing the supply of nutrients This is accomplished by feeding dry fodder instead of succulent feeds. If this course is followed a cow may be fed at least three-quarters of her usual grain ration and there will be no marked tendency to keep up the milk flow. In selecting grains at this time to be fed, it is important to choose those that do not tend to stimulate milk production. Ground oats and a small quantity of corn are satisfactory. But the grain ration should be

hat a satisfaction to go down the line at lking time—every cow without a trace of re teats or udder. No hard milking; no loss milk through restlessness and discomfort.

Bag Balm, the great healing ointment is mpounded especially to keep in perfect lth the delicate tissues of the udder and ts. It shortens the labor of milking by eping the teats soft, silky, pliable.

For Caked Bag, Bunches, Inflammation, Sore ats, teats cracked or chapped, stepped on, f any injury or cut, Bag Balm heals quickly. en the healing is accomplished between nkings. Clean and pleasant to use—cannot taint the milk. Has hundreds of uses on t farm.

A Stirring Message to Feeders

I want to render a service to every forward-looking livestock feeder in America by sending him a copy of this remarkable book absolutely free. It is not an advertising pamphlet, but a simply-worded handbook for livestock feeders, dairymen and poultry raisers, telling them how to select feeds for producing more milk, more pork, more eggs and quicker, bigger profits. It is written by that master authority, Prof. John M. Evvard, of the Iowa Agricultural Experiment Station. It is, in fact,

A Plain, Practical Farmer's Book

Written in plain words. Easy to understand, yet explaining the most important developments of the age in the feeding and management of livestock. *What to feed and what not to feed* growing livestock for healthier, faster development, bigger production and Better Profits with less feed. Page after page of interesting, instructive questions and answers on minerals and feeding.

INSURE— *Health and Profits*

ARE you killing your cows with kindness? Are you wasting good feed dollars in ineffective attempts to force production? Too much heavy, rich, expensive rations that the overworked digestive and assimilating organs cannot convert into milk makes your cows logy, off feed—the easy prey of disease.

Kow-Kare, used with the winter feed, shows such amazing milk gains simply because it actively aids the digestive organs, stimulates assimilation—builds natural health and vigor right where the milk-making process occurs. Kow-Kare is not in itself a food. It throws no added burden on the cow's digestive functions. Its action is not temporary—but PERMANENT. It invigorates the productive process—makes the cow thrive on the less expensive NATURAL foods.

Gear up your cows to higher milk yields right now. It costs you nothing to give your cows this vital help. The added milk much more than pays the slight cost. You get cow-health insurance as a BONUS. A single can of Kow-Kare will ration a cow one to two months. Full directions are on every can.

Prevent Disease Losses

Most cow diseases are prevented entirely where Kow-Kare is used with regularity. By keeping the cow's vitality at a high level expensive cow troubles cannot gain a foothold. When disorders such as Barrenness, Retained Afterbirth, Abortion, Bunches, Scours, Lost Appetite, etc., do creep in, Kow-Kare brings speedy recovery by restoring the health and vigor of the organs where these troubles always originate. Kow-Kare rescues many a hopeless cow—turns many a loss into profit.

Feed dealers, general stores, druggists have Kow-Kare—$1.25 and 65c sizes, (six large cans, $6.25). Full directions on the can. Mail orders sent postpaid if your dealer is not supplied. Our valuable free book on cow diseases sent free, on request.

When Cows FRESHEN

no investment is so certain to pay big returns as giving Kow-Kare. Instead of *expecting* trouble at calving you prevent it with this great invigorator. Thousands of dairymen no longer think of letting cows freshen without the aid of Kow-Kare—fed two to three weeks before and after. It assures a healthy vigorous cow and calf.

increased again as soon as the milk secretion has ceased.

A course that has been found satisfactory is to milk the cow once a day instead of twice a day, for three days. This will ordinarily reduce the milk flow about one-half; that is, at the end of the third day she will be giving about the same quantity at a single milking that she was giving at a single milking when she was milked twice a day.

The cow should now be milked at irregular intervals and the condition of the udder watched carefully. When the udder has become fully distended all the milk must be drawn out and the organ allowed to become distended again and, if possible, permitted to remain so for a longer time than before. When milked, all the milk should be drawn out.

Usually a cow can be dried off within two weeks by this method, but the udder should be watched carefully for some time after this, and if the udder fills up, as it sometimes will, it should be milked out.

Washington. A. B. YOUNG.

Nympthomania

We have a cow in our herd that has violently been in heat every day for about a month. For the past two weeks she has had the attention of a graduate veterinarian and does not seem to improve. An examination of her ovaries shows them normal, but there is some pus and discharge and apparently inflammation in the uterus or womb. We have thoroughly disinfected several times. She is a very good cow and we are wondering if you have experience with such stubborn cases and can give us advice. Would such a condition result from improper feeding or is it a contagious germ trouble? Would minerals be a benefit to such trouble?

Fort Wayne, Ind. C. B. M.

The diseased condition of the womb (endometritis or pyometritis) is germ-caused and possibly associated with presence of the contagious abortion disease. A sample of the blood might be tested to determine whether the cow is so affected. In such cases of nymphomania or persistent heat the ovaries are almost invariably diseased. Chances of recovery are poor. It will be necessary for the veterinarian to treat the womb with antiseptic solutions at least once a week by means of return-flow catheters, etc. He should also massage the ovaries to rupture cysts and dislodge persistent "yellow bodies." The cow should be kept isolated.

Abortion Infection

My brother and I live on farms joining and have always used the same sire. We would each lose a few calves from abortion each year. We keep from 12 to 18 cows each. Now I have not lost a calf for over a year and this fall and winter my brother's cows are most all losing their calves. I have had trouble getting some of the cows with calf and sold two last fall that would not breed. One of them had aborted before and the other one never had aborted. Do you think my cattle have become immune to the disease? Is the disease transmitted by the bull? Do you consider it dangerous for us to continue using the same bull?

Barron, Wis. J. J. B.

Cows that have aborted several times may become immune so that they carry calves full time, but they may remain infected and be capable of infecting susceptible cows and heifers by their vaginal discharges contaminating feed. To determine which cows are affected you should have a sample of blood from each of them tested at the state experiment station, veterinary department, at Madison. Your veterinarian can attend to that. While the bull is no longer considered a fertile source of infection it would be unwise to let your bull serve other cows than those of your own herd. Keep them isolated and bring your own cows to him for service. To control the disease, follow the instructions given in a bulletin on abortion which you can obtain from the experiment station.

Old Pipe-Smoker Switches Back to Favorite Tobacc

Having tried other brands, l returns to his old favorite with new appreciation

Evidently, one way to appreciate certain tobacco is to try another ki

At least, that has been the expe ence of one veteran pipe-smoker. switching temporarily to other tob co he finally came back to his old-ti favorite with a new appreciation a vow never to change again.

It is significant that this pipe-sm er found that his former favorite bacco still had the same flavor quality that first won him to it. A matter of fact, most pipe-lovers kn that Edgeworth never changes.

Wisconsin's Earliest Cow Tester

(Continued from page 114)

fieldman or tester. However, our faith was shattered as the farmers had so much work to do that they neglected to take samples regularly, especially when old "bossy" got to giving a small flow of milk.

"We operated about thirty associations under this plan up to the year 1909 when we gave them over and adopted the government plan of placing a competent man in the field who would go directly to the farm, weigh and sample the milk, weigh the feed, and complete the work at each patron's home.

Change System of Charging

"When we started work under the government plan, the price for testing was $1.00 per cow per year. This method of charging did not work well with us because we had to make a canvas. If we secured 400 cows from 26 farmers all was well and good for we could then pay $400 to our tester or fieldman. However, we found that farmers would not sign up all of their cows. Some would say, "Well, there are five or six cows in my herd that I must sell, so I'll not put them on test." When Neighbor Jones saw that Neighbor Smith signed only 15 of his 20 cows, he would follow the same kind of a scheme.

"A kind old farmer near Wausau gave me a tip on the flat rate plan when I was working hard in his neighborhood to get an association under way. This old gentleman said, 'Searles, I have only seven cows in my herd, but if you can possibly start the association I will stand for one day's wage of the tester each month." Those words soaked in pretty sudden and I started at once to organize on a flat rate of so much per day, with the provision that farmers could test up to 30 cows without extra charges since a tester could handle that number for a day's work. The latter plan has proved very satisfactory so we have never cared to change to any other system."

Government records do not give Wisconsin credit for her first regular cow testing association of 26 members because no fee was charged the farmers. "Moreover," says Searles, "after the first year we did not accept the government plan of placing a field man in each association to go to the home of each member one day each month, but we allowed each farmer to take his own samples. This, I suppose, was another reason for not allowing us credit for our work, but then we never asked it to give us credit."

This, then, is an account of one of the early attempts to improve dairying at its source. It will probably be many generations before the true worth of the Wisconsin Dairymen's Association will be fully appreciated, but it was largely because of the efforts of such directors as J. Q. Emery, Ex-governor Hoard, General George Burchard of Ft. Atkinson, A. D. DeLand of Sheboygan, C. P. Goodrich of Fort Atkinson, E. C. Jacobs of Elk Mound, H. C. Taylor of Orfordville, Chas. Everett of Racine Chas. Hill and F. H. Scribner of Rosendale, and others of their caliber who were guiding the destinies of the association at that time that Wisconsin has been able to take and maintain her lead in the dairy world.

H. C. Searles will probably continue his task of organizing cow testing associations for many years to come, for, full of the worth of his mission, he says, "There is no line of extension work carried on in the United States that is doing the amount of good as is that done by cow testing associations."

Buy that herd bull from a Hoard's Dairyman advertiser. You'll be better satisfied.

It is written over every farm where Ayrshires are owned. Modern barns, cheerful homes, and well-deserved recreation are found on the farms where Ayrshires lighten the cares and increase the bank balances. The net profits from these herds have sent children through school, bought radios and paid for mother's new electric washer,

These farmers have learned that their Ayrshires produce at the lowest feed cost. They are sure that their hardiness helps them to thrive under all conditions. They know that their 4% Aryshire milk is a premium product.

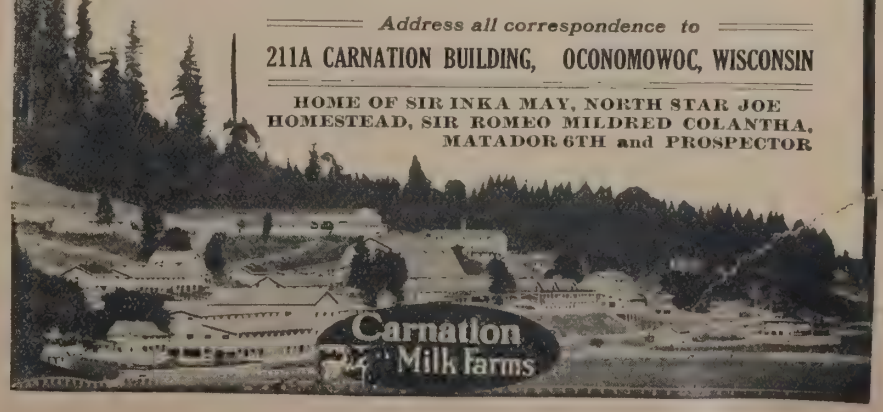
Write for new booklets.

May we help you locate a Foundation Herd?

AYRSHIRE BREEDERS' ASSOCIATION, 10 Center Street BRANDON, VERMONT

NORTH STAR JOE HOMESTEAD
Senior Herd Sire—Carnation Milk Farms

Now *you* can own a son of "Joe"



Some dairymen have said, "My greatest ambition is to own a son of North Star Joe Homestead, but I can't afford it."

Just now we have a son of "Joe" we can offer at $175. We also have a few other very desirable youngsters from $150 to $300. You will appreciate that there will be mighty few opportunities like this. Let us tell you about it.

Waukesha and Watertown

THE WALCOWIS HERD

Owned by Louise H. Dickinson, Lake Geneva, Wis.

60 REGISTERED HOLSTEINS

Including—12 daughters of Iowana Sir Ollie, that great bull that was grand champion at the National and full brother to a bull that was twice a National grand champion. He was a sire of producers as well as of show animals.
50 granddaughters of Iowana Sir Ollie, among them:
10 daughters of Sir Ollie Mooie Watson, a 36-lb. son of Iowana Sir Ollie.
22 daughters of North Star Gift Champion, a son of Johanna Bonheur Champion from that former world record cow, Little Gift of Spring Valley.
The Herd Sires—North Star Gift Champion and Walcowis Ollie Denver, will be sold.
You know the herd. It has long been one of the best in the state.

J. W. HOWARD'S HERD

Genesee, Wis. — 30 Registered Holsteins

Including—8 daughters of Pabst Champion Hartog, an 800-lb. son of King Pontiac Champion.
4 granddaughters of Terracelawn Hengerveld Segis, whose daughters twice won the get of sire class at the National Dairy Show.
5 granddaughters of Woodcroft Perfection, the 40-lb. bull.
This is a high class herd of producers, cattle that should interest those who want to add some of the profit making kind to their herds.

O'Connor Bros. Holsteins

Watertown, Wis.— 60 HEAD

This herd was built entirely on a Homestead foundation. It is one of the oldest and best herds in Dodge County. It includes
26 daughters of Carnation Johanna Matador, a son of Matador Segis Walker. 20 daughters of Colantha Walker Segis, a son of Carnation Segis Prospect. One expects good cattle from such breeding and this is a herd of good ones.

The Lauritz Larsen Herd

From Elroy, Wis. — 35 Good Holsteins 35

A Herd that Includes . .
- 15 GOOD COWS.
- 5 TWO-YEAR-OLD HEIFERS.
- 6 YEARLING HEIFERS.
- 8 HEIFER CALVES.

These are practically all daughters and granddaughters of semi-official record cows and among them are 2 daughters of a 900-lb. cow. These are the kind of cattle every good dairyman likes to have. The entire herd is largely of Admiral Walker Prilly breeding.

All Herds Federal Accredited and sold on a 60-day retest.

Holsteins--
Producers of Cash

Holsteins stand supreme as butterfat producers. Holsteins in most instances are leaders in cow testing associations both in individual and herd records. Under official test the important records for butterfat are all held by Holsteins. Their ability to produce butterfat, milk and calves economically, make them consistent producers of cash.

The Surge Milker

Which would YOU rather wash?

ANY salesman will tell you that his milker is easy to clean *but* — he is not going to be there to wash it for you. You have to do that yourself. So why not judge for yourself! Don't buy any milker until *you* have taken it all apart, washed it thoroughly, and then put it all back together again. When you have done that a few times you'll know—and not until then! Once you you have washed The Surge Milker you will not be interested in an old-fashioned milking machine with a lot of rubber tubing and twisted claws to wash. Don't just take our word for it — *try it!*

Above you see an old-fashioned milking machine with claws and long tubes. Look at the chances for bacteria—"bugs"! The milk washes around in the teat cup and then flows past several joints into the claw. By this time it has probably gathered a good many bugs. But the worst is yet to come—the trip through the long milk tube—3 feet of constant exposure to bacteria! Finally the milk reaches the pail after having washed 4 feet of rubber. Contrast that with The Surge Milker shown to the left above. NO Claws! NO Long Tubes! Milk travels ONLY 4 scant inches from teat to pail. A short, direct, *clean* route!

The Surge Milker

The Surge Milker is EASY to clean. NO claws! NO Long Tubes! It can be taken ALL apart, easily, in 20 seconds, washed in 3 minutes and assembled in 30 seconds. *Because* The Surge is so easy to clean it IS washed after every milking as it should be. *It is not neglected.* That's why average farms under average conditions are producing clean milk every day with The Surge. And that's why we guarantee clean milk and premium prices with The Surge.

Bear this in mind: To produce *clean* milk ANY milker must be taken ALL apart and washed *clean* every day. Mere rinsing, dipping in sterilizing solution or sucking water or sterilizing solution through by means of any "circulation system" is NOT ENOUGH! That's why we say—before you buy any milker be sure to see how much of a job it is to wash and clean!

Read This:—"I have used . . . . and . . . . machines (*both* Long Tube Claw-Type Milkers). I find The Surge *far easier* to keep clean, and I can produce a higher quality of milk."—G. Schmidt, Lenexa, Kansas.

No milker with long tubes and claws *can* be as easy to clean as The Surge. Surge owners never have any bacteria trouble. They get premium prices every day for their milk. Don't buy any milker until you have seen the famous "Easy-to-Clean" Surge Milker.

HOARD'S DAIRYMAN

A JOURNAL DEVOTED TO DAIRY FARMING

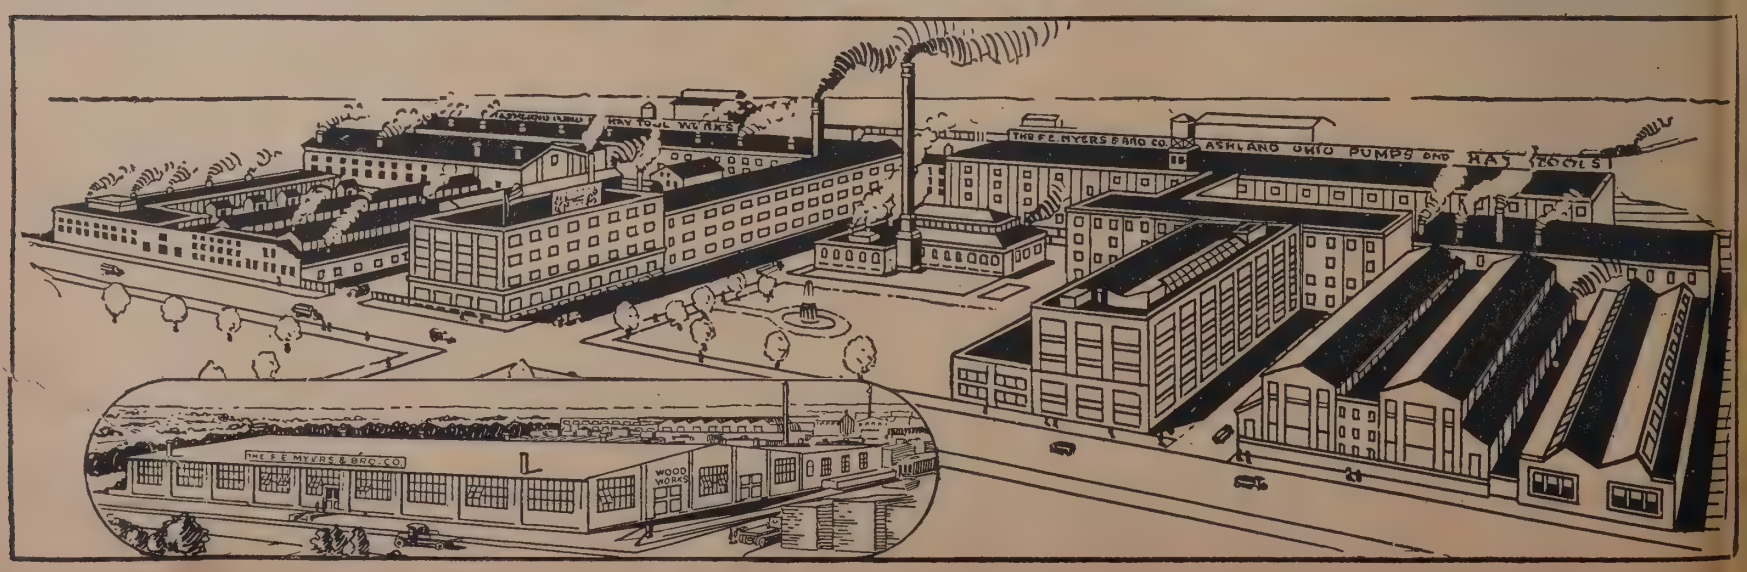
Volume 72, No. 4 Fort Atkinson, Wisconsin February 25, 1927

A Guarantee of Reliable Service
—Known to Farmers Everywhere Since 1870

FOR more than half a century the name Myers has been an unfailing symbol of dependable service. Your grandfather and quite possibly your father's grandfather had complete confidence in the Myers, "The Best Pump Built!" Down through the years the quaint old trade-mark showing the mischievous girl and the hatless youth has always been associated with *products of outstanding quality and value.* And today Myers Pumps for Every Purpose, Myers Water Systems, Myers Hay Tools and Myers Door Hangers are unquestionably the leaders in their field.

A Living Trust That Charges *"Carry On!"*

A heritage of fine manufacture and fair dealing has been handed down to the present members of the Myers organization — and with it a definite responsibility towards the countless thousands of farmers who have learned to look for efficient performance and the limit of wear from *all* products carrying the Myers Mark of Quality.



If you are using Myers Products of any kind you fully realize that the ideals of the founders of this business are still being maintained. We take just pride in the fact that today we are known as "World Headquarters for Pumps for Every Purpose, Hay Tools and Door Hangers" — and we are grateful indeed for the splendid opportunity handed down to us to serve the farm public through the national organization of Myers distributors and dealers.

"Take Off Your Hat to The Myers" is more than a well-known trade-mark. It is a *quality challenge* and an ever-present reminder to every member of the Myers organization of the vital necessity of "Keeping up the good work" so that the name of Myers may always be a guarantee of reliable service and fair dealing.

See your dealer or write us today for his name—the Myers Catalog—and complete information about the Myers Products that interest you.

THE F. E. MYERS & BRO. CO.

262 Orange Street ASHLAND, OHI(

Waukesha Co. Holstein Meeting

The Waukesha County Holstein Breeders' Association held its twentieth annual meeting at Waukesha, Wis., Jan. 27, with a very good crowd in attendance. The secretary's report, covering an eleven months' period, Feb. 1 to Dec. 31, 1926, showed a gratifying increase in the number of Holsteins sold for members at private sale by the association. In the eleven months which the report covered, $137,798.33 worth of Holsteins were sold privately, a 15% increase over the business done in the previous 12 months.

W. H. Swartz, J. W. Burbach, and D. J. Howell were re-elected as directors.

The afternoon program was largely on milk and milk marketing. Howard Greene, a large certified milk producer, E. M. Clark of the Holstein-Friesian Association of America, and E. R. McIntyre of the Wisconsin Farmer were the speakers.

The Corn Borer Situation

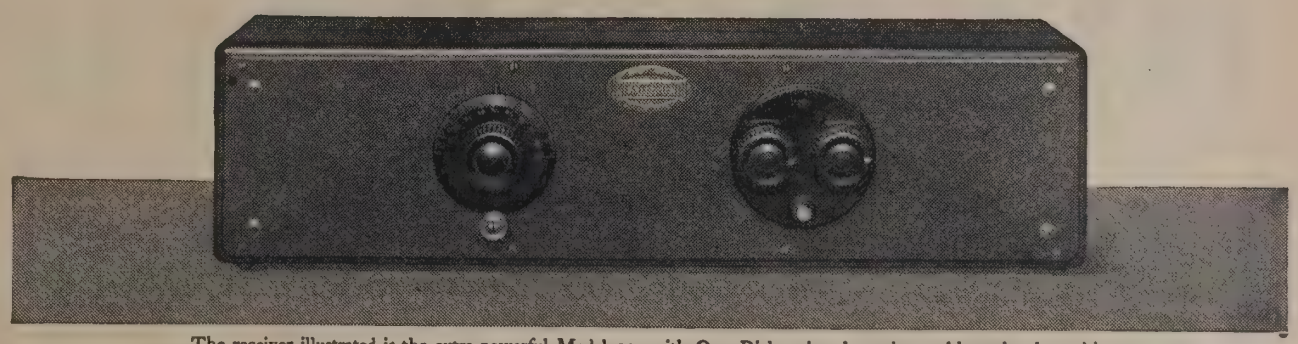
A conference of experiment station directors of the corn belt states, representatives of the U. S. Department of Agriculture, and others was held at Washington on January 6 to consider the corn borer situation. Professor F. B. Morrison of Wisconsin reports that details were presented concerning the research work carried on thus far by the United States Department of Agriculture and the Ohio Station. The European corn borer has just been found in Northeastern Illinois. It is also quite near the Michigan shore of Lake Michigan. This pest, the most serious that has ever threatened our corn crop, has spread steadily the past few years from Ontario across Lake Erie to Ohio and then to parts of Michigan and Indiana.

The plan under the federal appropriation of ten million dollars will be to wage this spring a drastic campaign against the borer in a strip 50 to 100 miles wide on the outskirts of the present infested territory. Farmers will be required to use proper control measures and they will be compensated for the extra expense they are forced to incur, in addition to the normal cost of the ordinary methods of growing the corn crop.

According to the reports at Washington, the best possibility of controlling the borer is through the plowing under very thoroughly of all cornstalks, corn stubble, and corn cobs, either in the fall or the spring. Some of the borers will be buried so deep they cannot emerge, but many will come to the surface. Here they will perish unless they find debris to take refuge in.

Except in very heavily infested areas, practically all the borers are found in corn, although they are capable of attacking 200 species of plants. Therefore, growing corn under control measures offers hope of checking the pest, though probably not of exterminating it.

The Ohio Station, in co-operation with farm machinery manufacturers, has devised an attachment for corn binders which makes possible the cutting of the corn within 2 to 3 inches of the ground. This leaves less borers in the field than otherwise. Also a "stubble beater" has been developed. When this is run over the field, it chops and tears into shreds the corn stubble and stalks, killing practically all the borers. As thus far developed, the machine works best on corn stubble, instead of standing cornstalks.



Damage from the pest will be the worst in sections where the practice is to leave the standing stalks in the field, as under typical corn belt conditions. Where the crop is ensiled, the pest will probably not cause so great damage.

The Ohio Station and the United States Department of Agriculture are likewise carrying on extensive cultural experiments. They find that late planted corn suffers less from the borer, though the late planting itself tends to reduce the yield.

Work is to be continued on the introduction from Europe of parasites of the corn borer in the hope that some parasite may be found which will aid materially in holding the pest in check under conditions in this country. Unless it is possible to check the borer, it will unquestionably reach Wisconsin in a few years. However, this state will probably suffer less than most others from the borer, since such a large part of our corn crop, including the stalks, is fed to stock.

Samantha says: As discretion is the better part of valor, so silence is the better part of neighborhood gossip.

ATWATER KENT RADIO

The receiver illustrated is the extra-powerful Model 32, with ONE Dial; price, less tubes and batteries, but with battery cable attached, $140. Other ONE Dial Models, $70 and $85. Radio Speakers, priced from $16 to $23.

It couldn't be better—*if built to your order*

WE KNOW exactly what you wanted because so many of you have told us.

You wanted *ease of operation.* You find it in the receiver which gets everything within range with the mere touch of the fingers of one hand on ONE Dial—the *true* ONE Dial with no secondary adjustments to confuse and delay.

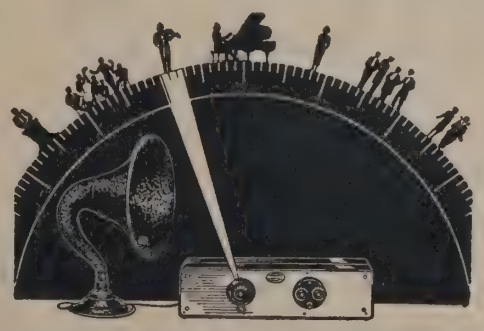
You wanted *extra power* in order to get daytime market and weather news as well as evening programs. You find that no receiver reaches farther than the Atwater Kent ONE Dial Model 32.

You wanted *clear tone.* You find Atwater Kent tone as clear as a church bell on a frosty morning.

You wanted *reliability.* You find Atwater Kent Radio, factory-tested 159 times, famous everywhere as the Radio that works and keeps on working.

You wanted *neat appearance.* You find Atwater Kent Radio blending with the appointments of any home—a joy to the eye as well as the ear.

You wanted a *sensible price.* You find that quantity production in the largest Radio factory results for you in many dollars saved.



In short, you wanted all-round Radio which you could buy with absolute certainty you were getting your money's worth. You find it in Atwater Kent Radio.

It's the all-round Radio.

The nearest Atwater Kent dealer is an experienced and friendly adviser. His interest in you does not stop when he makes a sale. Let him help you select the Atwater Kent Receiver and Radio Speaker that meets your demand.

EVERY SUNDAY EVENING:
The Atwater Kent Radio Hour brings you the stars of opera and concert, Radio's finest program. Hear it at 9:15 Eastern Time, 8:15 Central Time, through:

A Decade of Co-operative Dairy Endeavor

ORGANIZED to improve milk marketing conditions in the Philadelphia Milk Shed, the nter-state Milk Producers' Associaion, successors to the Philadelphia Milk Shippers' Union founded in 901, has now rounded out ten years f strong co-operative endeavor.

The growth of this organization is presented in a very graphical way in he illustrations on this page. In his nnual report, President H. D. Alleach reviews the progress of this organization. Mr. Allebach has been dentified with the organization from ts beginning and R. W. Balderton has been its secretary throughut. From Mr. Allebach's annual reort we glean the following story:

Wartime increases in milk producion costs had reached a serious sitution by 1916. Efforts to increase etail prices during the period 1901 o 1915 had been met with very trong resistance on the part of the ublic. The farmers realized that omething very constructive must be one if they were to stay in the dairy usiness.

In the summer of 1916 the Pomona Grange of Chester and Delaware Counties, Pennsylvania, appointed a pecial committee to help organize he farmers. Meetings were held at nany points. The by-laws adopted or the new organization provided for (1) local units; (2) county organization; and (3) a board of directors.

About the same time some farsighted civic leaders suggested a milk commission be appointed by the governors of the four states supplying Philadelphia; which should investigate the whole milk marketing situation and report back to farmers, dealers, and consumers alike. The immediate result of the hearings of this commission was to satisfy the consumers of Philadelphia for the first time that, in order to have an adequate supply of milk for themselves and their children, the price to producers would have to be sufficient to enable the farmers to continue in business. The need of an immediate advance in price was clearly shown.

At the annual meeting held December 11, 1916, F. P. Willits was elected president, F. K. Tyson vice-president, R. W. Balderston secretary, and Walter Kirby treasurer. On March 17, 1917, a charter was granted the association. Two days later the first board of directors' meeting was held at which Secretary Balderston reported an estimated membership at that time of 3,494.

At the first annual meeting President Willits' report stated, "The first test of our strength came July 1st when we assumed active charge of the sale of milk of our members. We demanded and secured a substantial advance over the previous price."

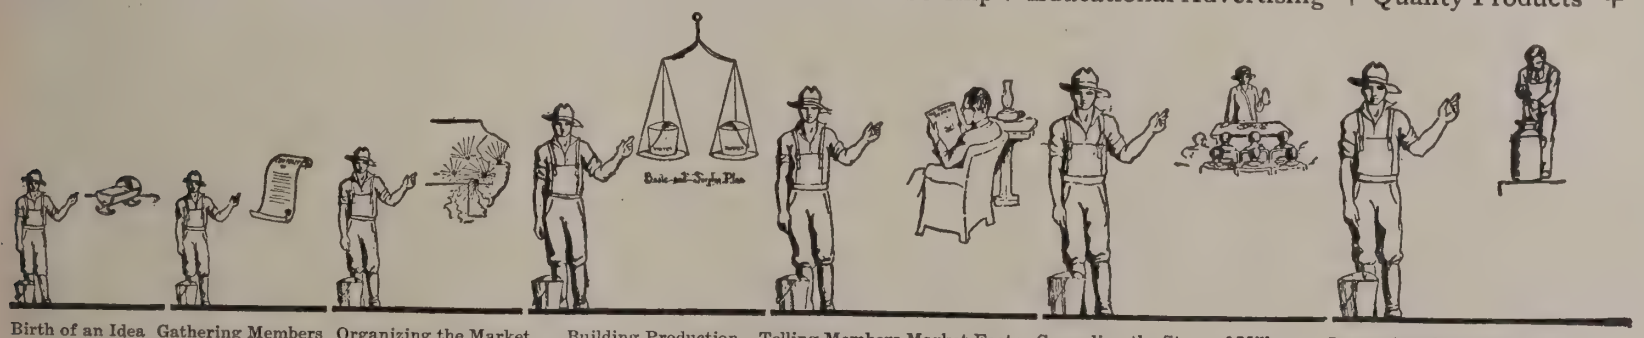
In 1918 the president reported, "The policy of carefully inspecting the dealers' books and eliminating unsound business practices has enabled the dealers to sell for 14c per quart as compared with 17c in New York and Baltimore. As an example of the improved conditions I might add that the Philadelphia dealers have voluntarily agreed to so concentrate their routes that one man and one horse serve as much milk as was commonly delivered by two men and two horses ten years ago in this city, or even now in many neighboring cities."

The "Philadelphia Selling Plan" was developed in the summer of 1919, was presented at the annual meeting held December 1st and 2d, and went into effect in January, 1920.

Early in 1920 the proposition was considered to issue a monthly paper. "The Milk Producers' Review" appeared first in May of that year. This publication is now in its seventh volume. It has proven its value in keeping the membership informed on the market situation.

Realizing that successful efforts to increase milk consumption would increase the demand for dairy products and that this might be partially obtained through advertising, the association in 1921 levied a tax of one cent on every hundred pounds of milk sold by its members.

In December, 1920, the Philadelphia Inter-state Dairy Council was organized. Its activities have been very closely allied with the Milk Producers' Association. This combined effort to spread the story of milk resulted in an increase of over twelve million quarts for the year 1921, according to President Willits' report.



The association set for its goal in 1922, Quality Production. The Quality Control Department was organized in July, 1921, and carried on a campaign to improve the quality of milk through the use of sediment tests and country meetings. Moving pictures were developed to put across the story. In 1923 a system of checking, testing, and weighing was inaugurated. General testing conditions throughout the territory were greatly improved through the work of this department.

Inspection on farms and at plants as a part of the Quality Control program began in March, 1924.

In 1925 the association's system of records was substantially enlarged. A history card for each member was started in January of that year. Great stress was given to the collec-

(Continued on page 223)

1916 Vision + 1917 Faith + 1918 Co-ordination + 1919 Stabilization + 1920 Informed Membership + 1921 Educational Advertising + 1922 Quality Products +

Birth of an Idea | Gathering Members | Organizing the Market | Building Production | Telling Members Market Facts | Spreading the Story of Milk | Improving the Quality

The above illustration shows accurately the growth and accomplishment of the ten years of progress of the Inter-State Milk Producers' Association. The comparative growth of the organization is pictured in the size of the farmers, drawn to scale. Each farmer points to an illustration of what has been carefully selected as the outstanding new work of that year. Above each picture is the marketing principle illustrated by that particular activity.

1923 Protective Supervision + 1924 Standardization + 1925 Knowledge of the Market + 1926 Balanced Supply and Demand = THE YEARS TO COME

1 Good Prices
2 Assured Markets
3 Fair Competition
4 Confidence in the Future

hecking the Testing and Weighing | Safeguarding the Quality | Developing Market Records | Developing the Selling Plan Further | Results

There are milestones in the life of every individual and every organization which denote definite periods of growth and development, of progress and accomplishment. This illustration records the healthy enlargement of membership, year by year, during the ten years of its existence. Parallel with this membership increase has been a steady improvement in service to members, serious problems solved, definite goals reached, and a continuous education in co-operative principles by working together for the common good.

THE FEEDING OF DAIRY COWS

No. 9—Summary

Good Dairy Cows Are Important but the Man Who Grows the Crops and Feeds Them to Cows Is More Important

A FEW days ago we were on a farm where cows were being fed moldy silage and marsh hay as roughage. The cows were thin, extremely lousy, and covered with more dirt than is conducive to good health and clean milk.

When we came away we thought of the opening statements in this series of articles. "The *good* dairy cow is a *good* market for crops grown and for feeds purchased. The value she returns for these depends very much on *how* she is fed. Her feeding depends on the *knowledge* and *skill* of her *owner*."

In concluding this series we are tempted to say something about the owners of cows instead of repeating briefly what has already been said. We promised the summary and will stick to it but we want to emphasize here that the man factor is by far the most important one in turning feeds into higher values through dairy cows. In making a summary it is necessary to be brief—to leave much between the lines. Detailed discussion has already been made.

The first article discussed five important points that have a very direct bearing on the profits made from cows. The first of these states that the owners of cows must first improve their knowledge and skill in feeding and managing cows before the cows themselves will be improved. It was emphasized that cows are nothing more or less than indirect markets for crops grown and purchased, and that in this respect owners have something to say about the final returns for their labor.

About 50 per cent of the nutrients of the feed fed to average cows is used for body maintenance. The better the cow and the better her ration, the greater the proportion of feed nutrients used for making milk.

It is poor business to underfeed good cows. It is worse to feed poor cows too much. Either increases the feed cost per hundred pounds of milk produced. It is likewise poor business to feed good cows poor rations. This is just as bad as to feed scrub cows good rations—it is worse. In either case the feed cost per hundred pounds of milk produced is too high to return good values for the feeds fed.

Dairy cows are well adapted to use large quantities of roughages. Usually feed nutrients may be supplied cheaper in roughage than in concentrates.

The backbone of a good ration is found in a succulent roughage and a legume hay. When the silo and hay mow are empty, the pocketbook likewise begins to lose its contents. Some succulent feed and legume hay may be grown almost anywhere that dairy cows are kept. The skillful dairyman finds out what succulent roughage and legume hay he can grow best and then arranges his crop producing program so that these feeds may be grown in adequate quantities to supply the needs of his herd. Plenty of good roughage reduces the cost of grain feeding, but with good cows it does not serve to eliminate the need for some grain.

Some concentrates are needed because good cows cannot get enough of the bulky roughage to satisfy their requirements for normal production. The concentrates mixture is to supply additional nutrients and to add nutrients in such proportion as will properly balance the ration. The basis for selecting the feeds to be used in a concentrates mixture depends much on the kind of roughage it is to be fed with.

The most common errors in feeding concentrates are: (1) underfeeding in quantity; (2) feeding a mixture not suitable for the roughage fed with it; (3) underfeeding of protein. The effect of these errors is to increase the feed cost per hundred pounds of milk produced.

A simple rule for feeding roughage is to feed all the cows will clean up. Where silage and hay are both fed this will be about 3 lbs. of silage and 1 lb. of hay daily for each 100 lbs. of live weight; where only hay is fed it will be about 2 lbs. daily for each 100 lbs. of live weight. The actual amount consumed will vary according to the individuality of cows and to the quality of the roughage.

After the concentrates mixture has been made right for the available roughage, it is fed according to the production and condition of individual cows. With breeds whose milk tests 4 per cent fat or less the c... centrates mixture is fed at a rate f... about 1 lb. for each 3½ to 4 lbs. f... milk produced; for the higher test g... breeds it is fed 1 lb. for each 2¾ o... 3¼ lbs. of milk produced. He... again the actual amount that sho... be fed will vary somewhat accord... to individuality of cows and qual... of roughage. With simple stand... feeds this rule is fairly reliable wh... compared with an acceptable feed... standard.

Definitions of terms used are ... repeated here. The reader is refer... to article 5 of the series.

A good ration is palatable; it ... bulk and succulence; it is well b... anced, meaning that it supplies nu... ents in the right proportion for ... cow's needs; it supplies an adequ... quantity of nutrients; it does not c... tain any feeds that, when prope... fed, will injure the cow or impart ... desirable flavor or odor to the m...

In article 5 you were told how ... calculate the maintenance and p... duction requirements of cows. ... this article we present a table sh... ing these calculations already m... for cows of different weights, prod... tion, and fat percentage in their m... The legend beneath the table t... how it may be used to find the nu... ent requirements of cows ranging ... weight from 800 lbs. to 1,400 lbs., ... production from 15 lbs. to 60 lbs. f... milk, and in fat percentage from 3 ... to 6 per cent. Save this table ... future use—it will save time in che... ing up the requirements of your co...

The above table gives the nutrient requirements for cows calculated according to the Haecker feeding standard. To use the table first find the weight of a cow whose requirements ... desired to be known in the first column at the left; in the next column find the figure representing the percentage of fat in the cow's milk; next follow this line to the right until reaching t... double column of figures under the heading representing the amount of milk the cow produces. The figures in this line at this point give the amount of digestible protein and total digesti... nutrients required for maintenance and production. Article 6 of this series tells how to put feeds together to meet given requirements. Save this table for future reference.

GUERNSEY CATTLE IN THE UNITED STATES

THE Guernsey breed originated on the Channel Islands which belong to England but are located somewhat nearer the north coast of France. The original foundation cattle doubtless came to the islands from the mainland of Europe and most of them were probably the large red and brindle cattle from Normandy and the small red cattle from Brittany.

All of the Island cattle were at one time known as Alderneys, the name coming from the island of Alderney, but later laws had been enacted forbidding the importation of cattle from the continent or between the islands of Guernsey and Jersey, two distinct breeds were developed. That one on the islands of Alderney, Sark, and Guernsey became known as the Guernsey breed, and the cattle on Jersey Island as Jerseys.

GOVERNOR OF THE CHENE, LEADING GUERNSEY ADVANCED REGISTRY SIRE, WITH 114 A. R. DAUGHTERS AND 48 A. R. SONS

Importation and Distribution

The first known importation of Guernseys into the United States was made in 1818 by Reuben Hains of Germantown, Pa., but no authentic records of these animals or their descendants were kept. Another importation of a bull and two heifers was made in 1833 by a sailing captain who sent them to his brother in New Hampshire. Thirteen head were imported between 1840 and 1868 and from 1874 to 1905 there were some cattle imported each year. The total number of Guernseys imported up to January 1, 1905, was 1,645 head, and from 1905 to 1926, 10,346 were brought over.

The American Guernsey Cattle Club was organized in February, 1877, and at the time of their first meeting in December of the same year there were 193 Guernseys registered by 40 breeders. On April 1, 1926, there had been registered a total of 119,049 bulls and 201,159 cows.

According to the U. S. Department of Agriculture, there were, in 1920, 8,000 registered Guernseys and about 1,900,000 grades in the country. The breed is to be found in every state, but by far the largest number are in the North Atlantic and North Central States.

General Characteristics

In size the Guernseys are about equal to the Ayrshires and slightly smaller than the Brown Swiss. The calves weigh from 55 to 85 lbs. at birth and reach maturity early. When mature the cows weigh from 850 to 1,300 lbs. averaging about 1,100 lbs.; and the bulls from 1,400 to 2,000 lbs., averaging about 1,600 lbs.

The color of the Guernseys is fawn and white, with fawn predominating. A light cherry red with white is also found. Sometimes white may be entirely lacking except on the legs. The switch is usually white and the tongue light in color. The horns are of moderate size and amber in color. The skin is yellow.

Production

Guernsey milk has a high per cent of butterfat and a yellow color. The 22,165 cows and heifers that have completed records up to August 1, 1926, produced an average per cow of 9,664.5 lbs. milk and 482.3 lbs. fat, the average fat test being 4.99 per cent; 42 per cent of these records were made on twice a day milking, 55 per cent were milked three times daily, while only 3 per cent of the records were made on 4 milkings a day.

Five hundred fifty-one Guernsey breeders had 2,384 cows on official test August 1, 1926, and of these 433 cows owned by 155 breeders were in the Farmers' Division or 305-day class.

The present world's record holder for the breed is Anesthesia Faith of Hill Stead whose record made as a four-year-old is 1,112.5 lbs. butterfat, 19,741.9 lbs. of milk.

In the Advanced Register are three classes. The single letter class fixes a minimum of 400 lbs. fat in 365 days for a mature cow. The double letter class requires in addition that the cow carry a calf for 265 days of her record. The triple letter class fixes a minimum for a mature cow of 360 lbs. fat in 305 days on twice-a-day milking, cow to carry a calf 205 days.

The ten highest fat producers and milk producers for the breed are listed below:

Leading Guernsey Producers in Each of the Several Advanced Register Classes

Class*	Age years	Name	Milk lbs.	Fat lbs.
A	Mature	Countess Prue	18,626 9	1103.3
B	4½—5	Anesthesia Faith of Hill Stead	19,741.9	1112.5
C	4 —4½	Norman's Missaukee Red Rose	17,527.2	900.7

What I Am Trying To Do On My Farm

To Solve The Labor Problem

W. J. DOUGAN, WISCONSIN

THE present condition in hired help for the farm is uncertainty. If other industries can use the men, the farm must wait. If other industries shut down, men flock to the farms. In reality, with large classes of laborers the farm is the last resort for a job. The farm-raised boys have become enticed by apparent high wages and short hours in other industries. Therefore, the farmer has no certain sources of labor to rely upon. He usually finds himself short of help when it is most needed.

In my line of dairying, where I produce and distribute my own milk, a constant supply of reliable help is all important. Therefore I have given this end of my business close attention.

I require men of high quality. They must be intelligent, of clean morals, loyal to their employer, and efficient. The farm requires men of intelligence because they have to be independent workers. They must take a job and carry it through to completion. They must be clean in morals and in person because they handle the most delicate and most easily contaminated of food. They must be efficient because there is no place on a farm for a droon or a shirk. I am able to keep men of this high standard. Many of my men are college graduates; all are men of alert intelligence. Even during the war I held to my ideals, and had enough men to carry on.

I realize that to hold men of these qualities one must offer something in return. We cannot drive such men like beasts, house them in shacks, and feed them at the trough, even though we may pay high wages. Such men must have desirable working and living conditions.

To give suitable working conditions, I first try to keep enough help to do the work in the right way at the right time. Nothing will take the heart out of an ambitious man like always being behind with the work; sowing small grain when he should be planting corn, and planting when he should be haying. Nothing has a worse effect on the man than this, unless it be the companion evil of always slighting, half doing the job, so as to get through in time to start the next. A good motto, then, for any farmer, is: Enough help to do the work in the right way at the right time.

Self respecting men must have suitable tools; not necessarily expensive, fancy tools, but tools intended for the job and kept in repair. Good stock and a fertile soil are the necessary accompaniments of good men. You cannot expect an ambitious, high-spirited man to stick by the farm with scrub cows and a barren soil.

Men must have a chance to live as well as to work. I am solving this problem by working toward a shorter farm day. The farmer can stand a longer day than the mechanic, because his work is more diversified; but a fourteen-hour day, as is practiced on many farms, would kill any industry. I find we can shorten the day even on the dairy farm, and yet tend to more efficient work.

When I started dairy farming, I found it necessary to do continuous work 365½ days in the year. The dairy cow knows no Sundays or holidays. When God gave the command to the children of Israel to rest on the Sabbath, He gave a double portion of manna on the day preceding, and none on the Sabbath. He did not make the dairy cow that way. By no hook or crook can we get the cow to give a double portion of milk on Saturday and none on Sunday. Therefore she must be milked and the milk cared for each day of the wee How, then, can we get a regular d of rest? If the slow, plodding Isra ites in their pastoral life needed t regular relaxation, how much mo do we dairy farmers need it in t rapid age?

I tried various plans to get t Sabbath rest for myself and fami and all those connected with t farm. For many years we have f lowed this plan. On Sunday, t field work, of course, stops. The fie men help with the dairy chores Su day morning. This lightens the wo for all. After the morning chor are done, only enough men are tained the rest of the day to do t necessary dairy wor The balance of the m have the day to the selves. All can get church if they so d sire. Then to even the time, each man h one-half day to hims during the week.

This plan has work to advantage of the m and to efficiency in g ting the work done. could not possibly back to the old plan everybody working of the time. We try keep the fourth co mandment, and it pa

The farm help shou have a fair share of t farm's prosperity. help gets from 25 cent to 35 per cent the gross income of t place. I do not pay wages but I try to me ure up in the fact that will get good m and keep them int ested.

The best class of m are those young men ability and ambition, either farm city bred, who want to work for period of years to get knowledge a experience, and save a little mon with which to start farming for the selves. If we can only encoura this class, the farm labor probl will take care of itself and t future of agriculture will be sured.

VIEW OF THE LIVING ROOM TO WHICH THE HIRED MEN ON THE DOUGAN FARM HAVE FREE ACCESS

Experience With Rock Phosphate

CHAS. D. KIRKPATRICK, IOWA

IN the last three years, twenty car loads of Tennessee rock phosphate have been used by farmers in this community. From this fact alone it might be inferred that our soil is unusually poor, but we resent that interpretation. The farms where the phosphate is being used are level prairie Grundy silt loam, and during boom times would have been priced at $400 to $500 per acre. However, men who are interested in soil problems are not the kind to trade around; at any rate those who have been buying rock phosphate here look upon their land as a source of permanent profit.

Though County Agent Sloss has made soil improvement a special project in Keokuk County and has reports from several dozen trials, I can best give my own experience which dates back to some small purchases of acid phosphate ten years ago. I was fully convinced that this soil is low in phosphorus and that an abundance is highly important for profitable crop production but I was not satisfied with acid phosphate. As compared with powdered raw rock phosphate, it costs three times as much per pound of the element phosphorus. After half a dozen trials I realized that the acidulated fertilizer must be used year after year and I was afraid to use a fertilizer in which 50% of the raw materials are sulphuric acid.

The Tennessee raw rock I found could be had in paper bags for $15.50 per ton f. o. b. my station. It is a red powder and handles like so much cement. Spreading must be done on a quiet day to avoid wind loss and it is advisable to harrow it into cultivated ground. Since the raw rock phosphate will not dissolve in water, there is no waste in drainage water but it must be thoroughly mixed through the soil by cultivation so the plant roots will come in direct contact with it. In order to get the largest possible area of surface exposure, it is important to get a finely ground material. I have had several tests for fineness made by commercial engineers whose reports on my purchases range from 94.8% to 97.5% through a dry screen with 10,000 opening to the square inch. At some of the experiment stations where coarsely ground material has been used, rock phosphate has been relatively slow acting and unprofitable. This was especially true at the Ohio Station where only 67% would pass a standard screen.

When rock phosphate was first put on the market, the custom was to plow it under with green manure. I heartily approve of green manure if the soil is in poor physical condition and needs the organic matter to promote favorable bacterial reaction, but I have not found any need for green manure to plow under directly in contact with the rock phosphate. It is just as quickly active if spread on cultivated ground, alike on cornstalks ahead of the small grain seeder, or on the seed bed prepared for corn. In several fields I have seen half a ton application in the spring add ten bushels to the oats crop and follow up with as much as double t tonnage of clover the next se son. The benefits to corn yiel have been in two ways: t yield has been directly advanc several check strips sho ing more than ten bushels differe the first year, and in quality the i provement is noticeable in earlier n turity and stiffer stalks.

In one thirty-acre field, I had ne been able to get a yield of m than sixty-five bushels per acre til gave it an application of rock ph phate a ton per acre. The first cr after that weighed in to the crib o eighty bushels per acre. That I h not been mistaken in crediting t increased yield to the rock phosph is proven by the results my neighb had on the adjoining field. He spr a thousand pounds of rock phosph per acre on half his field and as a sult got a ton per acre more hay first cutting and proportionally m second growth which was pastur The line between the phosphated a unphosphated halves of the field w sharply distinguished by sever inches difference in height of grass, the number of stems per pla

TRAILING HOLSTEINS TO SOUTH AMERICA

The Log of Their Keeper

JAMES G. BEATTIE, WISCONSIN

DECEMBER 31. This is New Year's Eve, and 105° in the shade. We left Buenaventura at 6 p. m. Someone has a propensity for water barrels. Last night one of the cattle's disappeared; it was emptied, flung over the side, and towed ashore. Learned today, on inquiring around a little, that barrels are very much in demand with the people here, as they use them to catch the rain. Rain is what they drink; so no catchy, no drinky.

January 1. New Year but, as Tony —sailor—says, "No new revolutions." Steamed due south all day. A light sea was running this a. m., but a squall knocked it down, soaking the cattle at same time. Another squall soaked them tonight, and still another one an hour later, so that they get plenty of soaks. We crossed the equator at 4 p. m. but you never would have known it. There were no gates to open and close, no tolls to pay, no red or green lights to heed, and no signs to read. Everything so far as the eye could reach was just plain sea—water, and plenty of it.

January 2. A lovely day at sea, passing the mountainous coastline of Ecuador and Northern Peru. Last night some thoughtless fellow hung his shirt up in the engine room to dry and, in some mysterious manner, it fell down and lodged in the meshes of the steering gear, making it possible for the sailor to turn the wheel in only one direction. When the Humming Bird began steaming round in a

BULL FIGHT AT LIMA

Matador trying to incite the bull so he will charge and give the hero a chance of stabbing him between the shoulder blades.

circle, an investigation soon led to the discovery of the garment. The old man was irate over the incident; no one claimed the shirt.

January 3. We dropped anchor in front of Talarra, Peru, at 2 p. m. instead of 2 a. m., which was the rumor on deck yesterday. This port is built around a little peninsula of water that backs up into a mammoth coulee for perhaps a mile or more. The shoreline is dismal and rugged, the only excuse for the town's existence is as a loading and discharging port for the oil fields near here.

They had a rain last year, the first since 1884. Or was it 1874? But regardless of the correct date, it is clear to be seen that they do not have rains in Talarra. In the first, there is not a vestige of vegetation, and second, their roofs are not built to shed water. In another direction from the harbor, which has berths for two ships only, a cemetery flourishes. Tonight, after darkness fell, a queer procession of lights wound its way, very slowly, toward it. Some say it is an Indian funeral, that the night time is when they occur, while others contend that it is food being taken to the graves for those in repose; and that the gulls get it at daybreak and the Indians are no wiser. Some goats —red and bearded—and donkeys hang around the shacks, but what they live on is hard to say. In the bay, porpoise jump, cormorants dive, buzzards hang overhead, and great spectacled gular pelicans roost on the buoys, together with thousands of gulls.

January 4. These natives are descendants of the Incas, the historic Incas of Peru, the people Pizarro stole the gold from. They are dark skinned, not big of stature—resembling the North American Shoshones—Argus-eyed, and hair black, straight, and wiry. They have more pep than the stevies in Buenaventura; they hustle the cargo out faster, which is what we like to see, and they are more indulgent with wearing apparel, as some have shoes and an occasional one a shirt with which to shield his muscular, bronze-tinted loins and back.

STREET SCENE IN CALLAO, PERU, —THE CHARACTERISTIC BALCONY AND DONKEY

Once more, tonight, the procession went to the graveyard. They move slowly in a row and each carries his own lantern. We learned from a source today, which I would consider reliable, that these people march up there regularly with food for the dead.

The Southern Cross came to view in the West Indies, but here it is a pretty constellation. The North Star is receding down the horizon.

January 5. I tried to make a deal this morning with one of these sepia-skinned fellows on a jackknife, but we couldn't quite get together on the price, the thing that has prevented more than one deal from going through. A pretty smart *hombre* this fellow was. He couldn't speak Chillyvillian and I couldn't speak *Espanol*, so really we were at a disadvantage with our trading. He asked me what I would take for a cow, and I told him an oil field—*un grande oily hacienda.* "Ah!" said he, in awe. Either awe or indignation, I don't know which. Then he says: *"Compro cigaretty!"* And I says: "Me no selly cigaretteo, me have plenty jacknifeo to selleo." At which he became disgusted and walked away. And you couldn't blame him. I'm going to get a Spanish dictionary as soon as possible.

We had beautiful brown hash for dinner and my bananas are ripening. What combination could be better than that? At 3 p. m. anchor was lifted, two tugs gave the Humming Bird a hand to get herself squared away and two hours later the bleak, sandy shore line of Talarra is but a memory. Also, what could be better than that?

January 6. We have steamed from dawn till dark under a sun shining full time and strenuously and without once seeing a single object, except waves, waves, waves,—the waves, the rolling, restless wanderers of the sea. The heavens are adrift with stars, but none appear so brilliant nor half so close at hand as does Venus which gleams through the portholes at midnight with a sentry's eye.

January 7. We've been steaming down the coast of Peru today, occasionally heaving in sight of guano islands and promontories that are tenanted by birds that are protected by law. They are distant, very distant, on the horizon, and through a haze one barely recognizes them. The Humming Bird is doing her best against the contentious Humboldt current, a fresh breeze, and a heavy swell. Aboard is the monotonous regularity of sea routine. It is just a day at sea, a plain, ordinary, uneventful diurnal stretch that must be lived if one desires to reach others ahead of it.

This forenoon the petty officer's messman sprayed my cabin with tear gas. Other cabins got it, too, otherwise I would have considered myself under observation. Tonight the cockroaches are scurrying hither and yon, as if a deadly foe were on their heels. Also the ranks of ant regiments have been broken for the time being.

January 8. Well, this day was about as eventful as yesterday was uneventful; in other words, the term, "inverse proportion" could be used. We arrived before Callao, Peru, at daybreak (pronounced as you please in Chillyvillian, but in *Espanol* it begins like a crow and ends like a cat—caw-yow), ran up the required flags, got a pilot to assign us to our berth, and soon the medical authorities were out in full regalia to inspect us. There was a short session with them in the skipper's quarters after which we were all mustered on deck for a roll call, which is distinctly Peruvian in custom. Anyone making these South American countries often should be well posted on customs, as each country has a set entirely its own.

While we were eating dinner, these adamantine tickets, called stevedores, came aboard, discovered that the lock on the poop deck would yield to a little persuasion, entered, knocked the lock off a trunk containing hospital supplies for the cattle, and ransacked it plenty. Since, I've wondered why they left the trunk. With one of these local cops we "frisked" a few of the barges but with no success. I imagine the hipboots, hospital blankets, clinic thermometers, sponges, bandages, surgeon's scissors, scalpel, etc., have parted with each other's company forever. The scalpel could be used to trim cabbages in a pinch.

Tonight everybody but the watch went ashore for a cool glass of beer. And here is mutual misunderstanding. There are many things about the customs of the Peruvians that we do not understand, and there are instances in our case when the Peruvians don't understand. One of them is coming from the land of prohibition and spending our money for their

THE CHIEF MATE OF THE HUMMING BIRD

scotches, extra drys, and lagers. They simply can't figure us.

January 9. Nothing has been done about unloading cargo today. The stevies came on board at 8 a. m. and struck 15 minutes later on the grounds that they would not open hatches, claiming that it was dangerous and that (for that reason) they must have more pay. The ship's agent was obdurate, so ashore they went and with them went one of my water pails. When they will work again nobody knows. Someone risked, "When they get hungry."

I went ashore this afternoon, the first in 25 days, and the stability of the ground felt strange. Bought a straw hat and two tickets to the bull fight in Lima, tomorrow—*manana.* The narrow calles and avenidas and the odd methods the people have to do things with impress one. They have little donkeys for transportation purposes and stout little fellows they are. It is regretful that they do not have a humane society here. Going through the Plaza one sees nasturtiums, geraniums, and verbenas—all well known flowers in Chillyville, Wis.

January 10. One of the mates and I went to the Plaza de Torros (place of bulls) at Lima, which is a 25-minute ride from Callao by street car. We enjoyed the ride and seeing the growing fields of cotton, corn, and alfalfa; and the orchards of apple, peach, and fig. Of course, all crops

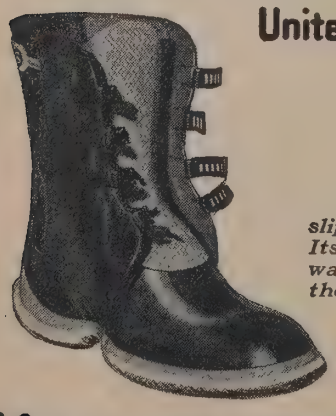
UNLOADING AN ENGINE AT CALLAO, PERU

"U.S." Blue Ribbon Boots have sturdy gray soles, uppers red or black—in knee to hip lengths



Only the best rubber can stand this test

BEND a "U.S." Blue Ribbon upper, wrinkle it as you will. The high grade rubber in it keeps you dry and comfortable when inferior boots have been thrown away.

And it's reinforced for the hardest job. At every point where strains are hardest from 4 to 11 separate layers of tough rubber and fabric are anchored in—to give *extra* strength. And the sole is built for farmers—it's oversize, as tough as a tire tread. It wears!

Seventy-five years of experience in making waterproof footwear is back of "U.S." Blue Ribbon boots and overshoes. They fit better, they look better, they wear better. Get a pair — and notice the difference.

United States Rubber Company

The "U.S." Blue Ribbon Walrus slips on right over your shoes. Its smooth rubber surface washes clean like a boot. Either red or black, 4 or 5 buckles

"U.S." BLUE RIBBON *Boots Walrus Arctics Rubbers*

Wayside Musings The Abundant Life

JOSEPH S. MORRIS, WISCONSIN

GRANTED that everything in life is not just as we would have it —in all probability it will always be that way—would you judge your life today to be a poor one or a rich one? What would be your standard of values? Would you judge yourself rich by the things you have or poor by the lack of things? Knowing how to make correct judgments as to real values is of the utmost importance to an abundant life.

Jesus, the great Teacher, was very poor and yet He was the earth's richest man. He was rich because He was in possession of abundant life. He spent not one moment in envying any man the things he had. His own life was crowded so full of truth, love, beauty, understanding, poise, power, knowledge of God and man that, seemingly, he lacked nothing. Yet, judged by ordinary human standards he would have been called a poor man.

The teaching of Jesus was teaching that welled up directly from life. He spoke the language that people knew. He took their common world and made it teach the highest lessons. His words, flung upon the air like scattered seed, have lived on in the hearts of men; molded the life of nations; have brought comfort, guidance, uplift, courage; have transformed life for millions.

The thought of the seed leads us to one of the rich days in the life of the great Teacher. A great crowd has gathered by the seaside. The Teacher gets into a boat, pushes away from the shore, and there under the blue canopy of the sky, with the bright sun streaming down upon the people, He tells them the beautiful parable of the Sower.

He Himself was an example of the Sower. He had the good seed of Truth. He scattered it wherever he went, scattered it in the sure faith that some of it would find prepared soil, take root, grow, bring forth its fruitage.

The people who listened to the parable could understand it. They knew all about weeds, and rocks, and hard-baked earth, and the fortune of seed that fell into those places. They knew, too, about the "Good Soil," knew that they, too, had cast in the seed in the sure faith that there would be harvests. They could readily understand that God, the Sower, had scattered the seed of truth, of good, of love, with prodigal hand, and that some had fallen on "rocks," some among "weeds," some on "hardened lives," and, happily, some always fell into good lives, prepared lives, lives that had been made ready, and that there had been harvests, some thirty, some sixty, some a hundredfold.

Abundant, rich, spiritually-significant lives come from innumerable seedtimes, cultivation, harvests. Men and women who have lived much, thought much, whose souls have been mellowed of life; men and women who can look with patient, kindly, tolerant eyes upon their neighbors; men and women who bear comfort, healing, uplift, and transformation in their hearts—these shall capture the heart of humanity.

Stinging criticism, relentless fault-finding, suspicion, failure to take into consideration all the facts in making judgments, these result in hard, stony, weed-grown, poverty stricken lives.

The Great Teacher walked among the men and women of His day and brought helpful, encouraging truth to them. He was not a lecturer spouting doctrines. He was anxious of life. He saw people anxious and troubled and showed them the birds, the flowers, the grass for which God was caring. He was intensely interested in life. Look through the gospels and see how Jesus touched life on every side. All things were used to minister to a life of loving confidence and

Crops exceed expectations

SUTTON'S. Pedigree Mangels are the heaviest cropping mangels known and also possess the highest percentage of dry matter. They have been bred for over 70 years for heavy production and practically every seed germinates. Hundreds of farmers and cattle breeders feed Sutton's Pedigree Mangels daily and are getting amazing results as well as saving money.

A dairy farmer of Johnstown, Pa., writes: "We planted the Long Reds and got an outstanding crop of 15 tons to a half acre. The crop so exceeded our expectations that we carefully weighed the product and measured the ground."

You can do as well. Write for illustrated catalog containing full cultural directions and valuable data on cattle feeding. Address

CONDON'S SILO KING **SEED CORN**

Fills the Silo Quickest With The Very Best of Silage

Finest strain of Ensilage Corn ever grown—so say all farmers in describing Condon's Silo King. *A true statement.* Grows 16 to 20 feet high; very prolific—two to three ears to the stalk; makes heavy, thick growth of fodder; big, broad leaves from ground to tassel. Yields

40 to 70 Tons Per Acre!

One acre Condon's Silo King will produce more and better tonnage than 2 acres ordinary corn. Mr. Carpenter, one of Winnebago's progressive farmers, while on a visit to our Seed House, said: *"Would not have any other corn as a gift when I can get your SILO KING."*

aith, to a life of contentment, to an bundant life.

There is a plan of continuous, abid- ng life in our world. Too often fear nd uncertainty get hold of us and estroy our peace of mind. Too often re we tempted to lose peace of soul n the quest for possessions and ever ore possessions. We forget that that ower that gives color to the plum- ge of a bird, beauty and fragrance a flower, exquisite shading to the loring of fruits, variety in shape nd form to foliage, loveliness to ke, and sea, and river, and desert, nd hill, and mountain is vitally con- rned with the crown of all life— AN. We forget, and this is written, at many may be caused to remem- r that this is so. Man can and must much for himself but when he has ne his all there is still necessary e eternal power of God.

St. Francis of Assizi so sensed the wer of God everywhere that he felt must be kind and tender to every ing thing lest he hurt God. Was not right?

The great Teacher's purpose was t to cram life into the grooves of ws. His purpose was to point out e highways of life and to thrill the ul with the desire to travel those ghways in confidence. He awak- ed a noble discontent in the poor ubles of possessions without char- ter and sent the soul after the real, fe Eternal, after God.

Some seeds fell by the wayside, up- the beaten paths, upon lives over nich all the cares of life were per- tted to tramp and harden it. The ed fell there but it could not take ot and so the birds carried it away. Some fell upon rocky, shallow ound; grew up in a hurry and then ed under the withering heat of the dy. Some fell into weedy soil and the eds grew up and choked it out. me fell into good ground and grew and brought forth harvests

Rich and fruitful character does t grow in us whether we will or rt. It comes from a set purpose to ve the abundant life. It comes from ading, and thought, and reverence, d good companionships, and love, d taking careful thought. The undant life is a beautiful thing ether you find it on the farm, in factory, in the office, on the rail- ads, or in schools and colleges. It is find everywhere and it is found al- ys when men have deliberately pre- red for it. It is a law of good re- ion and good science that the rich- results come only through pains- ing effort. They are deceivers who us that through the application some panacea we shall come all a moment of time into a rich and ndant life. They are deceivers be- se the experience of the race oves them to be deceivers.

There is enough truth in the world build the noblest race the world s ever seen but it can only come in natural way of every man trying better himself, trying to make his n soul richer and fuller.

Death and Taxes

Some one has said that death and es are two things from which man not escape. From the recent dies made by Bushrod Allin and B. Hibbard of the Wisconsin College Agriculture, it seems fairly obvi- that the farmer is hit harder by es since the war than ever before. During 1924 Dane County farmers d nearly three times as large a per t of their net incomes as did city village people. When taxes take rly one-fifth of a man's income, it beginning to look like conditions ch obtained in England right af- the war. From 1918 to 1924 the ne County farmers' taxes rose from 5.3% to 20.5% of their net income, while the tax on city people went up from 5.3% to 7.7%.

The main reason for this unwonted discrepancy between city and country tax rate is found in the failure of farm incomes to increase in proportion to urban incomes. The general property tax is relatively inelastic. It does not rise and fall with a variation in income as does the income tax. It is to be hoped that this initial study may be supplemented with additional data from other representative agricultural counties of the state. The accumulation of such facts is of utmost importance in laying a proper foundation for constructive consideration.—Wisconsin College of Agriculture.

"You bad boy. I wish I was your mother for about twenty-four hours."

"Well, teacher, I'll speak to Dad and maybe I can fix it up."

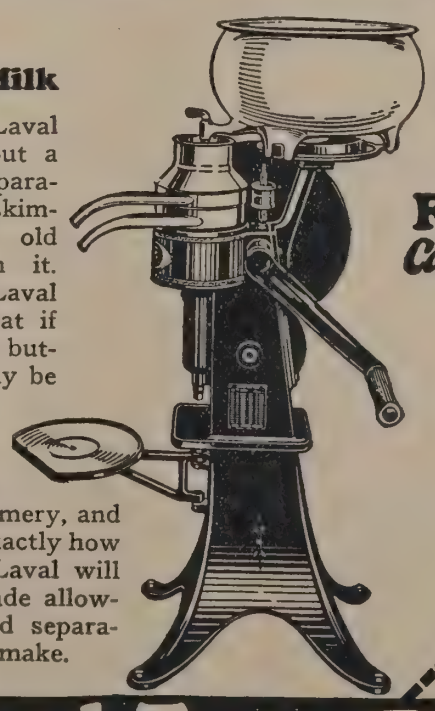
3 to 4 CROPS YEARLY

Mention Hoard's Dairyman to your dealers.



The butter-fat you *leave* in the skim-milk *won't* buy the baby any shoes

The loss of only 25 cents' worth of butter-fat a day costs you $91.25 a year—enough to keep the whole family well shod, and then some. Thousands of farmers have stopped the waste of much more butter-fat than that by replacing their cream-wasting separators with new, clean-skimming De Lavals.

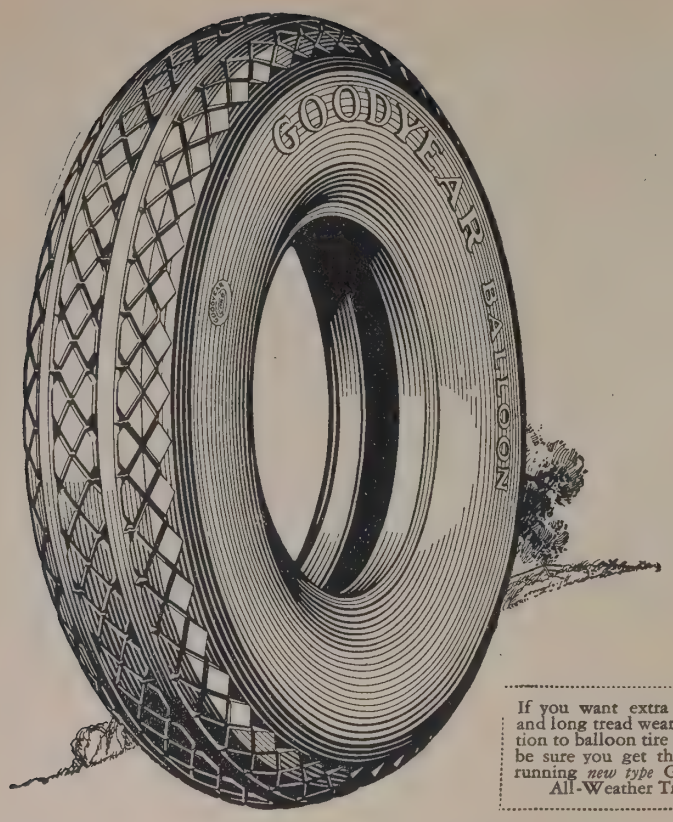
Never in the history of centrifugal cream separators has there been a machine to equal the new De Laval—for clean skimming, easy turning or durability. It has the wonderful new self-centering bowl which runs smoother and easier, and eliminates vibration. It will give you more and a richer cream than you have ever gotten before.

Skim Your Skim-Milk

Ask your De Laval Agent to bring out a new De Laval Separator and run the skim-milk from your old separator through it. The new De Laval skims so clean that if you are losing any butter-fat it will surely be recovered. Have any cream recovered in this manner weighed and tested at your creamery, and then you can tell exactly how much a new De Laval will save for you. Trade allowances made on old separators of any age or make.

New De Lavals sold on easy terms ranging from

$6.60 to $14.30 Down



the balance in 15 easy monthly payments

See and Try an Improved DeLaval

If you want extra traction and long tread wear in addition to balloon tire comfort, be sure you get this quiet-running *new type* Goodyear All-Weather Tread

Are you overlooking *something?*

Maybe you're missing one of the biggest factors in tire economy without knowing it.

You are if you're denying yourself the benefits of the service performed by your local Goodyear dealer.

He sells the world's greatest tires. His prices are low. He knows the right size and type of tire for you.

He will mount your new tire on the rim for you, fill it with air, and afterward help you care for it so it will deliver you its maximum performance.

If you've been sending away for tires you've been overlooking something worth having.

Prove it, next time, by giving your home town tire merchant a chance.

See how much it means to you in dollars and trouble saved to enjoy the quality and service advantages of the Goodyear policy.

This policy is: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that users can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced Goodyear standard quality Pathfinder

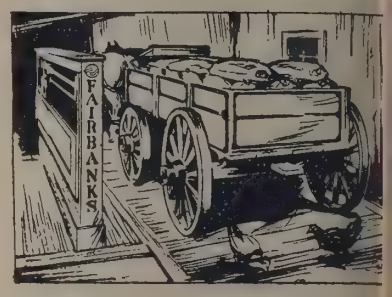
Opinions, Brickbats, and Bouquet

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative. destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.



Who Is Knocking Jerseys?

HOARD'S DAIRYMAN:—In your issue of January 10, W. E. Main of Michigan comes back at me for taking "Butterfat" to task for his slam at the Guernsey. Mr. Main seems to think my sarcastic letter was aimed at the Jersey and proceeds to compare the two breeds. He makes out a very good case for the Jersey which ought to be easy enough for such a fine breed. I never knock pure-breds and don't think comparisons amount to anything because, as a rule, they are meaningless figures; and although they say figures won't lie it is possible to do almost anything with them. I could go on comparing Guernsey and Jersey records till doomsday but would not be getting anywhere because the comparative records were not made under the same conditions or checked up by the same men.

Consider his tuberculin test statistics. They are of no value in comparing the relative healthfulness of the various breeds. Our herd has been subjected to the test fourteen times without a reactor, simply because we take pains to keep them from contamination when exposed on the show circuit and have no dairy herds nearby to spread tuberculosis in our neighborhood. I don't think Mr. Main's figures are correct or they would mean a very poor showing for the Jersey. To quote: "Guernseys tested, 82,824, reactors 3,444, per cent 4.16. Jerseys tested, 33,889; reactors, 7,438; per cent 2.37." The Jersey percentage looks like close to 20% to me. The last census showed 231,834 Jerseys in the United States and 79,446 Guernseys. If Mr. Main's figures are correct, nearly all the Guernseys have been tested and only about one-sixth of the Jerseys have been tried out. Please enlighten us or I am apt to let loose some more sarcasm.

I still contend that the reason Jerseys are not selling any better is because they are not being advertised properly. This issue of Hoard's Dairyman shows 54 Holstein ads, 48 Guernsey ads, and only 17 Jersey ads. Mr. Main contends that the Jersey people do their advertising in the Jersey Bulletin. The last two issues of the Bulletin show a total of 143 Jersey advertisements, or an average of less than 75 to the issue! There are over 20,000 Jersey breeders in the United States and the Jersey Bulletin reaches a good majority of them; it stimulates business among Jersey breeders and doubtless its few hundred advertisers are not complaining about the prices they get or the demand they have for their cattle. How about the 19,000 odd breeders who do no advertising in the Bulletin? Can they expect to get results? It is just plain foolishness to sit back like a lot of them do and comfort themselves with the thought that the Jersey is the best breed anyway and that when the Guernsey boom is over the good old Jersey will come back into her own safe and sound. Quit poring over statistics showing which cow did the best at such and such a contest and why such and such a breed is going to the wall. It is a lot of tommyrot.

Real dairy cows are all right, all good progressive dairy sections have strong representations of all breeds. As the Jew said, "Wherever you find a prosperous town you find Jews. Not that the Jew makes the town prosperous, but because he does not stay the town is not prosperous." Po dairy sections have mostly scrul and if one breed gets a foothold a manages to hold the field to the selves and the scrubs, you soon s a lot of scrubby pure-breds. Co petition between the breeds is a fi

Has *your* farm a scale?

Is your farm the modern type, run just as any business—with just as accurate a check on money and goods coming in and going out? Do you control farm profits at the point where they are often made or lost — *weighing?*

Every farm run for profit needs the protection of a dependable scale — *right on the farm.* You can put this big-value Fairbanks Wagon and Stock Scale on your farm at a very moderate cost. You can use it for all your wagon and stock weighing.

This scale will save you money and time — make unnecessary tedious trips to public scales. It will protect your profits in every buying and selling transaction.

Your dealer will be glad to show you this scale, and explain the finely built mechanism that insures sustained accuracy and dependability.

hing, that is why the O. B. B. olumn is a fine thing and why fairs re fine.

There are only about 10,000 uernsey breeders in the United tates and about 90,000 breeders of ther cattle. There are 900,000 reeders of scrubs who need Jerseys r some other breed, Mr. Main, but s long as pure-bred men are too busy inging brickbats at one another they ill have to be content to milk cows or little or nothing.

Try our plan awhile. We sell bull alves to our neighbors for very ominal prices, being careful to see nat they get the registration papers nd either a three years' subscription o Hoard's Dairyman or a one year's ubscription to the Guernsey Breeders' Journal, whichever we think will ppeal to them most. In this manner we have placed thirty bulls in the ast five years within ten miles of s. The farmers are very enthusiasc about their young grade Guernseys and some are on our list for heir second bulls and some have ought registered females. Don't ollow the short-sighted policy of sellng animals without the papers and ee that he gets the paper to read. ou will be surprised at the results a few years. No use to try this ith scrubby pure-breds.

I have read The Jersey Bulletin or 22 years, and think it a very fine aper. Suppose you read the Guernsey Breeders' Journal that long and hen try comparing the two breeds. ou just would not attempt it unless mebody came out with a line like Butterfat" had.

Virginia. A. G. INGHAM.

An Alfalfa County

HOARD'S DAIRYMAN:—By some of e best authorities in the United ates, Moffat County, Colorado, is an eal dairy country. We can raise the st cow feed in the world of the best ality alfalfa and lots of it. In 1925 a measured field I raised over ght tons to the acre. After once getng a stand, we have it for life. I ve some I sowed in 1908 which is st as good as it ever was. On an adining farm they have alfalfa that s never been cultivated or reseeded r over forty years and it is still goig strong. Can you beat that anyere else?

If you have too many good farmers d especially good dairymen, send em to the best dairy county in the d U. S. and the most healthful.

I notice in the Dairyman you want ople to tell how they dry off their ws. I simply milk them once a day r five or six days, then skip a day two for three or four times, then them go. I have never had any uble yet. I always milk them dry.

Colorado. F. C. BARNES.

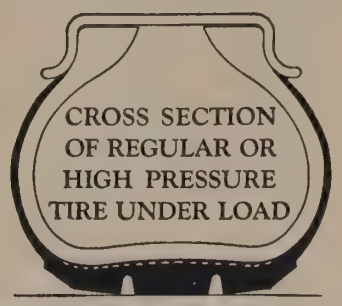
Cut Out Government Control

HOARD'S DAIRYMAN:—This will in probability not get into print but tting it out of my system will, like Fleming says, "ease my mind." ny of us have known, probably for usands of years, that man is "the preme predatory animal." The govment did fix prices during the war guaranteeing a certain price on eat, but *government* was safe in s because we knew there was an sual demand, and in fact I believe market went above the guarand price.

consider myself an ordinary erican citizen. I am 50 years old, e raised a family of three boys, l have been able to support them a reasonable way. In other words, I sider I am normal, yet I confess I e never been able to see any reafor or in government price fixing. People are very notional. Great Britain, years ago, undertook to make the citizens of Boston buy tea. Who is going to make the consumer buy our corn, our hogs, our beef, our poultry, our wheat, our dairy products at his fixed price? Government now has the power to fix the value of money in relation to money, also its value in relation to taxes. But I fail to see anything that gives any authority to government to establish the purchasing power of the dollar.

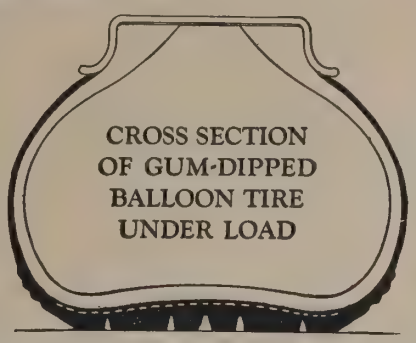
To me C. Fleming's and O. C. Gottesleben's positions are absurd and yet I must agree that there is a radical wrong when the man who grows a bushel of potatoes receives less than 50 cents and the man who eats them pays more than $1.50.

I want to call attention again to the M. F. A., The Missouri Farmers' Association, a product of the show-me state. Last summer our eggs did not go below 25 cents; this winter they have not yet reached 50 cents. When a majority of the packing and storage plants are owned and operated by the producer then, and only then, will the producer receive just and living prices. Food products should not leave the control of the producer until they are in the hands of the retail dealer or the consumer.



Farmers want to sell their products. Our farms could easily produce more than they do if price justified the production.

Consumers prefer to eat our own products but when speculation makes their purchase price exorbitant they buy a substitute. What farmers want is to sell their products high enough so they can produce them and yet cheap enough so the consumer can afford to buy and I, for one, say, for our sake, for the nation's sake, for any sake, cut out so everlasting much government control. It seems to me our nation is like Germany, running to seed on this government control proposition. I think someone has figured that about 4 per cent of us are government officers or employees.



JUST AN AMERICAN CITIZEN.

Missouri.

Scientifically Designed BALLOON TIRE TREAD

THIS type of tire rides more directly on the wide rider strip at the center of the tread. That is where the weight and wear come, so that is where extra rubber is needed. The walls and tread of this tire are thick and stiff, making necessary the use of large tread design for high pressure tires.

THIS type of tire—low pressure Balloon—carries the load on a wider surface, therefore grooves are cut directly in the center of the Firestone Tread to permit easy flexing. Greater amount of Rubber is placed at outer edges of tread where most of the load is carried. Instead of large, heavy rider strips and projections which retard flexing and cause skidding, the Firestone Tread is provided with small projections and narrow rider strips which increase flexibility and give greater safety and skid-protection.

Another Reason why— Firestone Tires are Better

When Firestone engineers were developing the Balloon Tire they found it necessary to design a tread altogether different from that which is required by High Pressure Tires.

The Firestone tread was not designed with large, massive projections for appearance or to make plausible sales argument. On the contrary, the projections of the cross-and-square tread are small and the rider strips narrow permitting the tread to yield to irregularities and cling to the road, giving the greatest non-skid surface. This tough, pliable tread has the wear-resisting qualities that give thousands of extra miles of service.

The tread, however, is not the only important part of the Balloon Tire. Such a tread as this, designed to yield to every depression of the road, must be placed on the carcass that also has the qualifications to withstand the terrific flexing that this design tread permits. Firestone provides this extra strength and endurance by dipping the cords of the carcass in a rubber solution. By this process, every fiber of every cord is saturated and insulated—to withstand the extra flexing of the Firestone tread.

If you want the economy, comfort and safety of Gum-Dipped Tires—see the nearest Firestone Dealer. He will gladly explain the many features that make Firestone Tires better.

New Side Wall Window

Galvanized Steel Sash and Frame

Designed for masonry, hollow tile and wood walls, absolutely tight, frame is mortar filled and becomes solid part of wall. Lasts a life time and is absolutely fireproof. Will never swell and stick. Will never warp, shrink or dry out. Heavy ribbed glass is not easily broken and will throw the light all over the barn. Tilted, permits ample winter ventilation over top without direct draft on animals. For summer—tilted and also raised allows greater air volume than any other window.

Clay Barn Equipment Catalog — *Sent Free*

Shows complete equipment for the modern barn. Stalls, Drinking Cups, Pens, Litter Carriers, Ventilators and other money making equipment. Buy no equipment until you know the Clay line. Drop us a card today.

Side Lights On Co-operation

A. CORNELL, IDAHO

No. 4

IN the promoting of a co-operative project it is natural to emphasize the necessity and importance of a sufficient sum of money and the ease with which this sum can be made available when many interested people buy stocks and bonds. The general superintendency of all co-operative concerns is placed in a board of directors whose important duty it is to spend money that is not strictly their own. It is not easy to find men who spend even their own self-earned money wisely. There is a great deal of the element of habit in this matter of spending money. If one is in the habit of looking closely to values in spending his own money, he can be expected to do so in spending community money.

Habit is of no less importance in acquiring money. Material acquisitiveness is a very dominating trait and it is usually, but not always, narrowly selfish. Those who have been especially acquisitive in their own affairs are usually thought of first as desirable candidates for co-operative directorates. However, this very thing should call for more than ordinary caution, because, if their acquisitiveness is narrowly selfish, they may be good directors only when they can be so without any sacrifice of their narrow personal interests. Directors must be chosen because they are temperamentally socialistic (we are not speaking from a partisan standpoint, for the most narrowly selfish of men often boast loudest of their socialistic party tag and those who never think of voting the socialist ticket are often the most broadly social).

Granted that a board of directors are chosen who devote themselves to determining values for their corporation, there yet remains two distinct classes of values, namely material values and moral or spiritual values.

Material values have to do with building and mechanical equipment. These are standardized commercial products whose qualities and performance can be observed and tested in a cold, calculating, impersonal way. This is to say, if you and I as directors have under construction a brick building and I have reason to suspect that a wall of that building leans out from the perpendicular and you think my imagination is playing me a trick, we do not have to debate and parley until the wall topples; we can apply the plumb. If it leans, we know it will not straighten itself and we can proceed to reject or rebuild it.

However, if the rectitude or the capability of a worker or a manager is under consideration, it is not so simple a matter to apply a test that will be conclusive and final. Even if we are thoroughly convinced t there is a serious fault in either performance or in the purpose of person in question, we may still far apart as to the proper disposal make of the man. He may be cient in other ways, or he may be friendly and pleasant that we can kick him out; or he may have a fa ly that we do not want to disgr or distress. In fact, there may one or many of hundreds of possi complications that will give rise toleration and indecision on our p and all the time matters going from bad to worse.

These are facts that apply even the most individually owned and p sonally managed concerns. Whet they have multiplied significance der a board of directors of a co- erative corporation largely rests on whether the members of t board are devoted to their narr selfish interests or to their broad enlightened selfish interests. It well to understand, right from start, that co-operative concerns h to face the disadvantage of having vest general superintendency in board of directors whose person is scattered and whose years of votion to agricultural and mechani occupations have not contribu greatly to making them quick and cisive actors where a lack of ch acter or of capability weighs in balance against human qualities t give rise to strong human atta ments.

Co-operation is often criticised parsimony in the employment managers and helpers. This critici is based on the theory that good m agement can be insured by pay high salaries. This criticism is m by those who are inexperienced employing help. It is doubtless t that those who have already pro their value to a business organi tion are sometimes allowed to when a more liberal salary would tain them, but in view of the f that high salaries are likely to r upon the element of brazen self p motion on the part of the candid for the job, directors have to be v cautious about employing manag at their face value. True worths not characterized by the grea ability for self promotion.

Co-operation is enlightened selfi ness and enlightenment ari through the functioning of the f intelligence of mankind. The "f intelligence" of a community is ne corralled into any formal board directors. Free intelligence is t which expresses itself through free thought that results from man experience and the free spe and the free press that expresses observations of all who scrutinize reflect upon human affairs. This

Hubbard Creamery, Minnesota, is a farmers' co-operative organization with 100 stockholders, operating since 1897. This new building cost approximately $19,000 and was partly paid for from the profits of the company and the balance of the funds was raised by 6% bonds. Some of the machinery of the old plant was used. Butter is made and sold on the New York City market. There are about 225 patrons.

why it is always the part of wisdom for directing boards, as well as editorial boards, to be composed of men who are broad minded enough to encourage the expression of "brickbat" opinions as well as "bouquet" opinions. Men who lack this breadth of mind are poorly fitted for such positions.

Guernsey Breeders of Wisconsin Meet

The annual meeting of the Wisconsin Guernsey Breeders' Association held Feb. 1 at Madison, Wis., was the best meeting this organization ever held. There was a record breaking attendance of approximately 200 and the Guernsey men there were very evidently interested in their organization as well as in the meeting. Credit for a good deal of the success of the meeting and for the work the association has done the past year or two belongs to its officers and directers.

The report of Secretary Hulburt showed the association membership to be less than 100 about what it was a year ago, but with a good many new members included in the list. During 1926, the association adopted a label for Guernsey products and already a number of individuals and firms have been granted permission to use it.

To remedy the small membership, the meeting voted the adoption of a plan whereby individual memberships would still remain $2.00 but if an entire county association wished to join it could do so with a membership fee of 50c per member. The Waukesha Co. Association with a membership of 200 took advantage of this offer within the week.

Secretary Musser pointed out to the breeders that they have a direct responsibility in the improvement of dairy cattle. If registered Guernseys continue to improve in producing ability they will in turn have a direct influence in the improvement of the production of dairy cows generally.

Ralph Tratt, C. H. Hulburt, and H. W. Griswold were re-elected directors. Dr. W. A. Munn was re-elected president and Gavin McKerrow was elected secretary.

Brood Sows After Cows

I am running my six brood sows behind my 15 Holstein cows. The cows are getting 100 lbs. total daily of a mixture composed of 400 lbs. of ground corn, 300 lbs. of ground oats, 200 lbs. of bran, 100 lbs. of linseed meal, 100 lbs. of a commercial dairy feed, salt, and minerals. In addition to this, the cows are fed all the silage and alfalfa hay they will eat. The sows seem satisfied as to appetite. Are they getting enough of the right kind of feed?

Wiota, Iowa. M. D.

Where cows are fed ground grains and no silage, the feeding value in their dung for swine is materially lessened from that where cattle are fed whole corn and silage as in steer feeding. Inasmuch as there are 2½ sows for each sow and the cows are full fed, we would expect these sows to be kept in reasonably good condition provided the corn in the silage was fairly mature. The best answer to the question may be found in the condition of the sows. Pregnant brood sows should be made to gain slightly from conception to farrowing. They should not be excessively fat at farrowing time.

In order to insure the sows getting enough of the right kind of protein, together with calcium or bone building mineral, we suggest that they be fed alfalfa hay in a rack in addition to what they get after the cows.

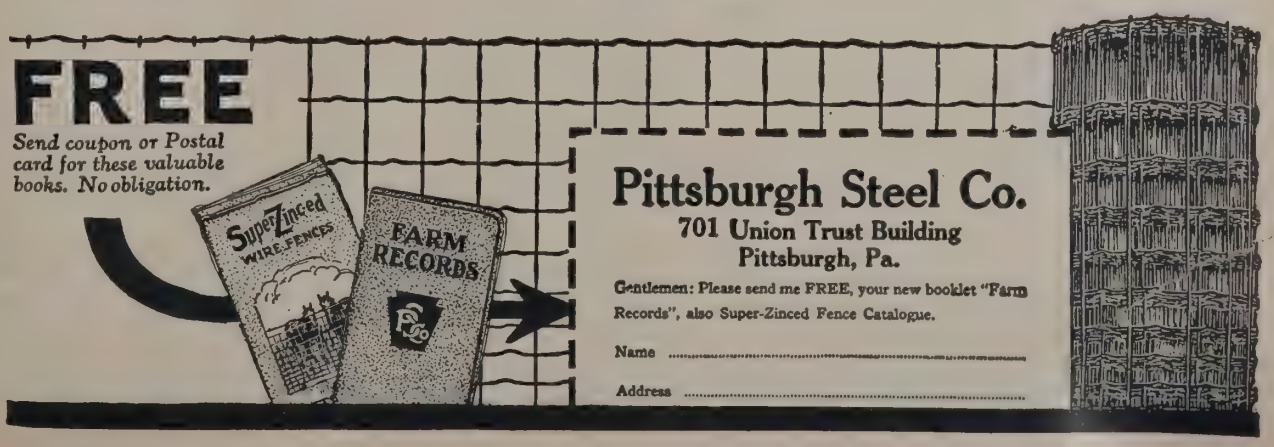
Canadian Prices Lower

HOARD'S DAIRYMAN:—Too much moisture is almost as great a drawback to agriculture as too little. If press dispatches can be relied upon, United States farmers had reason to come to this conclusion last season, and we in Ontario are thoroughly convinced of it. I believe that most of us would prefer a thorough-going drought to continual rain. Never were crops harvested with greater difficulty than in 1926 and still much corn is unharvested in sections. As a result, feed is not so abundant or as good as in normal years and in some sections there is an acute scarcity.

From the marketing standpoint, 1926 was somewhat of a disappointment. Prices of both cheese and butter were lower than in 1925, cheese by four cents a pound and butter by five cents. It was hardly to be expected, however, that we would have a repetition of the banner year of 1925. Prices were advanced beyond normal in the former year by the seamen's strike in Australia and New Zealand, which retarded supplies from that source and artificially boosted the price level in Great Britain. These supplies came forward later to influence the market of 1926 and on top of that was the coal strike in Great Britain. Many industries were affected and the buying power of the British people depressed. Thus we had abnormal conditions in both years but working in opposite directions. Conditions are rapidly returning to normal in the Old Land and more satisfactory conditions are anticipated for 1927.

The foregoing illustrates how dependent are dairy produce markets on world wide conditions—where a country has a surplus for export. Canadian dairymen are watching with interest the efforts in the United States to induce Congress to adopt legislation whereby the surplus will not set the price of farm products consumed on the home market; also the working of the Patterson scheme in Australia, where the creameries have taken the matter in hand without seeking legislative aid. In Canada, however, the cultivation of the foreign market is vital to the progress of the dairy industry and we are more apt to seek success through improved quality, better marketing methods, and lowering cost of production than at the expense of the home consumer.

Canada. F. E. ELLIS.



Good fences make a big difference in the size of acres measured *in profits.* The biggest acres in profits always belong to the farmer who rotates crops and raises hogs, cows and chickens. *More acres* simply mean more taxes, but *bigger acres* through modern farming keeps down taxes, saves hired labor, increases profits and adds to the fertility of the soil. See your dealer now for those fences you need to make your farm yield larger profits.

SuperZinc-ed REG. TRADE MARK "Pittsburgh Perfect" and Hinge Joint Columbia Fences

mean bigger acres and larger farm profits because they provide the first essential to modern, diversified, profitable farming, which is hog-tight enclosures. They are made of special formula steel and Super-Zinced against rust by an extra heavy coating of zinc so closely bonded to the steel that it will not crack or peel. They enable you to have complete control over crops and live stock, and to operate your farm with the utmost economy and profit.

Super-Zinced Fences meet every requirement for field, poultry, garden and lawn enclosures and are *guaranteed unexcelled in quality and durability.* For the same high standard of quality insist also upon our brands of barbed wire, gates, steel posts and wire nails. Be sure to send for your copy of our new vest pocket booklet "Farm Records" which will be mailed free, together with Super-Zinced Fence Catalogue and name of nearest Super-Zinced Fence dealer.

EDITORIAL COMMENT

SUCCESS in dairying does not depend so much on the high prices of dairy products as it does on cheapening the production of feed.

DO COWS NEED EXERCISE?

The question of exercising cows has been debated many times at dairymen's conventions. The opinions in reference to the benefits of exercising dairy cows have been divided.

The Bureau of Dairy Industry of the U. S. Department of Agriculture conducted an experiment to determine whether exercise would increase the milk production and improve the health of the herd. One lot of cows was walked three miles a day and another lot was turned out in the yard. Careful records were kept of each lot as to feed consumed, milk and fat produced, and the general condition of each animal included in the test. In time the procedure was reversed and those cows that had received exercise by walking three miles per day were kept in the yard and the others taken on the hike.

The cows that received the exercise by walking produced a little more milk and it tested a little higher than those remaining in the yard, but the exercised cows consumed 8 per cent more feed. So far as could be observed they showed no better health when being exercised than when confined to the yard. Additional experiments will be required to establish definitely the effect of exercise on health.

The conclusions of the test were that cows do not need more exercise than they receive in moving about the barn yard. The results of the test, however, show that pastures not yielding a great quantity of feed and which require considerable walking on the part of the cow to obtain a full meal can be used without feeling that there will be a sacrifice in milk production.

PASTEURIZATION OF BY-PRODUCTS

At the annual meeting of the Granite State Dairymen's Association, consideration was given to the feasibility of securing a law to compel the pasteurization of by-products of creameries and cheese factories. It was proposed that no by-products be returned to the farm from a creamery, cheese factory, or processing plant that had not been properly pasteurized.

There is no question about the efficacy of pasteurization when properly done, but it is here that the shoe pinches. We know of no practical way of enforcing such a law and of making sure that upon all occasions the by-products have been properly pasteurized before returning them to the farmers. It is easy to conceive of the operators of a creamery neglecting occasionally to heat the skimmilk to the proper temperature or to hold it for a sufficient length of time to destroy all disease germs. To feed milk occasionally that had not been properly pasteurized would be sufficient to inoculate the calves with tuberculous germs if the herds supplying the creamery were infected with tuberculosis.

New Hampshire is making splendid progress in the eradication of tuberculosis and it seems to us it would be a mistake to enact a law to compel pasteurization of by-products, as this would establish a false confidence. No doubt many operators would thoroughly pasteurize their by-products before returning them to the farmers and could be depended upon to do this 365 days in the year. However, there are bound to be some who would always be careless and others who would be careless at times.

The enactment of a law to compel pasteurization of by-products would naturally lead a great many dairy farmers to believe that skimmilk coming from the creamery or whey from the cheese factory would be safe to feed their calves. This is our chief reason for not favoring a law of this character. We believe it is better that the patrons of such institutions look after the pasteurization of by-products from creameries themselves if they are using them for feeding to their calves, swine, or chickens. We do not believe it is a safe practice for any dairyman to feed skimmilk from a creamery to his calves and especially if an attempt is being made to get rid of tuberculosis or if the herd is free from this disease.

It is our belief that all skimmilk from creameries and whey from cheese factories should be pasteurized before it is fed to calves or pigs even though the herds supplying the creameries have been tuberculin tested and found to be free from tuberculosis. We can not approve of feeding skimmilk to calves from a creamery for we know it is dangerous even though the herds supplying the creameries may be accredited. It is just as important to shut off the avenues of infection as it is to test the herd and eliminate the reactors. There is little use of going to the large expense of tuberculin testing and then be careless in the use of by-products which may again infect the herd.

We do not wish it understood that we are opposed to the pasteurization of by-products; in fact we approve of this process, but we do not believe it is wise for any state to enact such a law because, as stated, it leads dairy farmers in too many instances to put false confidence in the safety of by-products. Furthermore, we do not believe there is any way of successfully enforcing a law of this character.

SEVENTY-SEVEN CENTS AN HOUR

Over twenty-five years ago when Professor W. M. Hayes was chief of the Department of Agronomy and Farm Management of the Minnesota College of Agriculture and Professor Andrew Boss was his assistant, they established several farm statistical routes in Minnesota. The purpose of this work was to gather information concerning the management of farms, the approximate cost of producing various agricultural crops, and to determine, as far as possible, the net income from these crops. Much practical information has been obtained through this work and it has assisted the farmers of that state to practice greater diversification and to increase their incomes.

A dairy bulletin of this work, prepared by Professor W. L. Cavert of the Division of Agricultural Extension and Professor G. A. Pond of the Division of Farm Management, has been issued. It is a clear statement of useful dairy information gathered from 21 farms in Steele County.

On these farms the sales of butterfat furnished 35 per cent of the income, and sales of dairy cattle and veal calves about 17 per cent, a total of 52 per cent of the income. Next to the dairy enterprise, hogs were most important as a source of income, furnishing 25 per cent of the total.

From the summary of the bulletin we take the following statements: "The return per hour for time spent in caring for cows among 21 cost cooperators in Steele County varied from 7 to 77 cents. Three obtained 65 cents or more. The cows produced an average of 192 pounds of butterfat per year. The average return per hour of labor was 20 cents above market prices for feed and other expenses. If the charge for barn rent and horse labor is ignored, the average return per hour for man labor was 26 cents. The principal factors needing attention in order to get a return of 65 cents or more per hour are: Feeding in proportion to production, feeding adequate rations, having adequate all-season pastures, weeding out the poor producers, having cows that are sired by pure-bred bulls of high producing ancestry, effectively controlling losses from abortion, tuberculosis, garget, and other diseases, and a reasonable overhead for barns and equipment.

"High production and a high return per hour usually go together. The most profitable number of cows will usually be determined by the number that can be milked without increase in the cost of hired help over what would otherwise be incurred. Exclusive dairy farming is no more to be commended than exclusive wheat or cotton farming. There should be at least enough hogs and poultry to use the skimmilk to advantage."

We find also in the bulletin this statement: "Many farmers who have had inadequate pasture could increase the returns 15 to 20 cents per hour by getting good all-season pastures." It would be our suggestion that they give sweet clover an opportunity to demonstrate its value as a pasture for dairy cows. We most heartily approve of the suggestion, too, that dairy farmers need to follow diversification just as much as wheat farmers. Under certain conditions it pays to devote the entire farm to milk production, but in most instances the dairy farmer who is making money is diversifying. Those who are devoting all energy to the production of milk, unless under special conditions, are very little better off than the man who is raising corn or wheat or cotton as his sole crop.

FITTING CROPS TO THE HERD

The winter feeding season is far enough advanced to determine the shortcomings of last year's crop program. When a dairyman has plenty of the right kind of feeds he feeds liberally, but when he forsees a shortage of feeds he is inclined to try to "get by" until grass is ready. He frequently turns out before the grass is ready, thereby decreasing the yield. This "getting by" is a doubtful practice, particularly if considered from the standpoint of the better cows that could profitably use more feed. If one must stretch the feed, a better practice is to take out some of the poorer producing cows.

That there is a vital relation between crop production and profit per cow goes without argument. Right now is the time to decide whether the weak places in last year's crop production are to be repeated this year or whether they are to be supplanted with a program that will leave less to be desired next winter.

If one is to put in a summer's labor and the use of land to the growing of crops for feeding, is it not good business to measure the milk produced from these crops in terms of acres of crops grown for this purpose?

We were on a farm the other day where cows were being fed moldy corn silage and marsh hay as roughage. Whether this feeding program has been deliberately planned or was the result of uncontrollable circumstances, we do not know. The cows were in poor flesh, extremely lousy, and covered with more dirt than is conducive to good health or clean milk. That they were unprofitable we have no doubt. Repeating this practice for a few years will most certainly send a dairyman to the poor house and his cows to the shambles.

The dairyman who is able to grow enough succulent feed and legume hay to meet the needs of his herd has the bigger part of his feeding problem solved. The dairyman who could grow these feeds and is not doing so, is the one who needs to revise his crop producing program. He is the one who could now find greater reason for making some changes by reason of finding the hay mow nearly empty and the cows in poor condition.

Hundreds of dairymen are increasing their acreage of alfalfa this year because they have begun to measure milk production in terms of crops grown for feeding purposes. Others are increasing their acreage of sweet clover for pasture because they have learned how to get more money from an acre of this pasture turned into milk than from an acre of any other crop they have ever grown for pasture. There are thousands of dairymen on the fence, undecided as to what to do. These are the men for whose benefit this bit of argument and persuasion is published.

Time flies and if the decision has not already been made to revise the crops grown to better fit the needs of the herd, it will soon be too late. Talk with your neighbor who has worked out a crop producing program that gives him more milk per acre than you are getting. Find out how he does it. But do it now, for tomorrow may be too late.

Crops for Silo

I am thinking of erecting a tile silo or two next fall. Will you please help me to find out what I can most profitably raise for ensilage, corn, feterita, cane, sudan grass, artichokes, mangels?

St. Edward, Neb. J. I. C.

Where corn is a sure crop, it provides the best and most economical source of silage. In regions where there is not always sufficient rainfall to mature a good crop of corn, cane or one of the other sorghums will make a very good substitute. Sudan grass may be ensiled, particularly as an emergency crop, and gives satisfactory results, although we would not ordinarily rely upon it as the main silage crop. Artichokes have been used to some extent as cow feed but there has not been sufficient experience with them to warrant a definite statement as to their value. Mangels are not ensiled but are stored in pits or root cellars. We have recently had our attention called to the fact that some men are running in one mangel to every one or two bundles of corn when they ensile their corn. They believe in this way they get a more palatable silage.

Service Charge for Partnership Bull

Please give me information about a partnership bull in regard to keeping him. There are three of us that bought this bull. One has 20 females, one has 12, and one 10. The bull will be kept at the place that the 20 females are kept. The bull is two years old. The two herds are one and a half miles from the place where the bull is to be kept.

Louisville, Ohio. N. B.

We always hesitate to suggest actual prices for services rendered because conditions vary so much in different sections of the country and what may be suitable and fair in one section will not always be applicable to another section. Then, too, local practices and conditions very often govern matters of this kind. It is a good deal like attempting to fix prices for products all over the country on the basis of certain cost of production studies. Unless one is very careful in his interpretation of these costs, he may be led astray in arriving at a proper conclusion.

Various costs of production studies indicate that the annual cost of keeping a bull may be based on the following figures: grain 500 to 1,000 lbs., hay tons, silage 1½ tons, and labor 40 hours. The cost of these items plus interest on the investment in the stable and exercise yard may be reasonably estimated at approximately $100 a year. In this case, no account is taken of the money invested in the bull nor is any charge made for depreciation in the bull, as each of the present three owners are already bearing an equal part of this charge.

Assuming that the annual cost is estimated at 100 and service is to be provided for 42 cows, the average service charge per cow would be about 2.50. On this basis the 10-cow herd would pay 25 and the 12-cow herd $30. The owner of the 0-cow herd, where the bull is kept, would receive his $55 and, in addition, free service for his herd. In some respects this arrangement is not wholly fair as the lack of convenience for the two other farmers might well offset a portion, at least, of the expense of keeping the bull. The contributions of the small herd owners might be reduced by 25 per cent to 50 per cent to compensate for their extra labor and convenience in bringing their cows a mile and a half at the time of service.

We would suggest as a matter of convenience and possibly to avoid dispute that no charge be made for each individual service but that each owner make his payment annually upon an agreed upon rate. The annual payment would necessarily be revised from year to year as a previous year may have shown one or the other of the present owners of the bull to have increased or decreased the size of his herd.

Cows Are Underfed

I am feeding from 45 to 50 lbs. of silage per head daily plus one bundle of green leafy fodder corn to each cow. The cows get no hay of any kind. My concentrates mixture is a 20 per cent protein commercial dairy feed. I am feeding this at a rate of one pound for each 3½ to 4 lbs. of milk produced daily. My cows have been in milk from 8 to 10 weeks; the tests range from 2.8 per cent fat to 4.1 per cent fat; the production from 35 to 45 lbs. of milk daily. Is my ration all right?

Hastings, Minn. F. E. C.

If we assume that one of these cows weighs 1100 lbs., that she produces 40 lbs. daily of 3.5 per cent milk, that she is fed the equivalent of 50 lbs. of silage, that she receives 11 lbs. of the concentrates mixture which is a rate of 1 lb. for each 3½ lbs. of milk, we find the ration does not supply enough protein and total nutrients to meet the requirement according to the Haecker feeding standard. The above quantity of feed supplies 2.42 lbs. of digestible protein and about 17.25 lbs. of total digestible nutrients; the requirements for a cow of this size and production are 2.73 lbs. of digestible protein and 20 lbs. of total digestible nutrients. If the corn fodder contains a normal proportion of ears and is of such quality that the cows clean it up fairly well, it is likely the cows are getting nearly enough of total nutrients, otherwise it is probable that these cows will first be reduced considerably in flesh and thereafter decline fairly rapidly in production during the last half of the lactation. If they were in good condition when they calved, they will produce fairly close to their normal production for about the first third of the lactation period. By this time they will have begun to be noticeably reduced in flesh and this will continue somewhat to a point where the production will be lowered. After this their weight will remain fairly constant but their production will decline more rapidly than it otherwise would had they been in good flesh when they calved and adequately fed thereafter.

It is not likely these cows can be induced to eat more roughage. The additional nutrients needed must be supplied from the concentrates and this would need to be fed at a rate of about 1 lb. for each 3 lbs. of milk produced daily. One should not rely wholly on an arbitrary rate to feed grain, but should guage the feeding according to the condition and production of individual cows.

Unless the commercial dairy feed has included in it mineral substance that supplies calcium and phosphorus, we suggest these cows be given free access to a mineral mixture composed of equal parts by weight of salt, bone meal, and finely ground limestone. The reason for this is the fact that no legume hay is included with the roughage and the silage and fodder are both low in calcium and phosphorus.

Choosing a Breed

I am just starting farming and want to get into one particular breed of dairy cattle. I live in the southwestern part of Wisconsin, among the hills and rocks. I am planning to get in either Holsteins or Guernseys. Which would you recommend where the milk is taken to the American cheese factory? Which of these breeds has won the most records?

Wisconsin. PERPLEXED.

In most cheese factory districts the Holstein cow is most popular. This is because of the relatively larger flow of milk and its particular suitability for making cheese. Where the cheese factory pays on the basis of test, it is not quite so advantageous to produce Holstein milk, but even so, the Holstein will be preferred by most producers of milk for cheese factories.

The Holstein will, on the average, produce 100 pounds of milk at a lower cost for feed and labor than will the Guernsey, but she will not, as a rule, produce a pound of butterfat quite as cheap. However, a fair to good Guernsey will produce milk at a lower cost per hundred pounds than will a poor to mediocre Holstein.

The census of 1920 showed something over a half million pure-bred Holsteins and over ten million grades. Calves of this breed will weigh from 70 to 105 pounds at birth. Mature bulls will weigh in the neighborhood of a ton or more, while mature cows will weigh in the neighborhood of 1,200 to 1,300 pounds. There have been 25,431 Holstein cows that have finished a year's Advanced Registry test. The average production of these cows is 15,720 pounds milk containing 533 pounds fat, the average test being 3.4 per cent. There have been 109 Holstein cows that have produced in excess of 1,000 lbs. butterfat in a year, and there are 74 that had yearly records above 30,000 pounds of milk. The highest producing Holstein cow has a record of 33,465 pounds milk containing 1,349 pounds fat.

According to the last census, there were 80,000 pure-bred Guernseys in the United States and nearly two million grades. Calves will weigh in the neighborhood of 75 pounds at birth, mature cows about 1,100 pounds, and mature bulls about 1,600 pounds. There were 22,165 Guernsey cows and heifers that have completed a year's Advanced Registry record. Their average production is 9,664 pounds milk containing 482 pounds fat, the average test being 5 per cent. There are 9 Guernsey cows that have produced in excess of 1,000 pounds of butterfat in a year, and there have been 8 Guernsey cows that have produced in excess of 20,000 pounds of milk in a year. The highest producing Guernsey cow has a record of 19,742 pounds milk containing 1,113 pounds fat.

While a comparison of the foregoing records is desirable, yet it can not be expected that the average owner of either of these breeds will be able to secure this production. These records have been made under specialized conditions and not under what would be termed ordinary farm care, and the animals to a very considerable degree are exceptional representatives of their breed.

The major consideration is, first, to consider the market for the product of the cows, the relative economy of production of the breeds as breeds, the personal preferences of the dairyman, and, finally, and most important of all—the wise selection of good animals of the breed that most appeals to the prospective owner. There is more difference in the productive capacity of cows within a breed than between the breeds themselves. There are good animals and poor animals in all breeds, and profit will be secured only as a man exercises care in purchasing good animals and then rigidly eliminating from his herd those that fail to produce up to expectations or fail to produce at a profit.

Pasteurizing in Bottles

I would like information as to the economy in operation and the practical use of a bottle pasteurizer. These pasteurizers have been installed in some small dairies in this territory. Have heard arguments pro and con in regard to them. Could you enlighten me as to the following questions? Will they produce a better cream line than a vat pasteurizer? Do you consider milk cooled in bottles in the process of pasteurization, a good method? What system of pasteurization do you deem the most practical for a small dairy?

Wooster, O. H. S.

In their book entitled "Market Milk," Kelly and Clement have the following discussion concerning the pasteurization of milk in the bottle:

"With the in-the-bottle system of pasteurization which has been developed in recent years, the milk is heated, held, and cooled after it has been put into the bottles. There are several types of in-the-bottle pasteurizers. With some types the bottles of milk are placed in a compartment and the milk heated by sprays of hot water. The milk is held for thirty minutes in the same apparatus after it has been heated to 145° F. and is then cooled by changing from hot to cold water. With another type the bottles of milk, after being removed from the cases, pass slowly through the machine, being heated at the beginning and cooled at the end of the process. It takes thirty minutes for the bottles to travel from the point at which they are heated to the desired temperature to the point where cooling is begun.

"The following are some of the advantages of pasteurizing in the bottle:

"1. Operation is comparatively simple.

"2. For a small dealer the first cost is comparatively small.

"3. There is little chance of recontamination of the milk after pasteurization, provided water-tight caps are used and bottles do not have to be recapped.

"4. The bottle, as well as the milk, is heated.

"5. In some cases, small plants can save space by the use of this method, as the pasteurizer serves also as a cold storage room.

"6. There are no pumps, pipes, or other apparatus to clean.

"The following are some of the disadvantages of in-the-bottle pasteurization:

1. The system is rather slow for a large commercial plant. For a small plant, however, this objection may not be serious.

"2. Considerable extra steam and refrigeration are required, as it is necessary to heat and cool the bottles, caps, and cases, in addition to the milk.

"3. During the heating process, the milk will expand in the bottle, so that unless a bottle of extra capacity or a special and more expensive cap is used, many of the bottles will have to be recapped after cooling, because the expansion of the milk will force the cap out. It is advisable to use a bottle of extra capacity, since recapping, besides causing considerable trouble, may contaminate the milk. Where extra-sized bottles are used they contain full measure of milk, but there is some empty space between the top surface of the milk and the cap to allow for expansion during heating. Such bottles do not appear full when delivered, and thus cause some complaint among customers."

If any of the readers of Hoard's Dairyman have had experience with "in-the-bottle" pasteurization, we would appreciate their courtesy in giving us replies to the specific inquiries of H. S.

Biggest Value on the Market!

Read what farmers actually say about Fords Milker:

"It is the best milker on the market regardless of price."
"I like it fine. Works just as good as a high priced milker."
"Three features of Fords Milker appeal to me—price, simplicity, and service."
"Milks just as good as milkers that cost a great deal more."

Our new, improved model makes this the finest milker on the market. Heavy aluminum pail; General Electric Motor; New Departure Ball Bearings. Durable, simple to operate, easy to clean. Practically no expense for upkeep.

Farmers are enthusiastic about it. Easy on cows' udders and cows take to it better than hand milking. Practically no stripping necessary.

Electric models complete with motor. Gas engine outfits complete except engine. Prices east of the Rockies: Single unit $90, double unit $120, complete ready for milking; also larger outfits.

BUSINESS THE E-B LINE FOUNDED 1852

Count the cost you won't have

Just as sure as you investigate the upkeep cost of spreaders you'll decide that an Emerson-Brantingham is what you want. Get all the figures. Then this fact will stick in your mind—the average upkeep cost per year for 30,000 E-B Spreaders was $1.03 per spreader! We know the exact figure because we make the repair parts—and we make mighty few.

On top of economy of operation is ease of operation. The E-B Spreader spreads seven feet wide. Consequently it travels little more than half the distance other spreaders must travel to cover the same area. It turns a square corner, drives through a six foot door, and the tight bottom prevents loss of liquid manure. The 41-inch height makes loading easy. Mail the coupon for full description of this spreader or any other implement in the E-B line—economy is the watchword of the E-B farmer.

The First Cattle in America

THE following history of the introduction of cattle into America is taken from an address delivered by Colonel R. M. Littler of Iowa before the Northwestern Dairymen's Association in 1882:

The first cattle imported into this country was about the year 1609; then civilization began. The following year, or 1610, several more cows were imported, and in 1611 there was what was considered at that time, so the historian recites, a very large importation of cows. About 100 head were added to the herds in the Old Dominion. So the state of Virginia can lay claim to being the mother of the dairy industry, in connection with her title as the mother of presidents.

Soon after the period alluded to, other cows or cattle were imported from the West Indies, supposed to be descendants of those brought over by Columbus in 1493. The Virginians valued their animals so highly for working and for producing milk, cream, and butter, that in order to promote their increase, a law was passed forbidding the killing of cattle on penalty of death. It seems from the record that the herds increased very fast, both from importations and breeding, for in 1620 there were five hundred head of cattle in Virginia; in 1639 there were thirty thousand. Now, I presume these figures are correct and from official sources, for even in those days the assessor and tax collector were known. I believe it was a little matter of tax that inaugurated that movement in the colonies which resulted so happily for us all.

New England derived her stock of cattle largely from Virginia, though history tells us that Governor Winslow made the first importation in 1624. This was a valuable herd of three heifers and a male animal. These were owned in common by the Pilgrims. In 1626 twelve cows were sent to Cape Anne Colony; in 1629 twenty more cows were imported by the New England colonists, and in 1630 Massachusetts colony received an invoice of one hundred more. New York was indebted to the Dutch for her cattle. Whether the debt has ever been paid I do not know, but we presume that Vanderbilt or Jay Gould will pay it if they do not wish to go to law about it. The Dutch West India Company brought over to New York one hundred and three horses and cattle for breeding. The Swedish West India Company introduced cattle in Delaware as early as 1627; in 1631, 1632, and 1633 brought se cattle to New Hampshire. In as the colonies grew in numbers the country was developed, the h of cattle imported from these se countries were exchanged back forth amongst the colonies, be inextricably mixed, and the com cattle of the United States is th sult.

The earliest account we hav cattle in the great Mississippi V states that in 1770 cattle brought to St. Phillip by the ca of militia—whether it was one J of the horse marines or not, the torian does not tell us. The set at Cahokia (St. Louis) at that day were slaves, cattle, and pou In 1800, Reynold states, cattle abundant in Illinois, and that plowing and hauling were gene done by cattle, without distinctio kind or breed. The harness cons of a straight yoke of wood, which tied to the horns of cattle by st of leather or rope. This valu service of the cows may account the scarcity of hornless or polled tle in this country. These c were small and hardy, and brought by the French settlers Canada. It is also recorded of t cattle that they stood the winter ter without grain than the Amer cattle from New England, York, or Virginia; that they much less milk in summer "risked more all the time." The tom was to let the calves run the cows, but little interest was t in buttermaking.

As civilization advanced, dom cattle kept pace with the marc improvement and helped to cheer sustain the hardy pioneers in t arduous labors. In 1850 Amer cows were driven across the plai California. The climate of Califo was pronounced by the forty-ni unfit or unsuited for dairying. T however, had formed their opi because the native or Spanish found they were so notoriously for milking. However, Yankee t soon found that it would pay to gage in dairying in that land of and in 1855 dairying was well i gurated.

Salesmanship

Passerby: Here, boy, what's you were shouting? "Great swind 60 victims!" I can see nothing a it in the paper.

Newsboy: That's the swindle. are the 61st.—Good Hardware.

HARVEY KERN OF INDIANA AND HIS BELGIAN STALLION, "CAMILLE," THAT SIRED MORE GOLD MEDAL WINNERS THAN ANY OTHER STALLION IN THE STATE IN THE HOOSIER GOLD MEDAL COLT CLUB OF 1926

This contest was conducted by the Indiana Live Stock Breeders' Association and Purdue University Extension Department with Mr. P. T. Brown in charge. This gives to Mr. Kern the Premier Sire Trophy offered by the Indiana Draft Horse Breeders Association and also the Belgian Trophy offered by the American Belgian Association.

Wisconsin Dairymen Meet

The 55th annual meeting of the Wisconsin Dairymen's Association was held at Madison on February 1. The meeting was well attended and the members again renewed their enthusiasm for the work that is being accomplished by that association, particularly for its development of cow testing association work in all its various phases.

The program for the meeting was well balanced with speakers of professional as well as farm experience. Secretary Conklin of the Ayrshire Breeders' Association discussed the herd test plan and showed definitely how it was based on the principle of raising the breed average rather than to secure exceptional records on a few cows. The plan is growing in popularity and influence. Cow testing association members and testers told of their experiences in testing and the gains made through this work.

Selective Registration Endorsed

One of the resolutions of outstanding importance that was adopted concerned itself with the problem of selective registration for pure-bred cattle. The resolution reads as follows:

"WHEREAS, the success of dairymen in dairy cattle and milk production is dependent on dairy cattle of most approved type and character, and

"WHEREAS, much of the improvement in dairy cattle is dependent on inherited factors relating to both milk production and good type which are transmitted from one generation to another through a most careful registration and selection of animals, and

"WHEREAS, the present method of registering animals for pure breeding in so many instances is in name only and is inadequate for best results; therefore, be it

"*Resolved*, That the Wisconsin Dairymen's Association favors a careful consideration of selective registration based on purity of breeding, good type, and production records which will permit not only the breeders of pure-bred dairy stock but breeders of high grade stock to make greatest progress."

An increase in the legislative appropriations for the Wisconsin Dairymen's Association from $6,000 to $10,000 was asked for, and members were urged to get in touch with their representatives in the state legislature and request their support of this cause that the association may meet the demands of farmers for the further extension and proper supervision of cow testing association work. An investigation of bovine mastitis by the Agricultural Experiment Station was urged and the regents of the University were requested to provide for this. The Milwaukee Association of Commerce was commended for its efforts in introducing milk for the christening of a new lake vessel, with similar approval given the Wisconsin Manufacturers' Association for its gift of $50,000 toward an investigation of abortion. Approval was also given to the establishment, if found practical, of regular cow testing associations operated through high school students.

Process Cheese

"WHEREAS, the growth and success of the dairy industry," reads the fourth resolution, "is dependent in a large measure on the quality and standardization of dairy products, therefore, be it

"*Resolved*, That the Wisconsin Dairymen's Association approve the proposal of federal legislation to define and control the manufacture of process cheese not only as a protection to the consumer but also to protect the honest manufacturer and the industry as a whole from fraudulent practices."

Mass Production and Marketing

"WHEREAS, it is generally conceded and has been demonstrated that a wider application of the principle of mass production and mass marketing through co-operative action has resulted in a material gain in the dairy industry and

"WHEREAS, through the improvement of Wisconsin highways there is opportunity for combining and enlarging creameries and these factories in a manner to permit the employment of more expert help and to provide for better facilities for the manufacture of high quality products and thus further the possibility of marketing such products through such organizations as the Land O' Lakes Creameries' Association and the Wisconsin Cheese Producers' Federation, therefore be it

"*Resolved*, that the Wisconsin State Dairymen's Association indorse and approve all of these developments."

The officers elected for the ensuing year were: W. J. Dougan of Beloit, president; Ed. Korrer of Fond du Lac, vice-president; and Paul C. Burchard of Fort Atkinson, secretary.

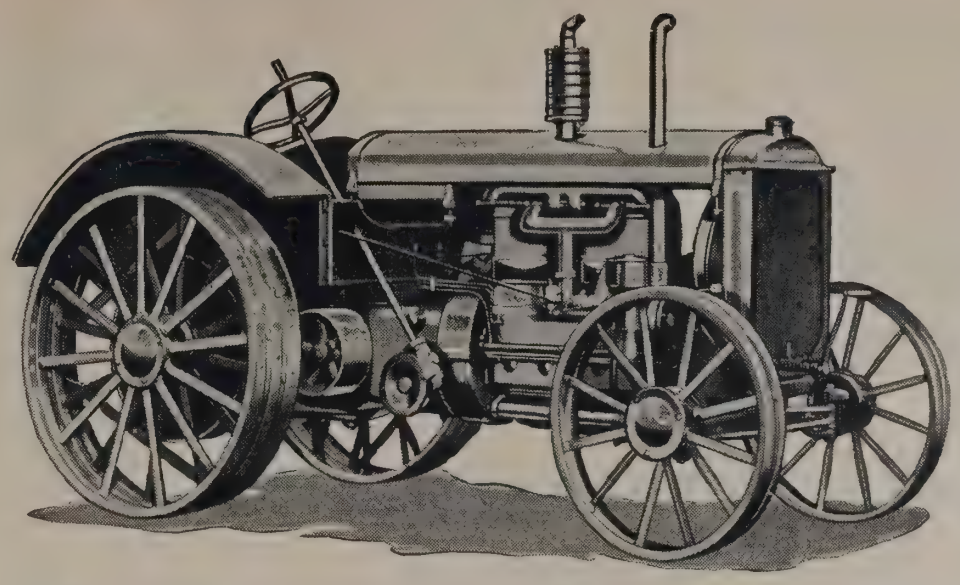
Canadian Ayrshire Meeting

Officers' reports given January 27 at the annual meeting of the Canadian Ayrshire Breeders' Association showed that organization to be stronger than ever before in its history, which in turn is a very definite indication of the increasing popularity of Ayrshires in Canada.

Secretary Stephen's report showed a larger paid up membership for 1926, and a decided gain in registrations and transfers. Liquid assets of the association now total $10,750.

The meeting voted a protest against the rule now in force which does not provide for a man to accompany live stock shipments.

Dean Burton of McDonald College and R. R. Ness of Quebec both pointed out the fact that the time had about arrived when bulls should not be registered until they are inspected and passed for Advanced Registry. They also suggested the desirability of a system of inspection of females.



Officers elected for 1927 are A. Hume, president; J. H. Black, vice-president; and W. F. Stephen, secretary.

Minnesota Cow Produces Over 33,000 Lbs. Milk a Third Time

Final figures just announced on the record completed last November by Grahamholm Colantha Segis Maid credit her with 33,545.6 lbs, milk containing 1,053.27 lbs. butterfat (1,316.58 lbs. butter) produced in 365 days as an 8-year-old cow.

This is "Maid's" third record in excess of 33,000 lbs. of milk. As a 5-year-old she produced 33,112.3 lbs. milk, 984.85 lbs. fat in a year. During her next lactation she produced 33,811.6 lbs. milk, 1,033.28 lbs. fat in 344 days; 32,155.1 lbs. milk, 974.43 lbs. fat in 305 days; and as an 8-year-old cow made her third big record given above.

Grahamholm Colantha Segis Maid was bred and is owned by Dr. Christopher Graham of Minnesota. She is the seventh Holstein cow to twice produce over 1,000 lbs. butterfat, and ranks 43rd among all Holstein producers.

The Greatest Tractor Ever Built

from stem to stern, sealed against grinding grit—
Oil Purolator, Gas Filter, Air Washer insure double life

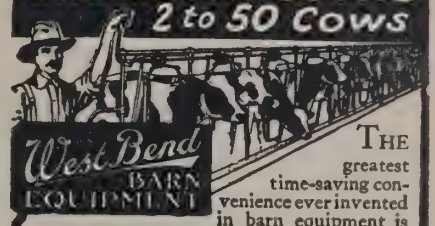
After 12 successful years with farm tractors, this old, established, world-famous power plant builder announces the cleanest tractor ever built! Therefore, the tractor with the longest life! Read the list of remarkable cleaning devices now given as standard Allis-Chalmers equipment. At a low estimate, engineers say these revolutionary improvements should easily double tractor life and make big cuts in the cost of farming.

Then look at the new low price. A four-plow tractor, 20-35 h. p., at a three-plow price. Think what that wonderful reserve power means! And it costs little, if any, more than inadequate power. Every farmer should be familiar with this tractor, the greatest farm power value ever offered.

ALLIS-CHALMERS MANUFACTURING CO., *Tractor Division*
Branch: FARGO, N. D. Milwaukee, Wisconsin *Branch:* WICHITA, KANS.
Distributors: B. D. Reed Machy. Co., Pittsburgh, Pa. Banting Mfg. Co., Toledo, O.

Look Here!

Four great cleaning devices, usually found on fine autos, now used together on a tractor for the first time.



1. Oil Purolator. Cleans and purifies all the oil—45 gal. per hour. Absolutely removes all grit, even though finer than wheat flour. *No grit here.*
2. All moving parts completely enclosed in dust-proof, metal cases. *No grit here.*
3. Gasoline cleaned and filtered by A. C. Filter. *No grit here.*
4. Air for carburetor thoroughly precleaned. *No grit here.*

Result:

No grinding grit can stay in contact with a moving part of any kind. SEND NOW for pictures and full details of these amazing improvements.

WYNN CONCRETE MIXER

does heap much work—very cheap. Parts if desired.

THE BARREL MIXER CO.
1716 Division St., MADISON, WIS.

Thousands Know It for Its Good Work

Thirty-five years ago farmers bought the John Deere Model B Disk Harrow because they recognized the advantages of its remarkable flexibility, great strength, correct design, light draft and ease of operation.

JOHN DEERE

MODEL B DISK HARROW

has for nearly a half century of outstanding performance continued to strengthen its position as a leader in the disk-harrow field.

Farmers like the independent action of the gangs—the way one gang holds to its work when the other gang meets an obstruction.

They find in the pivoted-yoke construction the most effective means of getting uniform disking in irregular ground. They like the way the handy third lever and powerful pressure spring controlling the pivoted yoke enable them to apply more or less pressure for proper penetration in any kind of soil.

Write today for folder describing the Model B. Address John Deere, Moline, Illinois, and ask for Folder BS-714.

JOHN DEERE

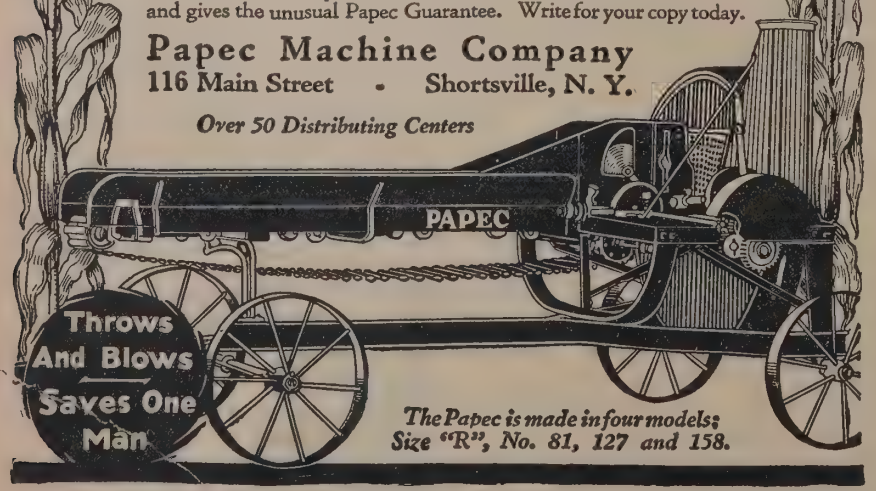
THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

PAPEC

"The Cutter That Does Not Clog"

Good Silage Saves Grain

Good silage cuts your feed bills and increases the milk flow. It's easy to fill your own silo when the corn is at its best. Just put a Papec on the job. You can operate it with less help because no man is needed at the feed table. Light draft and low speed fit it for use with any light tractor—Fordson, McCormick-Deering, John Deere, Cletrac, etc.



A Papec runs year after year without breakdowns and practically without repairs. It fills the highest silo without clogging.

Our FREE 1927 Catalog tells how to make a Papec pay for itself in two seasons. Explains how the wonderful Third Roll saves a man and gives the unusual Papec Guarantee. Write for your copy today.

Papec Machine Company

116 Main Street • Shortsville, N. Y.

Over 50 Distributing Centers

The Papec is made in four models; Size "R", No. 81, 127 and 158.

Sell Your Surplus Cows, Poultry and Other Live Stock with an Ad on Our Special Opportunities Page

Seasonable Live Stock Notes

WITHIN a month horses will be called on to earn their oats by the sweat of their shoulders. They will be called on for power and lots of it. How well they stand up under the work load put upon them depends on a number of things, some of which their owners are mainly responsible for, as, for example, starting them off in good condition, gradually hardening them for the heavier tasks, getting the harness in good condition so there will be less of bruised shoulders, chafed sides, and gaskin muscles, and such like. Are your horses and harness ready?

Horse Breaking Time

Horse breaking time is here. The well grown, green, three-year-old colt can no longer board for nothing. He must earn his keep. The wise horseman has already given him a chance to learn the feel of his working equipment. He has first given him the feel of the halter and made him accustomed to his stall; next he has put a bridle on his head and a bit in his mouth; and then, very carefully, he has put a harness on his body. All these things should always be done before connecting the power with the load. They should be done now.

Feed Dairy Heifers Enough

At this time of year when a possible feed shortage is indicated, there is a great temptation to slight the feed for growing heifers. This is a mistake. It must be paid for later when these poorly developed heifers are called upon to produce milk and at the same time continue their growth. The greatest and cheapest growth is made on dairy heifers when the growth stimulus is greatest and when there is no competition for feed nutrients like that which comes as in milk production.

Mark Calves Now

Before the spring work demands so much time it is advisable to mark the calves that are to be retained for breeding purposes. This applies especially to pure-bred calves but should also be done with grades that a record may be kept of their ancestry. Calves that go on pasture during the early summer are not easily recognized at one year of age.

Teaching Cows Their Places

A subscriber has asked about the best way to get cows to take their proper stalls when entering the barn. He is having trouble. It takes too much of his time each day to direct the cows where they belong. Aside from patience, kindness, and feed we could not suggest a "best way" to do this. Perhaps some of our subscribers can help us out.

Normal Decline in Production

A number of our subscribers have indicated that they are having difficulty in holding their cows up to the amount of milk they think ought to be produced. While a number of factors may be responsible for this it is well perhaps to compare their production with what is considered normal for each month in the lactation period. Eckles of the Minnesota Station gives us the figures on this: The decline is in about the following amounts figured as percentage, and beginning with the first month: 99.6 100, 92, 86, 82, 75, 71, 69, 64, 52, 34, 11.5. This means that a cow in her fifth month of the lactation will give 82 per cent as much milk as she gave in her first or second months.

when the mail carrier leaves them at the door. They put them where they fill up on fine sand or other material that should not be eaten by baby chicks, at least not for their first feeding. Then again they have overlooked putting in guards at the proper places in the brooder house and the result is a big loss from smothering or chilling.

St. Louis Reorganizing

Plans for the more complete organization of the St. Louis Pure Milk Producers' Association, East St. Louis, Ill., are being laid before the membership of the association. It is proposed that the chief activity of the organization shall be to bargain with the milk distributors as to prices to be paid the producer members. In addition to bargaining, the association will undertake to check weights and tests made by the dealers purchasing milk from members. It will also undertake to increase the demand for dairy products by promoting advertising campaigns, and in other ways stimulating demand.

The organization is to be a nonstock, nonprofit membership association. Milk producers must pay a membership fee of $2 and execute a note for use as collateral for loans, on the basis of $1 for each cow, with a minimum face value of $15. The association will be sales agent for its members, with authority to sell all dairy products. The marketing contract is a continuous one with option of withdrawing at stated times. The association will be largely financed out of prospective earnings. It is intended that reserves shall be accumulated for meeting future emergencies.

Payments for milk will be made by distributors directly to producers, such commissions and deductions as are required by the association being made by the distributors and paid to the association.

The association will be managed by fifteen directors representing producing districts. An executive committee of five, working through the manager, will be directly responsible for the operation of the organization.—Agricultural Co-operation.

The Calves Made Good

HOARD'S DAIRYMAN:—The following testimonial by Blaine Ferguson, county agent at Conrad, Mont., is a straw in the wind to indicate how calves distributed by the Tillamook County (Oregon) Cow Testing Association are "pailing out:" "The Tillamook calves that we received in the spring of 1923 have completed 11 months' milk flow in a cow testing association and have averaged 425 pounds fat each with first calf under ordinary farm management. These heifers are valued by their owners at over $200 each, and I doubt very much if they could be bought for that."

At $12 each f. o. b., the Tillamook Association successfully ships Jersey, Guernsey, and Holstein calves at two weeks of age into nearly all of the western states, and association members annually pocket $4,000 to $6,000 for surplus heifers that formerly were never raised. W. D. Pine, Tillamook county agent, devised the plan which includes a guarantee that the calf is sired by a pure-bred bull, is out of a 300-pound cow or better, and comes from a tuberculin tested herd. Oregon. G. N. ANGELL.

Jersey Bulls to Texas

The development of dairy farming in Hale County, Texas, made a big advance recently with the importation of sixteen registered Jersey bulls from Ohio to be used in the formation of three additional bull circles in the county. This is the largest importation of Jersey bulls ever brought into Texas in one shipment.

County Agent Huey, assisted by representatives of the American Jersey Cattle Club and the Ohio Jersey Cattle Club, selected only bulls of good breeding, with good type and from good record dams.

Under the bull circle plan, four or five men purchase bulls signing an agreement that they will each keep one bull for two years and then exchange. This provides each with the services of a first class sire for a total of eight or ten years at the cost of a single bull, and should prove the means of noticeable herd improvement.

"Hey, waiter, where's my honey?"
"Sorry, sir, but she doesn't work here any more."

The Two Standards of Perfection

Get the BEST in Silos!

If you want a wood silo—the INDIANA is recognized as the best wood silo ever made. If your farm layout calls for a tile silo—get the HOOSIER, the leader in its field. Both of these silos are now built and sold by the same company. An INDIANA or a HOOSIER will give you years of wonderful, money-making service. See our nearest dealer or write us for prices telling size silo interested in. Special discount for early orders. Fine territory open for salesmen. Address DEPT. K5, Albany, Indiana.

SUPERIOR

...the Name to Trust!

BUY with confidence any farm implement that bears the name SUPERIOR. It is a trade symbol worthy of your highest trust. It is your guaranty not only of remarkably long service but of exceptionally profitable service.

SUPERIOR implements not only save time, reduce labor and eliminate the need for early replacement—*most emphatically, they do better work!* We have built quality implements only—for more than a half-century. Our products are famous for outstanding efficiency in every grain-growing section of the world. The line is complete. There is a SUPERIOR seeding-machine for every planting need. And every model built is a precision tool—correctly designed and perfectly constructed for utmost planting accuracy.

Plan NOW—for Better Planting

See your SUPERIOR dealer now—or write direct to us—if you are in need of a drill or planter for any purpose. Grain, Corn, Cotton, Beets, Beans, Clover, Alfalfa—all crops are given the right start with SUPERIOR.

SUPERIOR seeding is safe seeding because the seeds are planted evenly and accurately—uniformly buried under an even covering of soil. No clogging. No skips. No misses. Perfect timing—even spacing—mechanical precision in every detail of the work. Dependable performance—and long years of heavy-duty service. You get both—in fullest measure—when you insist on genuine SUPERIOR Planting Machines.

The coupon below will bring you full information on any implement in the complete SUPERIOR line, which includes the famous SUPERIOR Black-Hawk Manure Spreader and the SUPERIOR Buckeye Cultivator. Even if you are not in the market for an implement of any kind, write us for advice and information regarding any special planting problems you may have.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

For practical purposes average milk may be figured at 8.6 pounds per gallon and average cream at 8.4 pounds per gallon.

News From Washington, D. C.

[Special to Hoard's Dairyman.]

WASHINGTON, D. C., FEB. 10—The Lenroot—Taber Milk & Cream Import Bill has been passed by Congress and it is expected the President will sign it.

Notices have been issued for the annual "Dairy Pilgrimage" to be held the week of April 18. Representatives are invited from all dairy organizations, and any and all individuals interested will be made welcome. The affair is under the auspices of the American Dairy Federation.

Two boys or girls, chosen for excellence of work in the boys' and girls' club work—the 4-H clubs—from each state, together with the state leaders, and a few others invited as special guests, will join in a week's visit to Washington the week of June 16—23.

Clarence W. Kitchen has been named as Assistant Chief of the Bureau of Agricultural Economics. Lloyd S. Tenney, former assistant chief, was promoted to the position of chief of the bureau some weeks ago.

Inspection of all cattle exhibited in the shows at the fairs and expositions by veterinarians of the B. A. I. service has been attacked recently, and is strongly defended in a Department of Agriculture news bulletin just issued. Repeated instances are cited of spreading infection from various communicable diseases, due to the close contact in the show ring of diseased cattle uninspected, with healthy cattle which have been inspected. These conditions, the publication states, are "exceptional" but indicate the possible danger. The B. A. I. will continue to exercise close inspection of interstate shipments and urges authorities of local fairs and shows to take adequate precautions where B. A. I. service is not required.

Dairy and poultry products—still considered together in spite of requests and efforts to get them separated—hold the highest place in the price index table for January, compared with all other groups of farm products. They are not as high as some manufactured products, in spite of this relatively favorable showing. The index of dairy and poultry products for January, 1927, is given as 152. Fruits and vegetables are at 140 and meat animals at the same point; fruits and vegetables coming up, and meat stationary. Grains are at 120, cottonseed and cotton at 85, and the miscellany included as "unclassified" at 87. This indicates that it is a good, profitable time to moderately increase butter production at a profit so far as feedstuffs are concerned.

Grinding Hay for Stock

During recent years there has been much discussion as to whether it pays to chop or grind hay and other dry roughage for the various classes of live stock.

Two trials were carried on by the Wisconsin Experiment Station last winter to study the effect of chopping or grinding good quality, Wisconsin grown alfalfa hay for dairy cows. Each trial was carried on by the reversal method to eliminate the effect of individuality of the cows so far as possible. Five cows, fed for 3 periods of 42 days each, were used to compare rather coarsely chopped alfalfa hay with uncut hay; and in other trials, 4 cows, fed for 3 periods of 35 days each, were studied to compare finely chopped hay with uncut hay.

The experiments will be repeated before definite conclusions are drawn. Averaging together the results of these two tests, there was no advantage in favor of thus preparing good alfalfa hay for dairy cows. The results from the finely cut hay appeared to be slightly more favorable than from the coarser preparation, though the difference was not marked.

It is quite probable that with poorer quality hay there could have been more advantage in chopping it, as cows usually refuse to eat poor hay up clean. In these trials the cows ate the uncut alfalfa with practically no waste.

For Beef Cows

An experiment was conducted during the past winter to study the effect of chopping alfalfa hay for beef cows and nursing calves. Two lots of cows were fed by the reversal method in two periods of 63 days each. Each lot received the same amount of hay and corn silage, but the lot receiving chopped hay was fed 10 per cent less concentrates, to find whether chopping the hay would make possible this saving of concentrates. On an average the cows in both lots were fed 30.0 lbs. corn silage and 8.4 lbs. hay. On uncut hay they received 6.0 lbs. concentrates (corn, oats, and bran) a head daily, and 5.4 lbs. of chopped hay.

The results were slightly in favor of the chopped hay ration, the cows gaining 0.17 lb. per head daily on the uncut hay and 0.38 lb. on the chopped hay. There was practically no difference in the gains of the calves on the two rations. In this one experiment, therefore, chopping the hay apparently permitted a saving of 10 per cent of the concentrates.

Chopping Soy Bean Hay

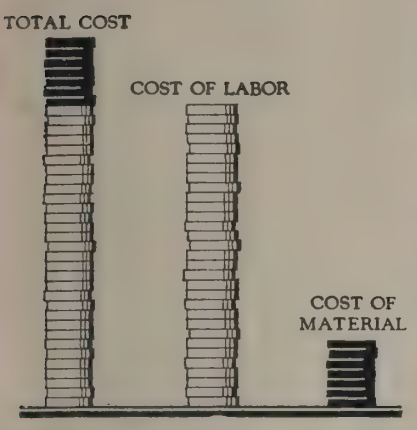
In the experiments carried on during the past four years it was found that when fed uncut soy bean hay with the usual supply of corn silage and concentrates, the cows would often eat the coarser stems of the soy bean plants, refusing on the average 7.6 per cent of the hay. Experiments were therefore carried on during the past two years to see whether it would pay to chop the soy bean hay so as to induce the cows to consume all of it.

In these trials the cows were fed all the uncut hay they would eat without undue waste. They received on the average 11.8 lbs. uncut soy bean hay per head daily, and actually consumed 9.7 lbs. On chopped soy bean hay 10.1 lbs. were fed daily, which was eaten with practically no waste. The amounts of concentrates and silage in the two rations were the same. In the first trial the yield of milk and fat was slightly greater on the chopped hay, but there was practically no difference in the second trial. In both trials the cows maintained their weights a trifle better on the uncut hay. Taking all factors into consideration in these trials, chopping the hay so the cows would eat all of it increased its value 23 per cent, taking the price of the uncut soy bean hay at $15 a ton.—F. B. Morrison, Wisconsin College of Agriculture.

A Jewish immigrant had to fill up the usual form. The first question was: "Born?" There was a space for the name of the place. He filled it up with the one word "Yes."

Wins Trip to Guernsey

ARVILLA BOESE WITH ONE OF HER PRIZE WINNERS



ARVILLA I. Boese, 18-year-old Wisconsin calf club member, was declared the winner in a national contest open to Guernsey calf club members of every state, and has just been awarded a trip to the Island of Guernsey. She will be a guest of the American Guernsey Cattle Club on the coming pilgrimage to the home of the Guernsey breed conducted in honor of the fiftieth anniversary of the Club's organization.

Arvilla has been for the past three years an outstanding member of the Guernseyway Calf Club under the leadership of J. C. Ralston, secretary of the Jefferson County Guernsey Breeders' Association. Her father, Will R. Boese, is president of that association. Arvilla is a Hoard's Dairyman Junior, and has been secretary-treasurer of the county Guernsey calf club for two years.

Her achievements include: winnings in the show ring at the Fort Atkinson Calf Club Round-up, the county fair, state fair, and National Dairy Show; trips to the 4-H club short course at Madison, the National Club Congress at Chicago, and the state fair; prizes in dairy cattle and live stock judging; and prizes in showmanship. Her record books have been of particular excellence. She has twice been selected as an honor calf club member in the state of Wisconsin.

Arvilla sails with the pilgrimage from New York City May 14 on the Tuscania for a six weeks' trip, visiting points of interest in England, Jersey, Alderney, Sark, and Guernsey. She is a very enthusiastic club member and plans to become a 4-H club leader.

What is the COST of painting with Eagle?

THE cost of painting is determined by the cost of materials, plus the cost of labor.

In the big cities a paint job is 70% labor cost and only 30% material cost. In rural communities labor costs are a little lower but labor everywhere is so high that you can not afford anything but the highest quality of paint materials. It requires less labor to apply high quality paint because it covers well; it brushes out easily and can be spread over a greater area, thus reducing the cost per square foot.

The principal reason for the economy of Eagle Pure White Lead is its long wearing quality—made possible by the tough elastic strength of pure lead in oil—a strength which no other material seems to possess so completely.

And Eagle is inexpensive in first cost. One hundred pounds makes approximately seven gallons of pure lead paint.

Ask any good painter his opinion of Eagle Pure White Lead—in use since 1843. *The Eagle-Picher Lead Company, 134 North La Salle Street, Chicago, Illinois.*

Have you your free copy of the Eagle "Tinting and Mixing Chart"? It contains many helpful suggestions for farm painting.

New Live Stock Secretary

ARLIE MUCKS

Arlie Mucks, county agent in Barron County, Wisconsin, has recently been appointed secretary of the Wisconsin Live Stock Breeders' Association. This position has been creditably filled for the past five years by Reid Murray who has resigned to take up other work.

Mr. Mucks was a star athlete at the University of Wisconsin a dozen years ago. He held the world's record in the discus throw, was a shot putter of note, and a member of the U. S. Olympic team that invaded Stockholm, Sweden, in 1912. He played football and was mentioned by some critics for All-American honors.

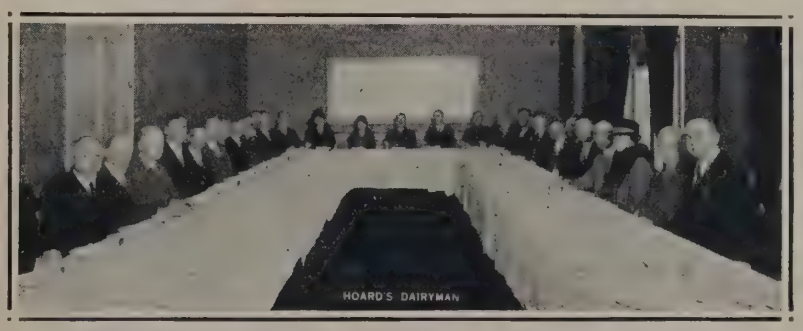
Dairy Sire's Daughters Best Index of His Value

A great dairy sire is one whose daughters have a high average yield of milk and butterfat, a high average increase in milk and butterfat yield over that of their dams, and a high percentage of their number better than their dams, says R. R. Graves of the Bureau of Dairying, United States Department of Agriculture.

In a study of 23 Holstein-Friesian sires, each having six or more tested daughters from tested dams, some conclusions were arrived at concerning the hereditary transmission of production, says Mr. Graves. Some of the sires in the list raised both the milk yield and the percentage of butterfat of their daughters as compared to the production of their dams. Some raised one and lowered the other. Some lowered both. But no one sire raised both the milk and butterfat percentage of all his daughters, nor did any one sire lower these records of all his daughters.

The ability of a sire to raise or lower the yield of his daughters does not necessarily have a correlation with the record of his own dam. Rather, the prepotency of a sire seems to depend upon the combination of factors governing the yield of milk and percentage of butterfat that he has inherited from his parents. If he has inherited only factors that will determine high milk yield and high percentage of butterfat, he will be prepotent in impressing these characters on his offspring. If he and the dams with which he is mated have inherited from their parents a mixture of the factors for both low and high production, which is often the case, a variety of combinations in the different offspring will follow, and they will be of varying degrees of producing ability.

The fact that the percentage of butterfat and the milk yield are inherited independently, at least within limits, and that both the sire and the dam contribute to the inheritance of their daughters, governing both milk yield and percentage of butterfat, indicates that improvement in yield of butterfat can be brought about by selection for both milk yield and percentage of butterfat.



The big problem seems to be to locate the sire that has inherited only the factors determining a high producing capacity. The degree to which he has inherited these factors can be determined only by testing a large number of his daughters and comparing their records with those of their dams.

The increasing number of records of daughters and their dams becoming available through the cow testing associations furnishes a means of calculating the comparative worth of a greater number of sires than has been possible in the past. The 23 sires in this study were given comparative rankings in a new method devised by Mr. Graves.

For instance, sire E ranked first in average milk yield of daughters, third in average butterfat yield, fifth in average increase of milk, fifth in average increase of butterfat, first in percentage of daughters making increase in milk, and first in percentage of daughters making increase in butterfat. The sum of these rankings is 16, which, being the smallest ranking number, places him at the head of the list.

On the other hand, sire V, at the bottom of the list of sires, ranked nineteenth, twentieth, twenty-third, twenty-second, seventeenth, and sixteenth respectively in these same classes, giving him a total ranking of 117, or more than any other sire in the list.

The complete discussion of this study has been published in Department Bulletin 1372, recently issued. A copy may be obtained, while the supply lasts, by writing to the United States Department of Agriculture, Washington, D. C.

ELEVENTH ANNUAL CONVENTION OF THE OREGON GUERNSEY BREEDERS' ASSOCIATION

E. J. Mahy, president for past year, at center in back; to his right, Mrs. J. W. Mulloy, past secretary; second to his left, C. T. Gilbert, president for the coming year.

Parchment Gaskets

Save Money

Place a Parchment Gasket over the top of every can of milk or cream you send to the creamery or shipping station and save the cream that is lost when the cans are rolled in handling or jounced around on the truck.

No Trouble

Parchment Gaskets are easy to use. They come cut the correct size (11″ x 11″), and need only to be soaked in fresh, clean water; placed over the top of the can and the metal cover jammed down same as usual.

Booklet and Samples Free

Let us send you free samples of our Parchment Milk Can Gaskets and booklet, "Making Milk Shipments Pay," which tells many other interesting things that Parchment Gaskets will do for you.

Do not send any money; just ask for free samples of Parchment Milk Can Gaskets. **Be sure to write your name and address clearly.**

Paterson Parchment Milk Can Gaskets are tougher wet than dry and save many times their cost for the man who uses them.

10 Day Test

Write today for descriptive literature and particulars of how Dr. Clark's PURITY Milk Strainers help you get Grade "A" test and more money for your milk.

It is the only Strainer made that's guaranteed to strain 100% clean. Our 10 Day Trial Test enables you to prove it at our risk—your money back if it fails to remove ALL the dirt. Thousands in use — two sizes 10 qt. and 18 qt. Sold by dealers everywhere. (6)

PURITY STAMPING COMPANY
Dept. Q5 Battle Creek, Michigan

DR. CLARK'S **Purity** MILK STRAINER

Thousands of farmers tell how good fences pay for themselves by the waste they save

1 Taber, Springville, Ia., in a fenced field had 70 bushels of corn per acre, hogged it down and got $1 per bushel. In an unfenced field had only 50 bushels per acre and sold it for 50 cents per bushel. Good fence made him $45 per acre extra profit.

2 Lauby, Savageton, Wyo., saves $1500 a year in herding expenses with 13 miles of woven wire fencing on his sheep ranch.

3 Laird, Mason City, Iowa, makes $6 more per acre rent on a stock-share basis with good fence.

4 Hiner, Reed Point, Mich., paid for stock tight fence in 2 years by saving herders' wages.

5 Oathout, Ethan, S. D., says well fenced farms sell for at least 25% more than the same farms poorly fenced.

6 Schultz, Russell, N. D., made worn out land bring 28 bushels of wheat per acre and turned off $2,600 worth of mutton, wool and hogs in one year with $800 worth of fencing.

7 Kennedy, Hunter, Okla., says: "Gleanings from 100 acres of stubble will produce 1000 pounds of pork."

8 Taylor, Eaton, Tenn., turned pigs into a fenced-in wood lot and made them outweigh his neighbor's pigs 90 pounds each at killing time. Good fencing paid for his farm.

9 Luscombe, Fairmont, Minn., hogged down and saved $420 worth of blown down corn last year in a hog-tight field.

10 Pinkney, Fairmont, N. D., cut his corn feed from 11 to 8½ bushels per 100 pounds of pork with hog-tight fence.

11 Simpson, Eden, Texas, with good fence, made $3,100 in one year on sheep and goats.

12 Wyrock, Lewistown, Mont., summer fallows grain fields every third year and makes more than $1000 net returns on tight fence.

13 Richards, Fairbank, Ia., with tight fence, made $40 per acre extra profit on hogs and lambs.

WE have thousands of letters on file from good farmers telling how they hog down corn, save fallen grain, green feed and missed corn, rotate crops, etc. and make extra profits with hog-tight fence.

"Red Strand Galvannealed" is the good old "Square Deal" except better, longer lasting now than ever before. Full length picket-like stays hold it straight; wavy strands keep it firm; can't-slip knots keep it trim; full gauge, honest weight—but "Galvannealed" now—not galvanized. Extra heavy zinc coating and more copper in the wire keep rust out and give longer life at lower cost.

Let us send you FREE

Five booklets—(1) Cost of Fencing Farms; (2) Making More Money from Hogs; (3) What 17,000 Farm Folks Said; (4) How to Test Fence Wire; (5) Keystone Catalog. All interesting, instructive, profitable. Ask your dealer for them, or write us.

Practical Cream Grading

F. E. CHARLES, KANSAS

WHERE there is a will there is a way—and with Walter Daly, county agent in Lincoln County, Kansas, the adage apparently works.

In his Western Kansas county, where dairying is in its infancy and the average person doubtless thinks of farming in terms of so many bushels of wheat to the acre, Daly has been doing something that should set dairymen in other sections to thinking. He has organized the cream buyers and producers so that cream is bought and sold on a graded basis and a five-cent differential paid between first and second grade cream.

For years, dairy extension men, dairy commissioners, and creamery men have been trying to do just this thing. They have attempted to set up a workable plan for buying butterfat on a basis which pays a premium for the first grade product and thereby rewards the careful, sanitary dairyman. But they have had little luck in getting local buyers lined up on a set of rules and standards for grading. It has been easy to set up the standards but to make the buyers use them uniformly and pay the premiums has been a horse of another color.

"In our campaign we found a great deal of difficulty due to the fact that all buyers have been after the volume of cream without any regard to its quality," Daly stated in telling about his efforts. "This has resulted in a bad competitive condition which is responsible for bad methods of cream buying."

Daly set out to see that cream in his county was purchased on a graded basis. He arranged last February a joint meeting and banquet of the county farm bureau and the local chamber of commerce, at which F. D. Farrell, president of the Kansas State Agricultural college, was the principal speaker.

An all-day meeting was held, attended by one or more representatives of each creamery. Everything they had hoped for was not accomplished at that meeting. There was no agreement on a price differential between first and second grade cream. But all buyers agreed to grade in Lincoln County and to tag every can of cream that came in designating it as first or second in quality.

The tagging was to continue for one month. When a farmer brought in a can of cream it was graded and given either a blue or a red tag. The blue was to denote first grade; the red, second grade. On the blue tags were printed these words: "First Grade Cream; You are helping to raise the standard of Lincoln County cream which will mean a higher price for butterfat. The Sweeter and Cleaner it is, the Better it is; Lincoln County Farm Bureau."

The red tag, denoting inferior cream, admonished the owner to produce first grade cream by: 1. Keeping all utensils clean. (Thoroughly clean separator immediately after using.) 2. Cooling at once and keeping cool—by placing in cold water and stirring. (Do not mix warm cream with cool cream.) 3. Marketing at least twice a week. (Oftener is better.) 4. Skimming cream to test about 40 per cent.

A little later in the spring, with the help of other local boosters, Daly got the producers, local buyers, fieldmen, and creamery companies whipped into line at one and the same time. All along he had explained to farmers the advantage to them of grading cream—it meant better prices—a reward for a quality product. He talked local buyers—explained that the obstacle in grading was simply getting started. He convinced creamery fieldmen of this, and finarranged meetings in Kansas and Omaha with the managers creamery companies buying in county. The heads of the compaimmediately agreed to pay a five-differential and all local operawere instructed to grade and pay differential.

The five-cent difference is made paying a two-cent premium for grade cream and docking the sec grade cream three cents per po for butterfat.

Some of the operators were opp to the differential plan but sinc was put into effect they are pay the premium and making the th cent dockage. Clipping three c off each pound of butterfat brou in by a customer is a good way to patronage and buyers have a tende to grade cream as first grade w some of it should really be sec grade. But the loss by such prac must ultimately be absorbed by company, so the economic angle finally force operators to grade 2 cream as No. 2 and they in t will force the farmers to market t cream in such condition that it rank first grade.

The admirable feature of the Daly has put across in his coun it is the more remarkable bec farmers dairy only as a side lin their wheat farming—is that the cream earns for the producer a cent premium on every pound of while second grade cream actu draws a dockage of three cents b normal market price. The plan wards the conscientious dairy who produces clean, pure, whole cream and actually fines the car ones who for years have retarded production of better butter and c milk products.

He Was Married, Too

Butcher: "I've worked under same boss for 20 years."

Butter and Egg Man: "I can that—it's my silver wedding week!"—The Progressive Grocer.

Dairy cows are relatively i fleshed and do not withstand o weather like beef cows. It is econ to keep them from becoming o and not to turn them out in w except for such time during the m dle of the day as they appear t joy being out.—G. C. HUMPHREY

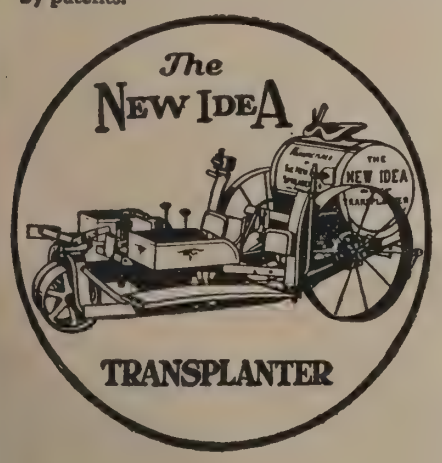
NEW IDEA



INVENTIONS—
NOT IMITATIONS

HUSKER AND
SHREDDER

Better Husking—Better Shredding!
The NEW IDEA Husker and Shredder husks clean—Very little shelling—Easy feeding. Big capacity. All metal. Hardened Steel Gears running in enclosed dust-proof oil cases. Can be operated at good capacity by small tractor. It's a NEW IDEA—the sensation in the Shredder field. Fully covered by patents.

TRANSPLANTER

QUICKER, SURER PLANTING—
Better Crops—Bigger Profits!
NEW IDEA Transplanter pays for itself on 3 acres of transplantable plants set 6 inches or further apart on level land or ridges, thru lower labor costs, minimum loss of plants, and increased crop. Full line of attachments including potato planting and wire check. It is a NEW IDEA—fully covered by patents.

The 23-acre factory back of NEW IDEA Farm Equipment. The largest independent spreader factory in the world—not in any trust or combination. 4000 agencies. More than 60 factory branches and transfer points for parts and service.

The *Safety* Value of Leadership

You naturally prefer an ***original*** article to the best imitation that can be made. Imitation is so frequently blind—it follows without equalling. Twenty-eight years ago NEW IDEA showed the way with the ***first*** successful wide-spread spreader—an ***invention,*** not an ***imitation.*** And step by step, NEW IDEA continues to lead the field with its constant policy of inventive development and improvement.

Today the value to you of NEW IDEA leadership is greater than ever. It means that when you purchase a NEW IDEA machine from a dealer, you know he is giving you the utmost in reliability and performance; the best yet produced in efficiency, in durability and in ease of handling. Any NEW IDEA machine is a ***safe*** machine for you to buy.

Be sure to look over a NEW IDEA catalog before you buy and you will insist on getting the ***genuine***—not merely a machine that ***looks*** like it or is ***said*** to be as good.

MODEL 8 NEW IDEA, with many improvements covered by patents, represents the most advanced mechanical construction ever seen on a spreader. The use of high-strength structural automobile steel and modern rust— and acid-resisting materials is a distinct contribution to long wear and light draft. Send the coupon for complete information.

Here's the magneto that has made a good engine better

The fact that more than a half-million "Z" Engines are in use is sufficient proof of the satisfactory service they are rendering. But now—equipped with a Rotary High Tension Magneto of our own make that assures a hot, fat spark and makes easy starting a reality—the reliable "Z" Engine is *more dependable than ever.*

The "Z" Engine is the only engine of its type that is equipped with a High Tension Rotary Magneto. This magneto is self-oiling—is dust-proof and water-proof. It is built and fully guaranteed by Fairbanks-Morse—*one responsibility behind both engine and ignition.*

Get this dependable ignition on your next engine

Under ordinary conditions, the rotary high tension type of magneto is too costly to use on a small engine. Only through volume production and *making our own* magneto are we able to equip the "Z" Engine with this magneto *at no increase in price.*

For several years this new magneto has been proved in use on "Z" Engines. More than 65,000 owners have revised their ideas of how easily an engine can be started and how smoothly it can run. The new magneto is the reason—and you can have it only on the "Z" Engine! Coupon below brings information.

FAIRBANKS, MORSE & CO., *Manufacturers*
Chicago, U. S. A.

Quality throughout

"Z" Engine quality is universally recognized. So is their long life and dependability. There are fewer parts subject to wear in the "Z" Engine and those parts are carefully made—are drop forged and specially heat treated just as such parts are made in the largest and finest engines. Yet the prices are exceptionally low because large production has cut manufacturing costs to a minimum.

PRICES

2 hp. battery equipt.... $48.50
2 hp. magneto equipt... 58.50
3 hp. magneto equipt... 101.00
6 hp. magneto equipt... 153.00

Cash f. o. b. factory. Add freight to your town.

COW TESTING IN IRELAND

J. R. MOLLOY, IRELAND

ABOUT eighteen years have elapsed since the first cow testing association was established in Ireland. There are about 200 associations with 50,000 cows under test, an increase of 5,000 over the previous year. An association can be formed wherever there are 200 dairy cows within easy reach of each other for the purpose of supervision. Where it is not possible to get so many cows within a convenient distance, an association of 150 cows may be recognized.

These cow testing associations, as might be expected, are in the more progressive districts. The average milk production for cows under test is about 4,500 lbs. per annum. For cows not under test the average yield is probably not over 3,500 lbs. Irish herds are chiefly of Shorthorn type. There are cows giving from 10,000 to 12,000 lbs. and showing an average yield of 6,000 lbs., but a lot of grading up will have to be done before this becomes general.

When it is mentioned that there are 1,350,000 milch cows in the Irish Free State and that only 50,000 of these are under test for milk yield, it will be seen that, despite undoubted progress, a great deal of leeway has to be made up. In order to speed up the work in this direction, the Department of Lands and Agriculture arranged a term of lectures for cow testing supervisors at University College, Cork. The last of these was attended by 150 supervisors who listened to lectures on various aspects of their work by well known authorities.

In 1925 County Cork led with 70 associations and 16,777 cows under test, not a bad number, but only nine per cent of the cows in the country. An example of the value of cow testing is afforded by one farmer in Clonakilty who doubled the milk yield of his herd in six years. In 1919 he had six cows yielding an average of 5,330 lbs. This he increased by 1,000 lbs. each year until 1925, when from five cows he obtained an average of 11,080 lbs. milk with 397 lbs. butterfat.

Tipperary had 26 associations with 6,054 cows under test, while Limerick had 19 associations with 5,288 cows under test. Limerick now has 32 milk testing associations, and the County Committee of Agriculture has set an example by raising the qualifications of premium dairy bulls to 8,000 lbs. on both sides of their pedigree, thus doing much to improve the milking record of that county. Kerry, with 12 associations, had 3,460 cows under test in 1925, while Waterford with 13 had 2,761 cows und test.

We are now approaching the tir when dairy cows will be sold more their performances than on appea ances. Milking tests have clear shown that appearances are dece tive, and when dairy cows are bei sold their records are now frequent asked for.

To form a cow testing associati it is necessary to secure an entry not less than 200 milch cows. App cation for recognition must be ma to the Department of Agriculture b fore February 1, but the Departme of Agriculture reserves the right sanction associations of smaller si for special reasons. Each memb must pay an entry fee of 75 cer per cow for each cow in his herd, a such further contributions in propo tion to the number of his cows may be necessary to defray the e penses of the association.

Provided that the requirements the scheme are complied with, t Department of Agriculture, for ea of the first two years' work, w grant one dollar for each cow on t throughout the year while on mi Afterwards it will continue to co tribute, for a limited number years, a grant which will be subje to a gradual reduction each ye Each member must contribute n less than 75 cents per cow enter for test, and the association mu provide itself with the apparat necessary to carry on the work. some cases county committees of a riculture make grants toward t purchase of apparatus, but outsi this the association is liable for l expenses including the payment of supervisor to check the records a take samples. Each member of association must undertake to wei and record every seventh d throughout the year the milk yi of every cow entered for the te In this connection each member is pected to provide himself with a liable scales.

It is urged that every cow testi association should own at least c dairy bull descended from deep mi ing dams on both sides of his pe gree. In certain cases this has ac ally been done with gratifying sults. A further object of these sociations is to have the best milk mated to such bulls and the heif calves kept to replace the poor mi ers sold off. These again are to e mated with bulls of heavy milki strains.

The affairs of each association worked by a committee of five, wh a president who also acts as tre urer.

SEVENTH ANNUAL CONVENTION OF THE WASHINGTON GUERNSEY BREEDERS' ASSOCIATION

Leland J. Clark, past president of the association, is in the far corner and Dr. H. A. Wright, recently elected president, is third to his right.

Production Records and Registration

HOARD'S DAIRYMAN:—Merit in dairy cattle depends, first, on performance at the pail; second, general form and appearance or good looks. "Handsome is that handsome does."

The basic standard, may we say requirement, for a breeder of pure-bred dairy cattle should be fixed that each milking should be weighed and properly recorded, honestly, of course. A test of butterfat of a day's milk should be made at stated intervals not less than monthly, by the dairyman himself, if competent. Each dairy breed should have a minimum standard of milk and fat production for the first or, preferably, for the first two lactation periods. The registration application should be accompanied with photographs instead of drawings of the animal. Application for the registration should be made within a year after birth as at present and kept on file for females until a record of performance is completed of the first lactation before the registration is published. The registration should be annulled for the individual that does not meet the standard minimum production. The progeny could also be unqualified for registry. This would eliminate much record keeping of pure-bred scrubs.

Sentiment with reason prevents complete eradication of human degenerates but it should not interfere with the decapitation of bovine degenerates. At least they should be placed in the grade animal class, not eligible to registry.

The Advanced Registry class might be continued by the different breeders' associations, but with individual records for each recorded female the necessity would be in a measure obviated. If C. T. A. and A. R. O. testing is to be continued, then we need O. R.-T. I. (dairyman's record test inspected) testing. The C. T. A. and A. R. O. testers might lose their jobs in their present capacity if each breeder of pure-bred dairy cattle were to keep adequate records himself and establish a D. R-T. I. class of testing. But there would be room for those testers as dairy experts and inspectors.

In the registration of dairy cattle they could first qualify and then be authorized by the different dairy breed associations to O. K. registration application within prescribed regions and score the animals, eliminating those falling under the 75% point as recently recommended for bulls in the Holstein-Friesian Association of America. A stipulated fee would be allowed them for judging, to be paid by the breeder. When an animal would be scored by the regional inspector under 75%, the dairyman could refer the case to a state authority at his expense, for the higher authority to come and do the scoring.

As dairy experts they could advise dairymen in the compounding of rations and purchasing of feeds similar to the work done now in cow testing association work. As inspectors they could serve in counties or regions as do our bank examiners within stated periods of time, say every six or perhaps three months as a minimum, at which time the daily records of the dairyman could be checked and proven by bonifide sales of milk, butter, or cream for a given period, as well as a check-up on quantity and cost of feed fed. The inspection trip could be paid by the dairyman as banks now pay for state or national inspection. In case of suspicious records the time and thoroughness of the inspection could be prolonged at the expense of the person who throws himself open to suspicion.

The dairy expert could serve in counties or regions and cover a larger constituency than is now being done by a cow tester who is limited to 30 herds. It could be done at less expense to the dairyman and withal make a larger compensation possible to the capable and energetic man.

The system presupposes the necessity of honesty on the part of the dairyman, but does not registration under the present system presume the same? Are the present A. R. records always beyond suspicion? Evidently not, if press reports can be relied upon. Daily milk records are more accurate than a day record per month is, and butterfat testing is simple enough to be learned by any one who is worthy of being called a dairyman.

We need technical advice and guidance by the expert, but it is an undue expense to the dairyman or unnecessary sacrifice to the cow tester in time or compensation to spend a full day monthly in weighing the feed and milk from 8 to 12 cows and testing the milk with a computation of feed cost and product values.

Economy, efficiency, and development on the part of the dairyman and expert would result from the suggested changes.

Pennsylvania. ENOS H. HESS.

Medium: "The spirit of your wife is here now. Do you wish to speak to her through me?"

Interviewer: "Yes, ask her where she put my winter underwear."

Wheel it in—and start milking!

Nothing to install — no pipelines — no vacuum tanks — no special pails

Clean in 1 Minute
Just Pump Water Through!
It almost cleans itself. No rubber lined teat cups to wash. No pipe lines or vacuum tanks to clean. No pulsator. No extra parts to bother with. No pails to wash—*you milk right into YOUR OWN shipping cans.* Boon to housewives. *Absolutely sanitary.*

Gas Engine, Electric or Hand Power

If the power gives out, you or your boy (yes, your 10 year old girl) can pump by *hand. A wonderful* advantage.

So simple! So very, very simple!

That's the secret of this successful milker. That's why it's *so* easy to clean; that's why the upkeep is almost nothing; that's why the cows take to it so quickly. A positive *stop* of *all* vacuum on each stroke of our simple pump; that's *the* way for teats and udder! The secret? Our simple, direct air release pump and teat cup—no pulsator, no rubber lined cup. Our catalog explains. ***Read it!***

What Dairymen Say:

Thousands of dairymen write us like this:

"The Page Milker is a Godsend. So simple—so sure and easy to use. It can be cleaned so quickly."—W. F. Wolf, Milford, Mich.

"I have used my PAGE Milker twice a day for over two years, and have milked as high as twenty-two cows. I also want to say that your company has given me the very best of service." Yours truly, Albert E. Nelson, R. F. D. No. 2, West Chicago, Ill.

"The PAGE Milker does very good work and is far ahead of hand milking. It lets us out about one hour sooner than if we were milking by hand."—Frank H. Fuller, Orvell, Ohio.

"I still like my milking machine fine. It is giving entire satisfaction. We are milking fourteen cows and have milked in thirty-five minutes. We could not begin to do it without our machine."—Fletcher Peterson, Rt. No. 2, Brownstown, Ill.

"Can milk 6 cows and strip them in 15 minutes. Cows like it better than hand milking. Easy to keep clean. My wife can use it just as good as I can."—Geo. Miller, Rt. 3, LaSalle, Ill.

$67 *down* **AFTER free trial**

Don't pay us a cent *until* you are satisfied that this milker is just right for *your own* cows—No money down—No C.O.D. to us. Just wheel it in and TRY it *thoroughly*—nothing to install. *Then* if you are satisfied:

8 months to pay

—and yet, while allowing 8 months, we give you a *rock-bottom price,* direct from the factory. Also our iron-clad 10 year guarantee—yes, 10 years.

Send for complete information on this wonderful milker and the long time payment plan today—**NOW while offer is still open.** Find out NOW even though you are not yet ready to buy. No obligation. Write for free catalog **NOW.**

YES, **Mr. Dairyman,** here it is—at last—the milking machine that *solves* the dairy problem!——Find out—investigate—get the catalog and special offer *now,* while this special offer lasts!

Here's your one chance with this wonderfully simple machine to find out on a REAL Free Trial what the milking machine will mean for you on your own cows. Why? Because you get this machine and start right in milking; there's nothing to install; nothing to build or fit into your barn; just move the PAGE in and start milking. No bother, no expense. Payment only after you've given the milker a thorough trial.

DO SEND for our monster size circular with letters from hundreds and hundreds of farmers all over U. S. A., telling what they know about Page Milkers and *what these practical farmers say about the way to use a milker! Investigate* —Mr. Dairyman. Don't miss this—write for that circular of farmer letters.

FREE Book on Milking

"The Page was always a success with me I used it 6 years." —W. R. Olson, Fairchild, Wisc.

"I milk 14 cows in 35 minutes."—Arthur Forrester, El Centro, Calif.

"I am milking 250 cows, and I use 3 of your machines. I highly recommend the Page."—G. Anderson, Lemon City, Fla.

Mr. Dairy Man: Even if you don't want to try out a milker for many months, do write *at once* for our catalog and get your name on our list for our extra special offer. It costs you nothing and no obligation. Now we WARN YOU: write now if you just *may* be interested in a trial *later.* We *do* want you to find out, to investigate—*now.* Learn about the latest discovery in machine milking, get the facts, the figures. See coupon! Don't miss this chance to *find out* the *latest* and best news on milking machines.

This offer is POSITIVELY for introductory purposes! Void the day we have a dealer, agent or salesman in your neighborhood. So, if you don't want to try a milker now, *reserve* the right for this offer (also for user agent offer right) later—no obligation. Write at once for catalog or you may be too late.

Special Farmer Agent Offer—No canvassing—just demonstrate the milker on your farm. No selling experience necessary. Other dairymen have made hundreds of extra dollars—easily—quickly.

BURTON-PAGE CO. 400 No. Michigan Ave., Dept. 9622 CHICAGO

Please send me your free booklet containing the facts on milking machines and full details of your free trial, easy payment offer on the Portable Page Milkers.

Also copy of your 10-year guarantee, and your mammoth size circular of letters from farmers telling how they use your milker on their own cows.

Would you like to be a FARMER AGENT?.....
Some farmers have made big money as agents *without* leaving the farm.

Do you also want our cream separator offer?.....

If you are going to be in the market for a separator any time within the next twelve months, state here about when?.....

The editors of many leading farm papers know the Page Milker. A leading editor said, "I advise you to investigate all good machines, including the Page offer as per coupon above."

SPEED WAGON

Sales to Dairymen Increase Over 250%

Last year the percentage of Speed Wagon sales to dairymen leaped 253% over the average for the two previous years. That means that dairymen realize the greater earning power of Speed Wagons in their work. It speaks volumes for Speed Wagon performance.

It is the same in every line of farm work. Speed Wagons have risen to pre-eminence through sheer ability and economy. Yet even more pleasing is the attractive first price which combines with low operating cost and long years of dependability to make low cost transportation such as dairymen must have.

Your Speed Wagon dealer is acquainted with your transportation problems. He has helped others solve theirs. He can help you. See him today.

Mention Hoard's Dairyman to Your Dealer—It Helps Us

Georgia to Meet Its Problems

J. H. REED, GEORGIA

THAT the business men of Georgia will co-operate with farmers wishing to change from an all-cotton to a cow-hog-hen program was indicated recently at a conference held in the offices of the Georgia Association and attended by representatives from practically all of the lines directly concerned in the equipment of farms for the production of live stock.

In opening the discussion, Secretary Abbott of the Georgia Association pointed out that the minimum expense involved in changing from cotton farming to live stock farming was $500, and that if only ten per cent of the farms in each county were thus "converted" each year, it would involve a total expense to the state of $8,000,000. On the other hand, he reported a survey of Turner County had showed that the only farmers in good shape were those who had adopted a live stock program, and that the all-cotton farmers of the county were in bad shape financially. He urged upon the business men the necessity of helping farmers to make the change from cotton to cattle.

Mr. Abbott was followed by Willard Cope, of the Georgia Utilities Information Committee. Mr. Cope stated that a survey of a certain county had revealed the fact that the average profit made by farmers for the year was only a little more than $40, and he pointed out that this profit did not allow them to buy electric power or any of the products carried by the firms represented. He stated that the only solution of the problem lay in a change from a one-crop system to a system including live stock and diversified crops and he warned the business men present that no large sales to the farmer could be expected until the change had been accomplished. He concluded his remarks with the pointed statement that it was everybody's business to help the farmer get on his feet in Georgia.

Mr. Antrim, of the Jesup and Antrim Ice Cream Company, gave some idea of the demand for milk and milk products by stating that during the past year his company had purchased $40,000 worth of butter *to be reconverted into ice cream!* The cream, he declared, could not be secured in Georgia. To have it shipped in from the North or West would involve too heavy freight charges. So he reversed the usual procedure by buying butter and reconverting the butterfat for use in making his product. He stated that his company could consume a great deal more milk if Georgia farmers would only supply it in the quantity and quality demanded by his concern for the manufacture of ice cream and other products.

J. W. Firor, of the Georgia State College of Agriculture, pointed out the necessity of raising more forage and of always having a market for the surplus milk and cream. Experience in marketing poultry, he stated, had shown the vital necessity of "clearing" the surplus stock if the industry were to grow. And the same problem was faced by dairying. Wherever a surplus of milk or cream was produced, it acted as a heavy weight upon the expansion of the industry, and he urged upon those present the vital need of perfecting a marketing organization so that all of the surplus milk in each community would be used and the demand be continually increased.

While no definite action was taken at the conference, it is probable that a survey will be made by the Georgia Association of every county and community in the state to learn the number of responsible farmers in each community wishing to make the change to dairy and live stock farming. A careful study will be made of the financial ability of each of these farmers to make the change. Then, in each community, the ability of the bankers and merchants to extend the necessary credit to these farmers will be carefully surveyed; after which it is likely that steps will be taken, either through the extension of special credit or a special live stock financing organization, to provide the funds and the credit needed by these farmers to make the change.

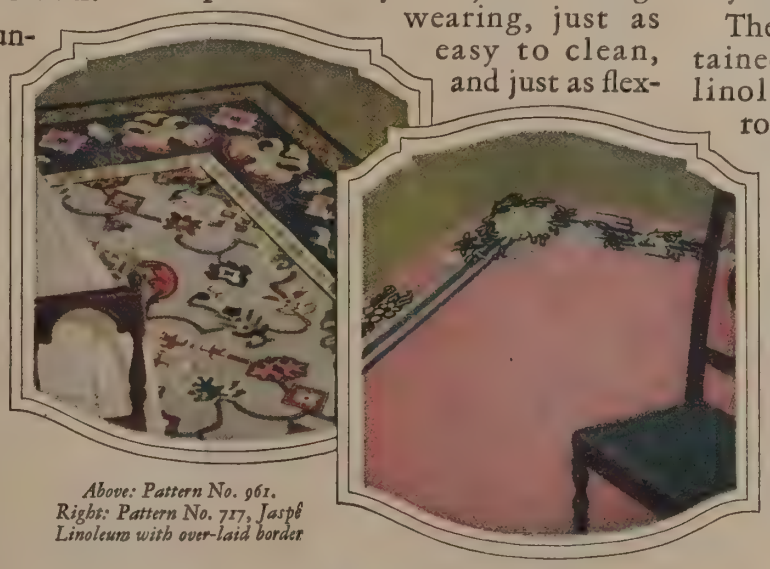
At any rate, it is certain that the problem will be attacked in a businesslike way; that the firms directly concerned in the supplies needed by dairy farmers will co-operate to a large extent, and that the farmer who is reliable and who really wants to start in the live stock business will receive every possible aid in his venture, including credit for the goods he needs, advice from the county agent and state college of agriculture, and a ready market for the milk, cream, butter, poultry, and eggs that he produces.

"What would your mother say, little boy," demanded the passerby virtuously, "if she could hear you swear like that?"

"She'd be tickled to death if she could hear me," answered the bad little boy. "She's stone deaf."

Fifty-two old time fiddlers from four states ready for action in the elimination contest for corn belt championship at the Agricultural Conference at Purdue University, January 10—15, 1927. This was one of the most popular events during the conference week.

Genuine Cork Linoleum Rugs in NEW–DIFFERENT–PRETTIER *Patterns*



On the floor: Armstrong's Jaspé Linoleum Rug with over-laid border, No. 706

"I never dreamed a smooth-surface rug could be so beautiful"

NEW BEAUTY in Armstrong's Linoleum Rugs . . . a brand new idea in rug design, something entirely different from anything you have seen before. New colors, new patterns, prettier than anything you ever dreamed of having in a smooth-surface rug of real linoleum.

No words can picture the unusual beauty of these new Armstrong Rugs. Nothing less than your own personal inspection at a floor covering store will do them justice. Ask to see the genuine Jaspé rugs with the over-laid borders, the rugs with the two-toned field, and the rugs with the unit borders. Again Armstrong has achieved a new style and vogue in rug design!

Only the patterns have been changed. Armstrong's Linoleum Rugs are still made of genuine cork linoleum from the printed surface right through to the sturdy burlap back. They are just as long-wearing, just as easy to clean, and just as flexible and easy to handle as ever. They are just as inexpensive and economical to buy as they always have been.

Above: Pattern No. 961.
Right: Pattern No. 717, Jaspé Linoleum with over-laid border

These new rug patterns can be obtained only in Armstrong's genuine linoleum rugs. Designs for every room—in all sizes up to 12 ft. by 12 ft. and 12 ft. by 15 ft. Remember to ask for Armstrong's by name. Any furniture or rug merchant can get them for you if he does not have them in stock.

"RUGS OF PRACTICAL BEAUTY"

This attractive booklet, printed in colors, illustrates the new patterns. It is free. Write for it to the Armstrong Cork Company, Linoleum Division, 1012 Jackson St., Lancaster, Pa.

If you ask *me*, P. A. is great tobacco!

I'VE DONE a lot of pipe-pioneering. There's hardly a brand or a blend that I haven't tried out at some time or other. As man to man, I want to say that there is just one tobacco that gives me the solid, deep-down enjoyment I demand of a pipe—*Prince Albert*.

When I opened my first tidy red tin and got a full breath of that rich, mellow P. A. aroma, I said to myself: "Old Son, this is *tobacco!*" The first pipe-load proved the aroma was no false prophet. I'll never forget that day. It has meant a lot to me.

I stick by Prince Albert because Prince Albert sticks by me. Its fine, full-bodied flavor is a genuine joy. I smoke it from morning to midnight and enjoy every fire-up. There's no more bite or parch in P. A. than you'd find in a honey-dew melon, and it's just as sweet.

The one regret I have about P. A. is that I didn't discover it sooner. I'm telling this to you now so that you may profit by my experience. You may think you are perfectly satisfied with your present brand. So did *I* . . . until I tried Prince Albert!

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—no other tobacco is like it!

The dependable Radiola 20
enriches every side of farm life

There's the business of farming—the interest of learning—the joy of living! And in it all, Radiola 20 takes a central place around which the days revolve.

When the weather reports are being broadcast, a single turn of a finger brings them in clearly. Whenever there's produce to sell, there's news of its market price, just for the tuning in. You can count on a Radiola 20, without tinkering or fussing or servicing. It is one of the products of a quarter century of radio pioneering; and throughout a considerable period of trial, testing and perfecting, it has proved it will stand up, and give steady, dependable performance.

It has a special "amplification" that gives it the distance reach of much bigger sets. And it is twenty times as selective as the ordinary radio set!

It has a power tube, too, that means you can turn up the volume, without losing the clear, undistorted tone. Mother can listen to the home talks, while she works across the room. In the evening, the lectures from the colleges are loud enough for the whole family to listen to. And a world of fine music comes in vividly and clearly, giving life new pleasure.

Radiola 20, with Radiotrons, . . . $115
RCA Loudspeaker 100, ... $35

It is in music that tone quality counts most. Tune in dance music or finest symphony concert, and Radiola 20 challenges even high priced competitors to any test of tone! It is a moderate-priced set, but it has proved that quality of performance is not a matter of price, but of design and manufacturing skill. Not only RCA, but its associates, General Electric and Westinghouse, have contributed to making this Radiola so remarkably fine that, when you hear it, you will be satisfied with nothing less in radio!

MILK STOOL PHILOSOPHY

J. J. SPRENGER, MINNESOTA

'HERE have been about as many reasons given for the reverses which came to the farmer and y others during the last four or years as there are people speak- about them; yet very little prog- has been made toward an ac- able solution, largely because we rying to explain economic forces changes in a political way with usual result. When we study omics we need a lot of light and eat, but when we study politics always get a lot of heat and no at all. Whether we understand or not, economic forces work on, slow but sure.

vo important truths have been looked. First, if this nation is to re, there must be a flow of tem- g blood and brain from the try to the cities or they will be- unfit places in which to live, be- humans were not intended to massed together in congested ps. But this movement comes in nse to an economic pressure h is in itself unrelated to the e results. As labor saving ma- s make our work more effective are always less people needed e the machines are used and more where they are made.

bout a dozen years ago the in- l combustion engine became ical. It saved much labor, but what is more, it made it possible for gasoline to displace the use of millions of bushels of feed grains like corn, oats, and the many other feeds. Naturally there should have been a flow in response to this extraordinary change, but the need of food for the war retarded it. When it did come it came in the form of an upheaval rather than in the normal way. It is not easy to accomplish as marked a change as had become necessary because there is always an insistent human craving to remain on the soil. Although it seems easy to take boys out of the country, it still remains a fact that after they are out they never have the country taken out of them.

The second truth easily overlooked is that even if legislative relief could be made fully ample and so that it would really reach the farm in an added price for our products, it could not long come any nearer to giving us the cost of production. Every added prosperity coming to us is always reflected in a corresponding increase in land values, thereby keeping production costs on the same level as before. This may help the man who has land to sell, and some of these may be accused justly with insincerity in urging relief for farmers when they are primarily interested in selling land at a better price.

dvertising With a Milk Bottle Sign

ARD'S DAIRYMAN:—As we were ng into Yuba City, California, ong ago, we were attracted by a electrically lighted milk bottle near a roadside market place. dairymen the country over are ning to see the value of advertis- s a means of increasing the use iry products, we stopped to ask Jeanette Donally who was dis- ng the milk at the Rosebud stand had noticed any growth in sales the sign had been put up. She is that far more tourists ask for now than did before.

e sign was erected by the Marys- Yuba Dairy without charge, on tion that the proprietors of the ud stand would keep it lighted they closed each evening. Mrs. ly said it is a very satisfactory arrangement because the profits from the extra sales much more than pay for the electricity used.

We stopped at the Marysville Yuba Dairy to talk with the manager, Mr. S. E. Watson. He designed and perfected the sign but he did not patent it so anyone may make one who cares to do so. He said he found this sign to be one of the most effective methods of advertising. He had not yet made a check on the increased business that had been brought about by the lighted milk bottles, but he was confident it was a good investment. The signs are now attached directly to the main lighting system of a stand or store because Mr. Watson has found that some people forget to light them if they are attached to a separate switch. About thirty signs have been erected in the two small cities of Marysville and Yuba City so a rather high percentage of the inhabitants see one or more of them every day and it would be safe to say that nearly all of the tourists who go through these two towns have milk brought to their attention because of them.

Wisconsin. G. A. PETERSON.

attractive sign outside the Rosebud at Yuba City, California, invites ourists and townspeople to buy more

Alfalfa Hay Vs. Alfalfa Meal

The Institute of Animal Nutrition at Pennsylvania State College conducted some experiments to determine the comparative net energy values of alfalfa hay and alfalfa meal.

It was found that the net energy value of alfalfa hay of excellent quality when coarsely cut in a silage cutter is essentially the same as when finely ground into meal.

The net energy of any feed is defined by Henry & Morrison as the amount of energy left after deducting from the available energy the losses of energy in mastication, digestion, and assimilation of the feed.

The net energy of a feed is that used to maintain the body, not including requirements of digestion, following which if there be a surplus it may be used for growth, fat, milk, or wool or in performance of external work.

NATIONAL FRESH WATER SYSTEM

Nothing to freeze

PUT the National Fresh Water System wherever most convenient — in *unheated* garage, barn, milk house, basement — anywhere! Think of that!

"Will it freeze?" No! Because air *only* is stored in the tank and every water pipe is laid below the frost line.

"Must it be near the well? Must I build a separate power house?" No! Because the National can be placed 10 feet or 10 miles from the water supply.

New National Power Unit as Perfect as Our "OK" Pump

For several years our engineers have been developing a new type power plant. The result is a unit with a patented Sleeve-Valve compressor. Everyone acclaims it as great an advance as the "OK" National Pump, now over 400,000,000 gallons beyond experiment. First, it entirely does away with the troublesome check valve, making air leakage impossible. Second, makes the usual unloading valve for starting unnecessary. Third, assures easier, quiet running, giving you more water at less power consumption. Now, when you install a National Fresh Water System, you get:

1. New dependability from pump and power unit.
2. Fresh water, instantly, direct from the well to every faucet.
3. Also soft water from cistern, lake or stream, pumped by the one power unit.
4. Protection against freezing. No water storage tank or exposed pipes to freeze; no fouling of water in Summer.
5. Installation convenience. Put power unit in unheated garage, shed, basement or barn—anywhere within ten feet or ten miles from water supply.
6. Any lift up to 150 feet.
7. Choice of motor-driven or engine-driven power unit. Capacities, 200 to 2,000 gallons per hour.

"OK" National Single Cylinder deep well pump. Submerged in water inside of well casing (fits 4, 5, and 6-inch casings). Also supplied for shallow submergence in open water. Lifts water 150 feet with strong faucet pressure. No pump head above well; no clanking pump rods.

Write for free copy of interesting 32-page book, "FRESH WATER" —a real aid to anyone planning on a water system for farm, suburban home or public buildings.

DAIRY MARKET NEWS

January Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers for 3.5% milk delivered at factories during January is based on reports made by condensed milk and evaporated milk firms.

Geographic sections	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.40	$2.40
Middle Atlantic*	13	2.37—2.80	2.60
E. No. Central	81	1.95—2.59	2.28
W. No. Central	6	1.97—2.30	2.17
North Western	7	1.58—2.10	2.01
South Western	10	1.85—2.20	2.09
United States	118	1.58—2.80	2.28

*Fifty-three additional factories reported prices to be based in part on the current month's wholesale butter quotations. Twenty-seven factories reported prices not determined, and 20 reported plants closed.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for December:

	Range	Ave.
Condensed, per case	$5.60— 6.55	$ 6.02
Condensed, per cwt.	9.28—13.00	10.26
Evaporated, per case	3.80— 5.05	4.35
Evaporated, per cwt.	7.42— 9.80	8.75
Condensed skim, per cwt.	4.25— 7.00	5.99
Evaporated skim, per cwt.	2.75— 4.44	3.55

January Cheese

Cheese prices on Wisconsin Boards advanced one cent during January, and are now one cent above prices prevailing a year ago. A small decline was registered during the latter part of the month and the first ten days in February. The average for January on Single Daisies was 25.5 cents as compared with 24.3 cents a year ago, and 24.8 cents in December.

Cheese production for 1926 was 417,728,000 lbs., a decrease of 5.8 per cent from 1925. Net imports were 74,518,000 lbs., an increase of 21,305,000 lbs. over the previous year. The total storage at the end of the year was 71,920,000 lbs., or 4,729,000 lbs. less than a year ago. This indicates a trade output of 496,975,000 lbs., an increase in consumption of two per cent over 1925.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during January:

	Jan. 1927	Dec. 1926	Jan. 1926
	Cts.	Cts.	Cts.
Twins	24.7	24.5	23.5
Single Daisies	25.5	24.8	24.3
Longhorns	26.5	25.7	24.6
Square Prints	26.6	26.5	25.4
*Receipts, since Jan. 1	11,990	195,358	14,450
*Receipts for month	11,990	15,126	14,450
*Storage (end of mo.)	13,929	16,598	21,103

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted).

December Dry Milk

(From Report by U. S. Dept. of Agr.)

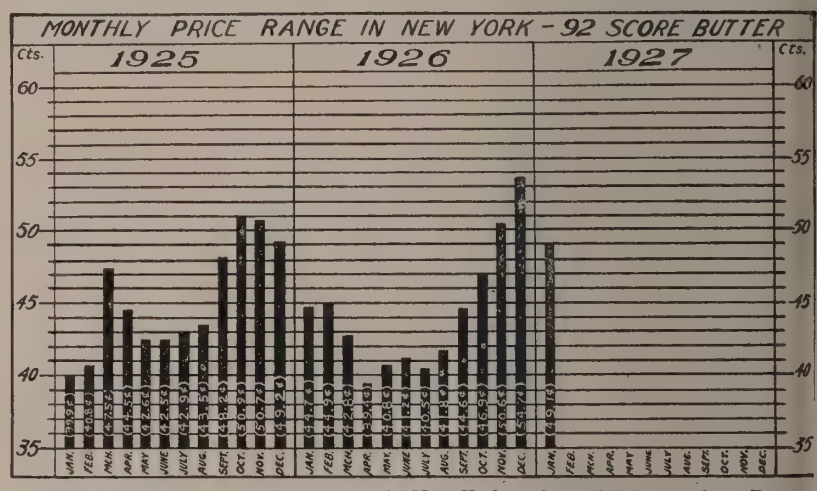
The wholesale prices given below are based on reports from manufacturers governing actual sales F. O. B. factory during December:

Dry Skimmilk: Prices ranged from 7.5 cents to 13 cents for dry skimmilk in bulk, averaging 9.8 cents a pound for sales, totaling 6,081,648 lbs. When packed in one-pound cans the price reported was 29.2 cents a pound.

Dry Whole Milk: Prices ranged from 20 cents to 29.5 cents for dry whole milk, averaging 26.7 cents for sales totaling 519,989 When packed in one-pound cans the price ported was 44.8 cents a pound.

Dry Buttermilk: Prices ranged from 6 c to 10.5 cents for dry buttermilk in bulk, av aging 8.9 cents a pound for sales total 1,335,556 lbs. When packed in one-pound c the price reported was 10.8 cents a poun

January Foreign Butter



The following table of January fore butter prices gives the average of wee quotations as published by the U. S. Dep ment of Agriculture:

Market	Jan. 1927	Dec. 1926	J
	cents	cents	ce
New York	49.1	54.7	
Copenhagen	36.1	37.1	
Berlin	37.1	39.3	
London:			
Danish	38.9	40.2	
New Zealand	36.4	36.8	
Australian	36.8	36.2	
Argentine	34.4	32.2	

Wisconsin December Butt

Wisconsin co-operative creameries paid ducers a net price of 58.1 cents a pound butterfat in December according to rep from 96 of these creameries to the Wisco Departments of Markets. These creameries ceived an average of 51.4 cents a pound butter, making a spread of 6.7 cents betw the price received for butter and the p paid for fat.

The range of prices paid for fat was f 52.1 to 64 cents, with the price received

Butter in January averaged 49.1 cents in New York, a drop of 5.6 cents from December. However, it is 4.4 cents above January of last year and 9.2 cents above January of 1925.

January Butter

December butter broke sharply at the of the month, followed by a sharp reco in the fore part of January. This reco was of short duration and declines were istered until nearly the close of the m Prices advanced again and on Februar the New York price was 51 cents, or five above the lowest point in January. The ket appears nervous, with firmness regis one day and nervousness the next. The erage price of New York butter was 49.1 approximately five cents under December 4.5 cents over January of last year.

The statistical position of butter is goo both production and surplus are less th year ago. Receipts at the four markets lighter and withdrawals from storage larger than last year, indicating a lower able supply at these markets of 15 m pounds on February 10. The one factor ing down prices is the fear that consu will not take butter at the higher prices

The total production of creamery butte 1926 was 1,345,389,000 lbs., which is 16 lion pounds less than 1925. Farm butter duction is estimated at 580 million pound ten million pounds less than the pre year, making the total production near

Wisconsin January Condensery Prices

Forty-six condenseries reported to the consin Department of Markets the prices in January per hundred pounds milk d ered at their factories. Reduced to a com 3.5 per cent test basis, these prices ra from $2.06 to $2.96, the average being $2.

Sixteen factories sent delayed reports December, the average being $2.31. Thi ten cents above the previously reported age of $2.21 for 50 factories.

er cent less than in 1925. Net imports were ,546,000 lbs. and the decrease in storage mounted to 18,430,000 lbs. This indicates a otal consumption of 1,946,365 lbs. butter, a ecrease of 20 million pounds (one per cent) nder 1925.

Daily quotations from the U. S. Department f Agriculture show the following average holesale prices on 92-score butter (extras) t four of the principal markets, together with eceipts and storages:

	Jan. 1927	Dec. 1926	Jan. 1926
	cents	cents	cents
hicago	48.1	52.5	43.0
ew York	49.1	54.7	44.7
oston	49.5	53.7	45.2
hiladelphia	49.7	55.7	45.4
Receipts for month	36,687	35,141	40,626
Receipts since Jan. 1	36,687	558,334	40,626
Storage (end of month)	10,208	19,620	19,753

*In thousands of pounds at the four markets i. e.—000 omitted), ninety score butter averged 46.8 cents for January in Chicago, with entralized butter at this market selling for 7.4 cents. Jobbers prices on extras sold to etailers averaged 50.6 cents in Chicago, a pread of 2.5 cents above wholesale.

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage oldings of dairy products on February 1, figres being given in thousands of pounds (000 mitted):

	Feb. 1 5-yr. av.	Feb. 1 1926	Feb. 1 1927
	lbs.	lbs.	lbs.
utter, creamery	30,309	39,381	17,967
heese, American	36,084	50,339	46,078
heese, Swiss	6,942	8,856	8,131
heese, Brick	1,557	2,126	1,631
heese, Limburger	880	1,293	1,477
heese, All other	5,227	4,917	4,869

These holdings include stocks in both cold orage warehouses and packing house plants.

Philadelphia Milk Prices

The Inter-state Milk Producers' Association nnounces that the February basic price for ilk will be $3.29 F. O. B. Philadelphia and 2.71 per hundred at receiving stations in 51—0-mile zone.

The January surplus prices were $2.55 first rplus and $2.15 second surplus F. O. B. hiladelphia. The January surplus prices at ll receiving stations on railroad were $1.97 rst surplus and $1.57 second surplus.

These prices are based on milk testing 3 er cent butterfat with a differential of 2 nts for each half point of test up and down.

Connecticut February Milk

The Connecticut Milk Producers' Associaon announces the following prices for Grade milk delivered during February at market ilk centers:

All milk sold in the fluid form, 9.5 cents per uart for 4 per cent milk, and 4 cents per oint allowed for other tests; all milk made nto cream that is sold in fluid form, 10 cents er pound fat above the average monthly rice of 92-score butter on the Boston market: l milk made into butter, at a price per ound fat equal to the month's average on 92-ore butter in Boston.

Milwaukee January Milk

The Milwaukee Co-operative Milk Producers nnounce the following prices for the month January:

For the portion sold as fluid milk, $2.90 per wt.; and for the portion manufactured, $2.09 er cwt. These prices apply to 3.5 per cent ilk delivered f. o. b. city, four cents being dded or substracted for each one-tenth of one er cent variation in test. Seventy-one per nt of the total receipts were sold as fluid.

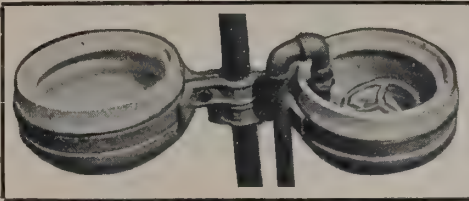
Sheffield January Price

The cash price for January, 1927, paid heffield producers, New York, for three per nt, Grade B milk in the 201—210-mile zone $2.64 per hundred pounds, with the usual eight and butterfat differentials. This is quivalent to $2.84 for 3.5 milk.

Makes Good Record

Edna Segis Walker, an 8-year-old aughter of Matador Segis Walker, ecently completed a year record of 3,341.5 lbs. milk containing 875.15 s. fat (1,093.94 lbs. butter), in the arns of the Carnation Milk Farms.

She is one of the older daughters this sire, born before he was purased by Carnation Farms. Nineen of these older daughters have ade records which average just short of the thousand-pound mark with five of the records made by two- and three-year-old heifers.



Wisconsin Sells 72,770 Dairy Cattle

A recent statement from the Wisconsin College of Agriculture shows that the farmers of that state have sold 72,770 head of cattle, exclusive of those for slaughter, to out of state buyers in 1926. This is the largest number ever sold from the state in a single year. The sale figures for 1925 were 58,446 head.

A Correction

In our January 25 issue, Annis of Walhalla, a Brown Swiss cow, was credited as a world's record holder for all ages in the 305-day division. Our attention is called to the fact that this honor belongs to Silver Bell, a mature cow owned by the Iowa Brown Swiss Co. She produced 17,692.9 lbs. milk, 772.98 lbs. butterfat in ten months.

All I have seen teaches me to trust the Creator for all I have not seen.—Emerson.

The Last Word in Modern Barn Equipment

Glazed Stoneware Salt and Mineral Feeders and Water Bowls. If you want healthy cows and high production then let the cows regulate salt and water themselves. We fit any make equipment. The large, heavy cups held by springy clamp have proven themselves unbreakable for livestock. Guaranteed. We sell direct. Sample feeder $2.00. Sample waterbowl with valve $3.50. All prepaid. If steel post state size. Literature free. Dealers wanted.
IDEAL SALT FEEDER CO., Morristown, Minn.

NEW!

Low Model Melotte

It's Here

NOW!—for the first time, the farmers of America have a chance—*if they act quick!*—to see and USE, on 30 days' free trial, the New Low Model Belgian Melotte Cream Separator.

AT LAST!—a shipment of 2,000 of these new models has arrived—and if you write us at once, before this supply is quickly exhausted, you will have an opportunity to get a New Model Melotte for 30 days' free trial. But don't delay!

The World's Leading Separator has taken a NEW Leap Forward! In ADDITION to the unsurpassed and unsurpassable Cream-separating efficiency and durability for which the Melotte has been world famous for 38 years, you NOW have, in the New Melotte, a greater convenience, a greater ease of operation and a more complete, all-around satisfaction that was ever known before. There is a new, swinging steel supply tank, waist high for your convenience. It is lined with white bath-tub enamel. Easy to handle. Easy to drain. Easy to wash. Sanitary! See the many OTHER refinements and improvements which have started the whole dairy industry of Europe talking!

Of course, the Melotte's wonderful Self-Balancing Bowl is NOT changed. A Bowl that NEVER gets out of balance—a Bowl that has NEVER had to be rebalanced—NEEDS NO CHANGE! YOU CANNOT IMPROVE PERFECTION!

Write for Special Low Introductory Price Offered NOW! Act Quick!

We KNOW that the New Melotte is going to be the talk of the dairy farmers of America—just as it now is in Europe—so, we are now making, for a short time only, a special low introductory price, to get this new model in the hands of American farmers right away. The price on later shipments may be considerably higher. Save money by acting NOW!

OUR CLAIM Which we Stand Ready to Prove

We claim that year in and year out, over a period of ten—twenty—thirty or more years, the Melotte will put the most cream in your cream can. The most cream because with its suspended, single-Bearing self-balancing bowl, the MELOTTE skims perfectly during its entire lifetime and never wastes any cream. The most cream with less expense, because the hand balanced separators wear themselves out of balance and waste cream before each rebalancing. There are no Melotte rebalancing bills, as it never, never gets out of balance.

Don't Pay for 4 Months

Write for the new Melotte literature today and find out how you may have the new model 77 Melotte on the same terms as the old Melotte. Don't pay for 4 months. Or, if you choose, pay only $7.50 down after 30 days' free trial and then $7.50 per month.

Take this Melotte and set it up on your own farm. That's the right place to select a cream separator. Use it there just as if it were your own. Give it any test. After you have skimmed sixty times you will know it gets all the cream. You will know how handy it is. You will know how easy it turns. Your wife will know simple it is to wash. You will know the reason why we haven't been able to get any of these new Melottes until now.

Write for Full Details!

of this Great New Separator

Get the facts yourself. That's the first thing to do. Then you can decide. Don't be rushed into buying a separator from anybody until you have found out all about the new Melotte, until you have tried it right on your own farm. Remember, you get a whole year to pay for it. When you have a new Melotte, you are through buying separators forever; for the new Melotte lasts a lifetime and stays in perfect balance every minute. Even if you won't need a separator for several months, let us tell you about the New Low Model 77 self-balancing bowl Melotte.

The Hygiene of Sleep

A large audience of women of every kind and calling went home from the first session of Farmers' and Homemakers' Week at Madison, Wisconsin, all set to take the sleeping of their respective families more firmly in hand.

Mrs. Nellie Kedzie Jones, known all over the—well, where is she not known in this field?—was put on the program to talk on this often uninteresting subject. Most people would rather hear about clothes or food or anything else, but this audience knew its speaker so they sat right forward to hear about sleep and, true to form, Mrs. Jones gave them something to smile about, something to think about, and something to do—all in the inimitable way she has that makes people remember what she says.

We all came away thinking about sleep and while it is fresh in my mind I want to remind you of some of the things that probably you know, but forget in the rush of the work to put into practice.

We don't know as many facts about sleep as we do about food, exercise, and some of the other things that help us to live long and do it successfully but we do know that man will die more quickly from lack of sleep than he will from lack of either food or water and it is reasonable to suppose that the results of going with an insufficient amount of sleep are just as serious as are those of going with too little food.

"What do you mean by vitality?" Mrs. Jones asked a well known physician.

"Vitality," he replied, "is the thing that keeps one man alive when another, without it, would have died under the same circumstances—and sleep is one of the best known means of producing vitality."

"Oh, but I just can't sleep. I never could and my mother was a poor sleeper before me!" How many times we have all heard that cry and how many times we have wondered if that person is doing anything to remedy the situation or if she (or he) is just sitting back, accepting the inheritance. Of course, we all know that most poor sleepers sleep a great deal more than they think they do. If they didn't they wouldn't be alive. Sleep habits are much more easily learned in childhood but older persons can acquire them if they set their minds to it. A high-strung person I know was told by his doctor that he was to take a nap every noon right after eating. I expected to hear him reply that he simply couldn't sleep in the daytime and there was no use trying. But this man valued his health enough to make the effort and in a short time he was able to go to sleep within a few minutes of lying down.

Sleep is truly "Nature's sweet restorer" for older people and for children, one of the very foundations of their health. How many of our high-pitched, hair-trigger friends would be as they are if they had been taught to sleep properly when they were little.

"I don't understand why people don't put their children to bed when they should," ventured one woman to Mrs. Jones.

"It's nothing but lack of backbone," was the reply. "I went into a home in the evening not long since where the children, querulous little things, were lopping around on chairs, floor, or any place except where they ought to have been. I suppose I looked surprised for the mother said, 'Oh, they just won't go until we do.' An open confession that it was the children, not the parents, who were running things.

"In other homes the first opposition is met firmly and presently sleep habits are so deeply rooted that it never occurs to the child to resist. That means power, strength, and health all their days."

The hours before midnight are the best for sleep and the young girl who wants to be beautiful and remain so will remember that the doctors say this is the time for real beauty sleep.

The old saying about "seven hours sleep for a man, eight for a woman, and nine for a fool" is no more than the saying of a person who wanted to make a glib remark. Find out how much sleep you personally thrive best on and then get it. If you discover that you need nine hours, don't let anyone keep you from getting it, for you will be worth all the more when you are awake.

If it is really true that such men as Napoleon and Edison required only four or five hours sleep out of the 24—personally, I have always crossed my fingers when I heard that said—then they are as exceptional in that respect as they are in their achievements and no more capable of being copied.

If you are one of those persons who has not been taught to sleep, you can still remedy much of the difficulty by putting yourself in the best possible health and then be willing to sleep go to bed expecting to do so. You remember the old story about the woman who had been reading about the faith that would remove mountains; how she prayed for the removal of a certain mountain and then rose from her knees saying, "There it is just as I knew it would be." So don't say, "No, I didn't sleep; I knew I wasn't going to." Expecting to goes a long way.

Then a little something in the stomach helps. No hungry person sleeps well and even if you are not hungry it often brings on drowsiness to drink a cup of warm milk or eat a bit of something light just before retiring.

Then, of course, the advantage of having a good bed is obvious, as Miss Wealthy Hale pointed out following Mrs. Jones' talk. It's nice to have a handsome bedstead but never get one at the sacrifice of good springs and mattress. These things last a long time and even a well person spends a good deal of time in bed, so why not be comfortable.

A hair mattress is fine but most of us cannot afford such a luxury and besides there are many good cotton mattresses on the market, much cheaper, that will give us good comfortable service for 20 years, with proper care. Box springs are the most expensive and, unless made to suit the individual user, are not always the most comfortable. Coiled springs are extremely satisfactory and even the cheaper slat spring will give excellent service.

Light-weight covering has always been a hobby of mine. It is, unfortunately, a little more expensive, but so worth while for children, or delicate people, or those whose sleeping has to be coddled a little. Wool bat comforters have about half the weight and twice the warmth of the same size cotton comforter and if you cannot afford them for all your beds, it is worth while to have one, at least, for special occasions.—LUCY THOMPSON.

This is the bedroom of Amanda Hass of Indiana, which won first place in the Vanderburg County Bedroom Improvement Contest. The first score on this room in its original condition was 48½% and the final score when the contest closed was 98%, or almost perfect; making an improvement of 49½% at a total cost of only $28.19 and lots of good, hard work. Miss Hass scrubbed the floor with lye in order to remove all of the old paint and then refinished the floors, woodwork, and furniture and papered the walls, doing most of the work herself.

Those Delicious Mints

"Your mints are perfectly delicious" (they were store mints), said a young society matron to her hostess after the refreshments had been served at a bridge party.

"You know," the young hostess laughed in reply, "I tried once to make some and they did look lovely but when I went to get them after they had cooled they were just one solid, straight mass."

"Did you ever try making them with a mashed potato?" asked another.

No one had and all about the two bridge tables wanted to know how

Style is not a matter of money. The woman who spends the most money on dress is not necessarily the best dressed. Very often her neighbor, with much less money to spend, will look more smartly clothed. It's largely a matter of taste.

In our Spring Fashion Magazine, we present a wide range of styles that are new, smart, and in good taste. For each one a pattern is offered and the designing is so clever that the styles are easily made.

In addition to afternoon and evening frocks, there are styles for wear around the house, also lingerie, children's clothes, embroidery, and some picture dressmaking lessons that are of interest to anyone who sews and of real help to the beginner.

Send 10 cents today for your copy of this book. Its style value is much greater than the price you pay and will be saved many times over on patterns. Address Fashion Dept., Hoard's Dairyman, Fort Atkinson, Wis.

it was done and exclaimed over the easiness and quaintness of it.

The young lady went on to explain that one was always sure of their mints when made in this manner: Take one fair or medium sized potato and mash it well. Add gradually pulverized or confectioner's sugar. As the potato is hot it will melt the sugar and about a pound can be beaten into one small potato. It wants to be of a consistency to be easily handled. When there has been all the sugar added that the potato will absorb, divide into as many portions as you wish flavors. If one wants only peppermint and wintergreen creams divide into two portions. Add the peppermint flavoring, a little at a time, and work in well, tasting often to be sure you have the desired amount. Then shape in little round patties by taking a small ball of the confection between thumb and forefinger of left hand and turn with the thumb and forefinger of right hand until you have a satisfactorily shaped cream. Beside the flavoring add a little red coloring to the wintergreen creams until the beautiful pink color has been obtained.

Other flavors that may be added to this uncooked fondant are maple, almond, orange, and vanilla. If the maple flavored fondant is wrapped around a raisin and a walnut meat placed on top it makes a delicious looking as well as tasting confection. The almond fondant worked around a marachino cherry and dipped in chocolate is a candy that will just melt in one's mouth. Orange, too, is very appetizing dipped in chocolate, while if cocoanut is added to the vanilla and shaped in bars it will delight the sweet tooth of any child or grown-up.

One will find that the flavoring extracts will soften the mass of fondant somewhat so a trifle more sugar may need to be added before the creams will be hard enough to shape. For the cocoanut ones a bit more mashed potato will need to be added in order to allow the cocoanut to be worked in nicely.

For the price of a pound of sugar and a tiny bit of flavoring, nut meats, coloring, and perhaps chocolate, one can make beautiful candy that would cost at least sixty cents a pound at almost any confectioner's shop.

By the way, the almond flavored candies are beautiful colored a delicate green.

At a bazaar held by one of our churches these candies found a ready sale and the only complaint found was, there weren't enough of them.

"Well, I declare," said all the young ladies after they had asked every question they could think of and had had a satisfactory answer in return. More than one remarked that she was so glad to learn of such a simple method of making fondant, as the cooked fondant was usually so risky to try to make unless one had candy theremometers and everything just right to do with.—ELLEN A. ELLIOT.

Four Ways of Serving American Cheese

American Cheese Pudding: ½ cup tapioca, 2 eggs, 1 cup water, 1 tablespoon butter, 1 cup milk, ¾ teaspoonful salt, 4 tablespoons grated cheese. Soak tapioca over night; cook 30 minutes in double boiler, then bake brown 30 minutes. 1 cup bread crumbs or 1 cup canned corn may be substituted for tapioca.

American Cheese Loaf: 1 cup cooked rice, 1 cup mashed potatoes, 1 tablespoon minced onion, ⅓ cup grated cheese, 2 teaspoons salt, 1 cup peas, ¼ cup canned tomatoes. Combine ingredients and shape the mixture into a loaf. Bake in a slow oven 30 minutes. Serve with tomato or horseradish.

American Cheese and Baked Cereal: 2 cups cooked cereal, 1 cup grated cheese, 1 tablespoon butter, 3 tablespoons corn meal. Put in greased dish and bake 30 minutes. Corn meal may be sprinkled on top. Corn or potatoes may be used instead of cereal.

American Cheese Soup: 2 tablespoons butter, 2 tablespoons flour, 4 cups milk, ½ teaspoon salt, ¾ cup grated cheese. Cook 3—4 minutes.

Since cheese is a soft and a highly concentrated food it is advisable to combine it in a meal with crisp foods as toasted bread or crackers or with fruits and vegetables.—MAYBELLE FRUIT.

Use of Rice in Soup

Rice as a thickening for highly flavored vegetables and with meat stock are general suggestions made by the Bureau of Home Economics for the use of rice in soups. Following are recipes tested by the bureau which may be varied in making other combinations:

Rice added to any kind of meat stock with a little parsley, bay leaf, or thyme, or a pinch of celery seed for seasoning makes a palatable as well as a nourishing soup. Also, rice makes excellent thickening for soups made of highly flavored vegetables, such as tomatoes, asparagus, celery, or onions.

Cream of celery or asparagus with rice is made with the following ingredients: One-half pound celery or asparagus, one-fourth cup rice, one quart cold water, two tablespoons butter, drippings or other fat, one tablespoon chopped parsley or one teaspoon onion juice, two teaspoons salt, one-fourth teaspoon pepper and one quart milk.

Cut the celery or aspargus in half-inch pieces. Cook the rice and celery or asparagus in the water until both are tender. Press them through a colander and add the fat, the seasoning, and the milk and reheat. This will make five or six average servings.

Rice and chicken soup require the following ingredients: One-half cup uncooked rice, three cups chicken broth, three cups water or milk, one-half cup minced chicken, two tablespoons chicken fat, butter, or other fat, one-fourth teaspoon celery seed, one-half teaspoon salt, one-eighth teaspoon pepper.

Cook the rice in the broth and the water or milk until tender. Add the minced chicken, the fat, and the seasoning. The minced chicken may be omitted if desired. This will make five or six average servings.

Husband (watching wife in the kitchen): What is it this time, darling, bread or cake?

Wife: I don't know, dear; it isn't finished yet!—The Progressive Grocer.

Says Sam: It's probably wiser to change the kitchen to fit the wife, than to change the wife to fit the kitchen.

Roofing Paper as a Reliner for Silos

HOARD'S DAIRYMAN:—An inquirer in a recent issue of Hoard's Dairyman, asks as to the advisability of lining a stave silo with galvanized iron. Perhaps as practical material, and material that is more easily handled that will give longer service and costs less, is the use of ordinary smooth surface, two ply roofing paper.

The writer visited a silo a few days ago in order to see how roofing paper had lasted during the past 11 years, and evidently there had been no deterioration during that time. The silo was built of unmatched boards and lined with second grade roofing paper which at that time cost 90 cents a roll. The material in the paper had so cemented the paper to the sides of the silo that it seemed to stick as closely as paper on a wall. The former owner, and the man who built the silo, told the writer that the only repairs were in one or two small places where a fork had ripped a slit in the paper The rolls were hung up and down and were quite closely nailed. Perhaps the first silos that were built in this way, were erected around Sherman, New York, about 25 years ago, and the method was to secure the paper to the side wall by nailing thin strips up and down the interior of the silo. These silos gave good satisfaction.

In the writer's community there are several silos built within the last two or three years, in which rough boards were used, the corners rounded, and the silo lined with roofing paper, not the slated surface kind. These h given entire satisfaction, and in t particular community neighbors adopting the method of building repair. One silo visited by writer was built by this farmer had a large silo and two years divided it, lining it with roofing per. It has given the best of satisf tion and he has kept over silage ing the summer a year ago, and carry over this year a good pro tion of the contents of one silo.

The writer's own experience been satisfactory, and one side o matched lumber silo was cove with roofing paper. This year other sides will be covered. method, as we have our own fil will be to fill, and then line wit width of roofing paper so the lap the upper are on the outside of upper edge of the strip below. writer at one time patched a with roofing paper at the time it being filled. This was for a ne bor, and the silo had been lathed plastered. There were a numbe large holes and many small ones. strip of roofing paper would be t off, smeared with tar, and slap over the hole. Several nails dri around the patch held it in place, the neighbor said that the sil kept well, and that there was harm done due to the settling of silage as the patches all stuck

A good silo is worth all it costs for relining a stave silo or for li of a wood silo which is cheaply b a good grade of smooth surfa roofing paper will give remark service for 15 or 20 years. Th will be no need of painting the side and acid does not in any affect the paper. Of course t will be a question rising as to wh er or not the silage will be affec This doubt should cause no con for if the flavor is affected it w not be more than an inch or and the writer has seen no indica of cows refusing silage on this count.

Ohio. WALTER JAC

Waukesha Guernsey Meeting

The Waukesha County Guer Breeders' Association was organ to be of service to the breeders of county and it does exactly Those who were present at the an meeting at Waukesha, Wis., Feb know that the association serves efficiently as a sales organization.

The secretary's report for the year shows that the members $151,887.50 worth of Guernseys buyers from nineteen states and Canadian provinces. Twenty-thousand nine hundred ten do worth were sold at public sale, balance, $129,977.50, privat through the secretary's office. was not the best selling year the ganization has had but it was above the average for the past years.

Some of the figures in this re are interesting. Of the 940 Gu seys sold, 669 were grade cows heifers above a year old that bro an average of $134.14. One hun ten registered cows and heifers of same age averaged $244.15. Eig eight grade heifer calves bro $38.07 each while 15 registered he calves sold for $119 each. Fifty-e bulls of all ages sold for an ave of $142.16.

In his talk, Secretary Musser po ed out the fact that the Guer products label actually serves basis for selective registration s producers using the label are pr sure to weed out their unprofit animals and, after all, economic s tion is probably the only proper for selective registration.

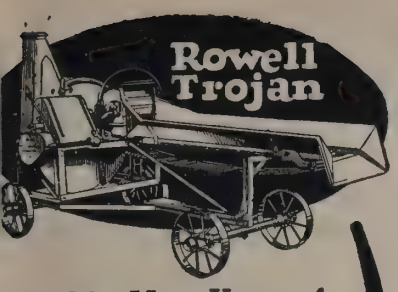
The happiest words in the world

A SAYING becomes universally popular if its expression recalls an experience of pleasure. "Have a Camel!" are the three happiest smoke words ever uttered because no other cigarette ever gave the world so much enjoyment. To millions of experienced smokers, Camels are contentment realized.

Camel has become the most popular smoke of all time because of quality. Camels contain the choicest Turkish and Domestic tobaccos that nature grows. Then these superb tobaccos are given a blending that can be found in no other cigarette. The largest tobacco organization in the world puts its all and its best into Camels. You could smoke, end to end, a mile of Camels—they will never tire the taste, never leave a cigaretty after-taste.



We invite you now to introduce yourself to the finest made.

Millions of friendly voices are calling you to the mildest, mellowest fragrance that ever came from a cigarette. Once you know what they mean, no words can compare with

"Have a Camel!"

Minneapolis Minnesota

Good morning! Have you seen my mother? She has been gone quite awhile. I am getting chilly and, besides, it's time to eat.

Corn Substitutes for Pigs

Corn properly supplemented is the ideal local grain for pigs. It is frequently limited in supply on dairy farms, however, and other feeds must be substituted. The price of a substitute feed and the comparative feeding value of that feed with corn are the important factors governing its selection.

Some corn by-products are valuable substitutes for corn. Hominy feed is worth from three to seven per cent less than corn in feeding value. When corn is $1 a bushel hominy feed is worth from $33 to $34 a ton.

Corn feed meal makes a satisfactory substitute for corn when it can be bought for no more than the cost of corn.

Corn germ meal, a by-product from the manufacture of hominy, glucose, and starch, is not a satisfactory substitute for corn but may be fed in limited quantities along with other carbonaceous feeds together with high protein feeds, such as skimmilk and tankage. A limited amount may also be fed to pigs on pasture.

Although wheat shows a higher feeding value than corn it is usually too high in price to justify its being used as a substitute. Wheat at $1.15 a bushel is worth as much as corn at $1 a bushel. Ground wheat produces more economical gains than whole wheat.

A good grade of flour middlings is worth about 89 per cent as much as an equal weight of corn. With the price of corn at $1 a bushel, flour middlings at $32 a ton would make a satisfactory substitute. Middlings has a higher value for feeding pigs than for finishing shotes. It should not replace corn entirely but is best fed with other carbonaceous feeds.

Ground rye has a feeding value of approximately 89 per cent that of corn. With corn selling for $1 a bushel one could not afford to pay more than 90 cents a bushel for rye.

Ground barley is used as a substitute for corn to a greater extent than any other grain. It is worth about 92 per cent of the value of corn. Ground and properly supplemented, barley is a satisfactory pork maker.

Dairymen are frequently tempted to feed oats to pigs. In doing this it should be remembered that oats are worth only about 75 per cent of the value of corn and even then should not constitute more than one-third of the grain in the ration. The feeding value of oats is reduced mainly because of the high percentage of hull or fiber. The pig does not make efficient use of feeds high in fiber. Oats should always be ground for pigs.

In supplementing these feeds it should be kept in mind that they are more or less deficient in protein and mineral matter. In a dry-lot experiment at the Ohio Station each pound of alfalfa meal added to corn and tankage, at the rate of 3 per cent of the total ration, saved 1.4 pounds of corn and one-third of a pound of tankage. In like manner 1.5 per cent of ground limestone in a corn and tankage ration saved 2.7 lbs. of corn and 0.43 lb. of tankage for each pound of limestone fed.

Skimmilk, tankage, and alfalfa hay or meal are the best of protein supplements. A mixture of equal parts by weight of salt, bone meal, and ground limestone to which is added 10 per cent of tankage to make it more palatable is a good source of mineral supplement.

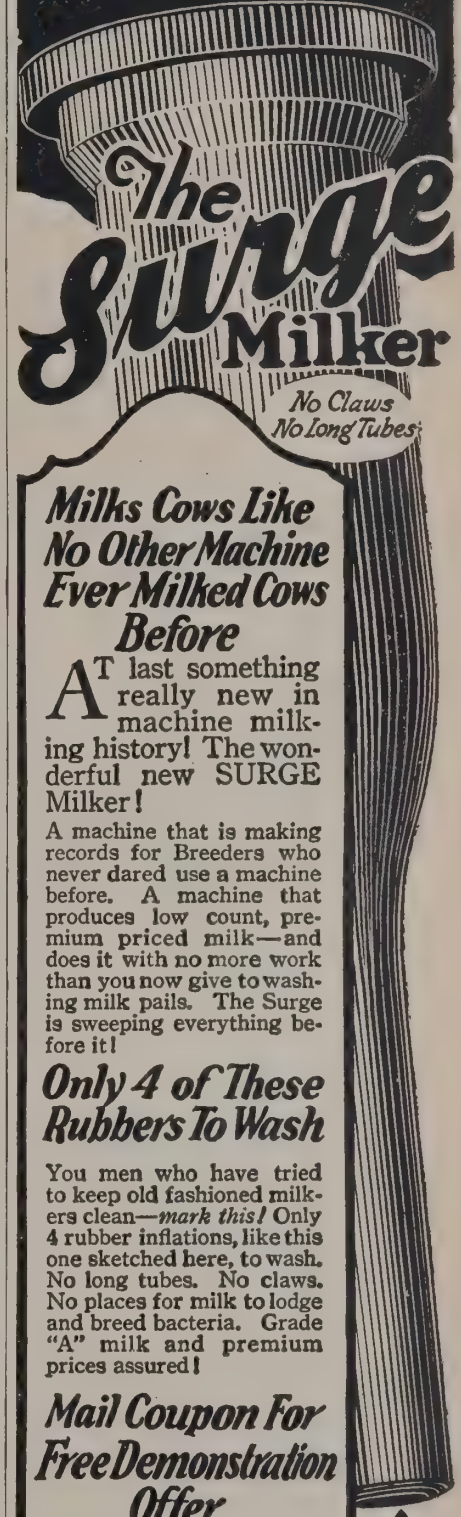
Composition of the Hog's Body

A builder of houses is able to calculate very closely the quantity of building materials to be used in a given structure because he knows what materials are needed.

It is no less important that a producer of swine know what materials compose the hog's body and approximately the proportion of these materials.

A hog's body is composed of water, protein, fat, and mineral matter. Of these, water constitutes about 58 per cent of the unfinished hog's body and about 43 per cent of the fat hog's body. Protein constitutes about 14 per cent of the unfinished hog's body and about 11 per cent of the fat hog's body. The hog before fattening carried about 25 per cent fat and after being finished about 44 per cent fat. Of mineral matter, 2.8 per cent of the unfinished hog's body is composed of this substance and 1.7 per cent when the pig is finished for market.

The mineral matter of an unfinished pig is composed of 10.79 lbs. calcium, 10.66 lbs. phosphoric acid, 1.96 lbs. potash, and .53 lb. magnesia per 1,000 lbs. live weight. For the fat hog these amounts are about 30 per cent less.



White Corn

Yellow corn is rich in vitamins; white corn is not nearly so good in this respect. When pigs are fed on good pasture the color of the corn makes little difference. In winter pigs fed on white corn and skimmilk frequently suffer from a lack of vitamins and become unthrifty, often showing symptoms of rickets. The Wisconsin Experiment Station has found that the addition of as little as 5 pounds of alfalfa hay of good quality to each 100 pounds of white corn made good the vitamin deficiency.

Water for Pigs

In an experiment at the Minnesota Experiment Station it was demonstrated that pigs having water before them at all times drank one-fourth more than the pigs watered by hand three times daily. However, there was no significant difference in the rates of gains of pigs given water by the two methods.

Wonderful New Method

Milks Cows Like No Other Machine Ever Milked Cows Before

AT last something really new in machine milking history! The wonderful new SURGE Milker!

A machine that is making records for Breeders who never dared use a machine before. A machine that produces low count, premium priced milk—and does it with no more work than you now give to washing milk pails. The Surge is sweeping everything before it!

Only 4 of These Rubbers To Wash

You men who have tried to keep old fashioned milkers clean—*mark this!* Only 4 rubber inflations, like this one sketched here, to wash. No long tubes. No claws. No places for milk to lodge and breed bacteria. Grade "A" milk and premium prices assured!

Mail Coupon For Free Demonstration Offer

Mail coupon below—*now*—and we will install the Surge Milker complete in your barn—*Free*—and show you what it will do on your own cows. No costs or obligations.

This is the famous patented Surge Inflation U. S. Patent No. 1,397,840

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

How to Cull Poultry

How many of you juniors can pick out the good layers in a flock? Can you tell by handling a hen or pullet if she is laying enough eggs to pay her board bill?

Culling poultry and culling cows are much alike. In both cases you are separating the producers from the non-producers. Points of conformation in *good* producers are quite similar, whether chickens or cows. Two things are found in all good producers, capacity and producing ability. These can usually be determined by observation and handling.

When is the best time to cull poultry? The answer is the same as for culling cows, "All the time!" Put a ring around the months of July and August on your calendar, save this page, and give the flock a good thorough going over at that time.

How many eggs should a good producer lay? At least 150 eggs a year. When she lays only eight or ten a month, she hardly pays for her feed.

What are some of the signs of a *good* producer? Late to bed and early to rise is not just what Benjamin Franklin suggested to make one "healthy, wealthy, and wise," but it is a pretty good rule for picking out the hustling hens and pullets. It takes work to make eggs.

If "contented cows are good producers," then don't you think that "happy hens should be good layers?" The birds that sing at their work are the kind to keep. Generally, too, good layers are easy to tame and handle.

Did you ever pick up a bird and examine her toenails? If they are short and well worn, that means she scratches for her living. Look out for the long toenailed birds. Maybe they are not earning their living.

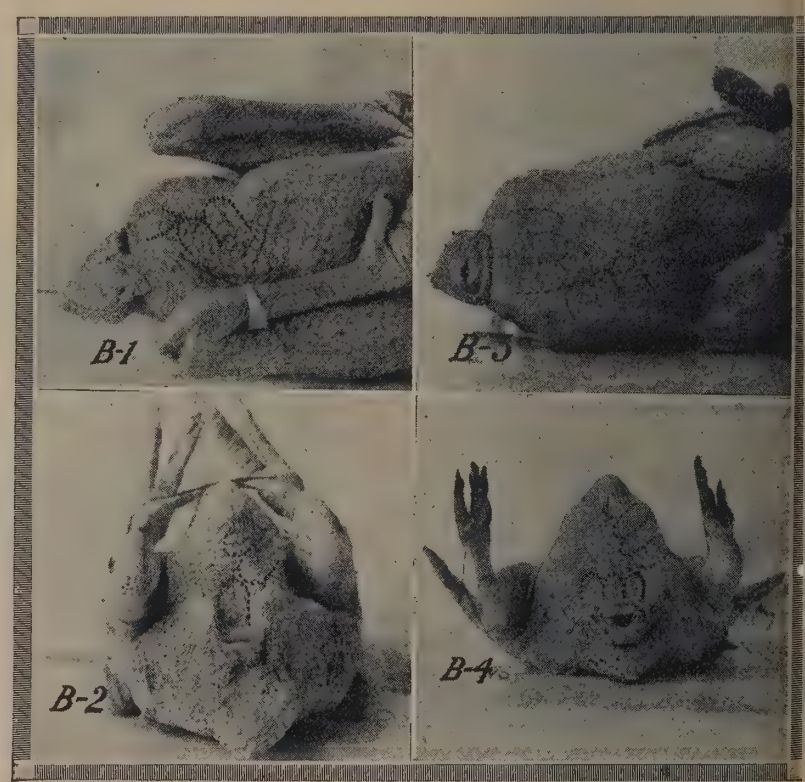
Fading is another sign of a good producer. In the yellow skin breeds the color gradually fades f the vent, eye rings, beak, and sha in the order named. This color g into yolks. Compare the color v that of the male as his color is typ of the non-producer. Hens fed tions containing no yellow corn green stuffs are likely to have fa beaks and shanks even when t are not laying.

Are there any cripples in y flock? Do any of your birds h frozen feet or weak legs? Th troubles would certainly interf with their working ability. Are th any very thin hens, or birds v crooked backs? Get rid of cripples!

Which hens eat the most fe Other things being equal, th should be the best layers.

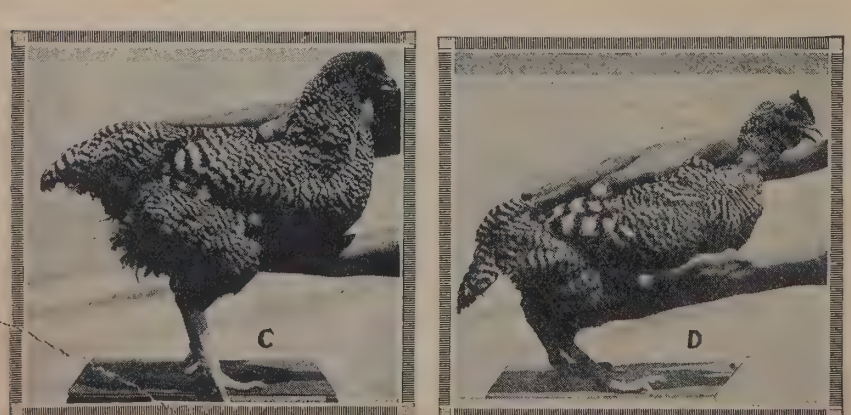
What kind of a ration have been feeding the flock? Before g ing be sure the hens and pullets getting enough of the right sort feed to make eggs.

Should you keep more pullets t hens? Yes. An average farm f should be made up of about two-th



Photos Courtesy Dr. B. F. Kaupp, N. Carolina Experiment Station

Early complete molters are poor layers. These two pictures were taken on the same day, August 16, of hens in the same flock. The hen on the left molted July 25 and did not lay until the following spring. She laid 102 eggs. The hen on the right did not molt until October and laid 152 eggs for the year.



Courtesy Kansas Agricultural Experiment Station

First, examine the head. A hen like a cow reveals producing ability in the character shown by her head. A good layer generally has well developed comb, wattles, and ear lobes, a full bright eye, and a short, well curved beak. A-1 and A-3 show side and front views of such a head. A-2 and A-4 show two views of a poor producer. Note the sunken eye, shriveled comb, and prominent eye ring. Get rid of the crow headed birds. Now go to the other end of the bird and measure the pubic span and abdominal capacity.

Courtesy Dr. B. F. Kaupp, N. Carolina Experiment Station

The two pubic or lay bones are located below and on each side of the egg vent. I good layers they are wide apart, three fingers. The abdominal capacity is indicated b the space from the pubic bones to the rear of the breast bone, four fingers in goo layers. B-1 and B-2 are two views of the carcass of a poor layer. Note also the coarse rough skin as compared with B-3 and B-4, the carcass of a good producer. How thes measurements are made is shown below.

Photos Courtesy Kansas Agricultural Experiment Station

The relation of the keel to the back indicates production. On poor producers the finger tips of the lower hand point upward, C; while they point downward in good producers, D. The first year's production for these two was C 97 eggs, D 187 eggs.

Photos Courtesy Kansas Agricultural Experiment Statio

Measuring abdominal capacity, E-1 poor, E-2 good, and pubic span, F-1 good, and 1 poor, on the live bird. The egg vent of the good producer is large and moist, E-2; of t non-producer, small and dry, E-1.

oullets and one-third hens. As a rule, he older the bird the fewer eggs he lays in a year. Hens that can keep their production up year in and year out are the ones to keep for breeding.

Having given the flock a general survey and marketed the cripples and those that spend the most time on the roost, the next step in culling is to handle and give each bird a close examination.

Comes the day of reckoning. Put the catching crate outside the small entrance to the poultry house, and give it full of birds. Have a crate ready for the culls. From the catching crate take the birds one at a time, and examine them closely. If lousy put a little blue ointment about the size of a pea, around the egg vent. Watch out for diseased birds.

Just as the cow's usefulness is measured by the milk scales and the Babcock test, so the hen's usefulness is measured by the number of eggs she produces. Check up on the culling. Keep the culls for awhile and give them a fair chance to show their stuff. Compare their laying with the rest of the flock. If they don't lay, off to market they must go. The illustrations accompanying this article show how to examine hens for good and poor production.

Courtesy Kansas Agricultural Experiment Station

Evidence of a good producer—a quality head, a vent indicating present production, and egg organs that show a high rate of production.

Our Review Column

[A regular feature of the junior department, viewing the contents of Hoard's Dairyman or the previous issue. Let's talk it over.]

For further discussion of the following see the February 10th issue.

Why put lights in the hen house? To give the hen a 12-hour day the year round which lets her eat more, drink more, work more, and lay more. (See page 111.)

Who first discovered this? In December, 1889, Dr. Waldorf, a Buffalo physician, tried the experiment of lighting his hen house to reproduce the long working days of summer.

How much air does a cow require? To supply her with good air requires about 3,550 cubic feet per hour. (See page 112.)

How much moisture does a cow exhale? A cow eating enough feed to produce 33 lbs. of milk a day will exhale about 40 lbs. of moisture into the barn in 24 hours. A herd of 15 such cows would exhale about 75 gallons of moisture.

Why does a cow need plenty of water to drink? Because milk is 87% water. Also, water plays an important part in digestion, in the elimination of waste, and in the regulation of body temperature.

How much mineral substance goes into milk? In 10,000 lbs. of milk there are about 70 lbs. of minerals.

Where is the home of the Brown Swiss breed? The original home of this breed is in Switzerland where it has been developed for many centuries. It is probably one of the oldest breeds in existence and very pure. (See page 113.)

How many Brown Swiss are there in the United States? About 8,000 registered animals and 162,000 grades scattered in 25 states. The largest numbers are found in Wisconsin, Illinois, New York, Minnesota, Michigan, Iowa, Pennsylvania, and Ohio.

How has Dougan solved his milk marketing problem? 1. By producing a high quality product in sufficient quantity to satisfy the demand. 2. By advertising. 3. By giving full value for price received. 4. By having one price for all. For 6 years he has been getting 20 cents a quart. (See page 114.)

Boys and Girls

Join the Juniors. No costs to you. If some member of your family is a subscriber to Hoard's Dairyman and you are under 20 years of age use the coupon.

Winter reading
that saves you money on rope

You can turn leisure hours into real profit, and have an interesting time doing it, with our new 50-page illustrated booklet—"More Jobs from the Same Rope."

Prepared especially for the farmer, this booklet is thoroughly practical. It tells you how to make your rope last longer and work harder. How to make the best knots, hitches, and splices for every job on the farm. How to care for rope. How to tell good rope from the ordinary kind—etc.

This valuable book will save you time and money. Send for it today, enclosing 15c—only a fraction of its cost. Mail the coupon now.

Junior Letters

Mother's Day Poem

Hoard's Dairyman Juniors:—I received your letter. My birthday comes on Nov. 11.

Here is a poem which I think would be nice to say at a program on Mother's Day. The name of it is "Mother:"

M stands for Mother and always will,
O means no Other her place could fill,
T means she'll Tell me everything right,
H means I'll Help her with all of my might.
E means she for Eternal mother-love stands,
R means she Ruleth with Godly hands.

Well, I will close with best wishes to the Junior Club. My address is Sturgeon Bay, Wisconsin. Julius Noll, Jr.

Likes Poultry Club

Hoard's Dairyman Juniors:—I joined the 4-H Poultry Club year before last. I raised chickens and when the club show came in the fall I took a pen of my chickens, one rooster, and two pullets. I got second on pen, first on both pullets, and second on rooster. With all the prize money together I got $9. I like club work very much. I am 12 years old and like to live on the farm. My address is Mt. Vernon, Ill. Woodrow Smith.

An Announcement—
To Buyers of Clean Dairy Cows

The Chicago Dairy Cow Exchange has been established as a market place for high quality, healthy, springing and fresh dairy cows.

It will Open at 9 A. M. MARCH 1

It is strictly a market place where buyer and seller can conveniently meet, where the breeder can send his cows to be sold and where the buyer can easily find what he wants.

We will have 100 Grade
GUERNSEYS and HOLSTEINS

for private sale at this market March 1st. Every animal is either fresh or a heavy springer. Only cows from accredited counties, accredited herds or herds that have passed a clean test are accepted at this market.

These cattle will come directly from the farms to our barn which is one of the horse barns of the International Live Stock Show. They are unloaded from the express track directly into our barn. Every shipment goes out in carefully cleaned, disinfected cars.

If you want healthy dairy cows from good herds, buy through the Chicago Dairy Cow Exchange.

Write us today for complete information. We would like to send you our booklet, "The Chicago Dairy Cow Exchange," that will explain fully the service that the Exchange can render you. It costs you nothing.

CHICAGO DAIRY COW EXCHANGE
REID MURRAY, Manager UNION STOCK YARDS **CHICAGO, ILL.**

Frost Teat Cups
for pump type milkers

Regardless of the size of the teat the patented construction of the Frost cup allows the teat to be perfectly braced during the entire suction stroke. These cups support and gradually massage all sizes of teats while the milk is being extracted. The action of the rubber liner produces the results of hand milking. Only one size necessary. Easy to clean, easy to assemble. Five-day money-back guarantee.

Every breed of dairy cattle, and horses, swine and poultry are also included. Book of 5,000 farm ranch and cottage names, 25 cents. HOARD'S DAIRYMAN ART DEPARTMENT, Fort Atkinson, Wis. 26-*

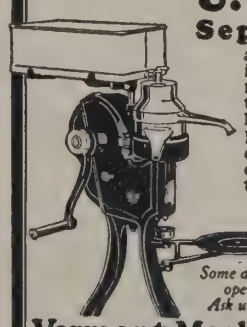
Minnesota Brown Swiss Breeders Meet

The annual meeting of the Minnesota Brown Swiss Breeders' Association, held Jan. 21 at University Farm, was one of the best attended meetings the association has ever had. Reports showed that the breed is constantly gaining strength in the state and the members have had an unusually good business during 1926.

The program included an excellent talk by Professor J. W. Gullickson.

Officers elected for 1927 are J. V. Segner, president; Jos. Verdick, vice-president; E. A. Ruehlke, secretary-treasurer.

Sets the Pace—



A Speed Indicator Bell on each United States Cream Separator regulates its operation.

Simple and positive in action, this device allows operators to maintain the required number of turns, only 42 or 48 per minute, and eliminates overwork and needless labor of excess speeds.

U. S. Cream Separators

are manufactured in seven sizes—motor or engine attachments for the larger sizes.

Prompt shipment can be made of complete separators or repair parts for any style.

Some desirable territories are open—perhaps yours. Ask us for terms to agents.

Vermont Machine Co. Inc.
BELLOWS FALLS, VERMONT, U.S.A.

"Holco" Ensilage Corn

Grows very tall, 14 to 16 feet, on good soil Some of our customers report having grown stalks 17 feet high. Very prolific, produces many large ears and makes the heaviest and thickest fodder. A big money maker for the Dairy farmer. Write for Catalog and prices.

FARROW CHIX FOR SUCCESS

WINTER EGG BANKING

Buyers of Farrow Chix start banking their winter receipts sooner than raisers of unknown Chix.

Our 200 egg strain are positive winter layers

MORE WINTER EGGS

This is the cry of thousands of poultry raisers. When eggs are high and profits the greatest you need Farrow Chix to fill the egg basket. Our Star Matings White Leghorns—bred to produce 200 egg pullets—can do this for you. A few dozen eggs in winter will more than pay difference in cost of these chix and common stock.

You can't get blood out of a turnip. Neither can you expect to have laying chix from non-laying hens. Be sure of winter eggs and order our Star Matings. They are winners in egg contests. They will win for you. Tancred, Hollywood, Barron blood lines. Chix from America's Wonder Layers.

Confidence, Service, Reliability --- 3 Million Farrow Chix a Season

Poultry on the Dairy Farm

Plan Now For 1928

HOARD'S DAIRYMAN:—To get eggs during the winter of 1927—1928 we must begin to plan our work now. June hatched chicks will not give us the greatest profits next winter. If we must skirmish around for a place to put our brooder stove just before the chicks come, or if the house for the laying flock is not in readiness until December or January, we will never be able to overcome our handicap.

Our egg yield this winter was the best we ever had. Beginning early in October our pullets rapidly increased their production until in December we found them giving us a sixty per cent yield which was continued right through the month of January when this was written. This was the period when egg prices were high and our flock gave us a substantial profit. Yet the plans for this period were laid almost a year in advance.

We placed our order for chicks in December, 1925, for at that time it so happened that we were able to call on our hatchery operator and talk matters over. We then placed our order to be delivered the week of April 5th. This hatchery has been on the accredited list of the Wisconsin Department of Markets since the inspection was begun and has furnished us with uniformly good stock for several years.

By April 1st our brooder houses were cleaned, disinfected, and moved on clean ground where no poultry had ranged for several years. The brooder stoves were installed and in working order. Chick guards were in the corners and a sheet of galvanized iron fourteen inches wide and ten feet long was ready to confine the chicks close to the hover during the first few days. Feed trays and drinking fountains were ready for use. An ample supply of ground yellow corn, standard middlings, pearl grit, and bone meal was on hand ready to be used in the Wisconsin chick ration or, as it is sometimes called, the 80—20 mixture.

Early in June the brooder houses were hauled out into a sweet clover pasture where the growing chicks remained for the summer. The health, vigor, and development of the flock on this range were indeed surprising. It is better to have the hawks an occasional bird in the field to lose a greater number from wo or disease on old infected groun

The cockerels were sold as soo the market would take them. S milk was fed freely until August when a few pullets began to lay. substitution of water for the s milk and heavier feeding on w grain checked the tendency of pullets to act as if they were gr up, thus holding down the produc of half sized eggs to the minimu

We profited by an expensive le two years ago when a laying h was started in August but not ished until late in November, so the pullets were not housed unt

PULLETS AT PASTURE ON THE BRILL FARM

snowstorm had made its appeara As a result the pullets came into production a month later than should have done, and a month's p it was forever lost. Last fall an dition to the first house was built was in shape to house the pullet October 1st. At that time, over s per cent of the pullets were grown, fat, and had a good comb velopment which indicated that were ready to go to work. T weeks later the remaining pu were brought home. Less crow quarters, with good feeding du this period, had also put them in shape for winter laying, and some skimmilk, a laying mash, a floor covered with litter in which scratch feed was scattered, the soon felt at home in winter q ters.

The results have been as we shown in the beginning of this cle. What we have endeavore show is that a high winter egg y is not due to a few last minute p or preparations, but is the result complete year round program lined nearly a year in advance.

Wisconsin. WALTER C. BRI

Minerals in the Ratio

Efficient feeding seems to be foundation upon which success any kind of live stock is based. one is unable to grow the young s to maturity or feed the mature mal for economical production, venture is bound to be a failure. should in all instances try to pro for less than the selling price, the margin between cost of pro

on and market price usually indi-
tes the profit. An understanding
this is necessary since price of
e feed is not the sole index. A
eap mixture may not always give
e highest returns.

A lot of well intended information
s been offered in the past that was
ly as true as conditions at that
ne allowed. It required the estab-
hment of the importance of miner-
s and vitamins to really allow a full
derstanding of feed combinations
d flock requirements.

One can compose an interesting
iry story by using the composition
an egg as a basis for feeding.
ith a known amount of protein in
egg and the same of grain, one
n determine how many bushels of
neat are required to make a dozen
gs. That is an amusing game for
me cold winter evening but doesn't
ad anywhere. It is just about as
tional to compile a ration on that
sis as to figure the speed of a car
the size tire that is used.

When a pullet is hatched there are hundreds of minute egg yolks combined into the cluster that is called the ovary. These resemble a bunch of grapes and vary in size from those so small that they are barely distinguishable up to that of the fully developed egg yolk. The ovary is located near the back, on the left side, between the lungs and kidneys. The number of these that can mature is probably determined by breeding and those that will by feeding and management.

When, by proper feeding, the yolk reaches maturity, it breaks from the skin that encloses it and drops into the oviduct.

The first deposit by the oviduct wall is the heavy, dense albumen called the chalaza that holds the yolk suspended. Many people think that this determines the fertility or infertility of an egg. In succession the heavy albumen, the two membranes, the shell, and then the watery albumen, which passes through the shell, are formed. Protecting the entire contents is the waxy coating given to the shell surface.

One can realize from this brief description that the formation of an egg is a manufacturing process whose success depends upon all necessary materials being available at the proper time. If it was possible to determine the maintenance needs of a hen we might from that determine the excess required for the production of an egg. Hens are considered as a flock unit rather than individuals and feeding must be supplied probably in excess of demands in order to assure a sufficient amount.

Probably the most neglected and least understood part of a ration is the mineral. We have dressed hens for the table and found bits of glass, stones, or crockery in the crop and decided that a set of false teeth were required. On that account hens have been fed gravel, coarse lime rock, or other material.

When a soft shell egg was produced it was usually thought that there was a shortage of oyster shell or lime rock. Real investigational work seems to show that a lack of calcium results not in soft shells but a lowered production. A hen, when her ration is restricted in the important mineral called calcium carbonate, does not produce a part of an egg but limits her production to what the materials available will permit. Production is limited only after she has utilized the reserve which she has established during a time of plenty.

In this work at the University of Wisconsin, the hens were kept under controlled conditions. Pullets were taken from range and placed on identical rations with exception of the grit material. No record was made until after the first two months to permit the oyster shell held in the crop to be utilized.

The following table taken from University of Wisconsin Circular 141 shows the egg production from the

ROUP CANKER

B-K saved me $3000

"B-K is used exclusively in our poultry house. Last year, as a result of having shown our Buffs at the leading shows of this country, they contracted chicken pox, and later on roup, and it looked as if we would lose every bird....We dipped them in a solution of B-K. We also sprayed each bird's mouth and cleaned up the entire flock and saved the day. **B-K in this one instance saved me $3,000.**"—W. D. James of the well known James Farms.

Give B-K in Drinking Water
Use as directed to spray and disinfect. Will prevent and stop roup, canker, "poultry flu" and other dread poultry diseases.
B-K is a safe, non-poisonous germ killer for roup and other respiratory diseases of poultry—also for white diarrhea, dysentery and similar diseases of baby chicks.
B-K is clear and clean. Leaves no odor. B-K is concentrated—costs about 1¼ cents per gallon of dilution ready for use. Buy a jug at your dealer's. Money back if not satisfied.

flocks with the grit materials indicated:

Table I—Eggs Produced With Different Grit Materials

Grit material	Eggs laid* first test	Eggs laid second test	Eggs laid third test
Oyster shell	1606	557	976
Clam shell			916
Dry bone	1033	507	
Lime rock grit	948	411	879
Quartz	577	221	324
Oyster shell, lime rock, and dry bone	1530	565	1115

*In the first test, the ration contained meat scrap with consequent higher egg production than secured in later years on a less palatable ration.

It will be noted that coarse oyster shell gave the best results in the first three tests. In the last three tests an attempt was made to find whether there was any difference when minerals were fed finely pulverized. The following table shows that the finely ground oyster shell in the last three tests gave poor results:

Table II—Eggs Produced

Mineral feed	Eggs laid fourth test	Eggs laid fifth test	Eggs laid sixth test
Oyster shell (coarse)	884	761	1364
Oyster shell (pulverized)	587	590	1056
Clam shell (coarse)	780	619	1255
Dry bone	450	587	814
Lime rock	515	472	846
Lime rock and potassium iodide	532	358	714
Calcium carbonate and potassium iodide	622	513	853
Calcium carbonate	439	493	745
Calcium phosphate		475	735
No mineral addition	210	388	693

An analysis of commercial oyster shell showed the presence of some iodine, so a small amount of potassium iodide was added. In the fourth test some slight advantage was noted but in the fifth and sixth no difference could be seen.

In the last three tests the minerals were balanced as to amount of lime and fed in the mash so that each lot received the same amount. As a standard it was assumed that the average laying hen consumed about 3½ lbs. of oyster shell each year.

From a study of the table one can readily conclude that an ordinary mica grit, stones, or coarse gravel will not replace coarse oyster shell. If one is to exercise a choice between a grit and an oyster shell, it is imperative that the coarse oyster shell be used.

Table 1 shows that the best results were obtained when oyster shell, lime rock, and bone were used.

A second mineral is salt. The amount of this to be added to a ration must be limited. The usual recommended is one per cent of fine salt added to the mash mixture. An excess can cause a heavy mortality in the flock but how high the amount can be carried is rather uncertain. One per cent undoubtedly satisfies the need for this essential and is safe.

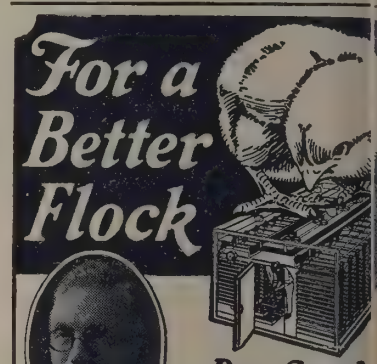
The addition of bone to a ration has been stressed more in chick mixtures than for hens.

Under certain conditions a bone addition to the ration may not be required. When animal protein is supplied by meat and bone meal or often meat scrap, the phosphates may be liberally supplied. The addition of raw bone to the ration under these conditions may not be imperative.

When, particularly, one is using milk as the one source of animal protein without supplementing from another source in the mash, it is necessary to add bone. Even though the experimental work along this line may be rather limited, it is advisable since the additional cost is rather low.

The ordinary ration is probably safer when slightly overloaded with minerals than lower in cost and le cient.

Other minerals may be found essary. At the present time it furnishes calcium carbonate or in coarse oyster shell and lime grit in hoppers; sodium chl which is fine table salt at the ra one per cent in the mash; ca phosphate—bone phosphate of —in bone, either hopper fed the mash, it will undoubtedl found that the mineral require of a flock are well supplied.



Oyster shell should be c When one finds the fine, silty ma feeding down into the hopper tr it should be removed and save the chick ration or thrown out low the hens access to the co shell.—J. B. HAYES.

Extension Work Reaches The Farmer

HOARD'S DAIRYMAN:—The extension work as carried on by the agricultural colleges, and particularly the county agent program, has come in for praise as well as criticism during the years since it has been established. Verbal battles have been waged and a good deal has been written relative to whether the county agent was of any value or simply a burden on the taxpayer. Sizing up the situation, as the writer has studied it in many states, we have concluded that the folks who never call on the county agent for assistance, and who never deign to attend either a meeting or a demonstration, are the ones who are the most insistent that a county agent is of no value in a community. On the other hand, the progressive, wide-awake farmers and their wives who are always in the forefront as regards up-to-date practices and who realize that agriculture is a business requiring brain work as well as brawn, are the people who believe that a county agent is a valuable asset.

It is always interesting to note that the people who are critical of colleges and of extension work in general, unconsciously perhaps, are often found growing a certain variety of grain, using a certain feeding practice, or using a certain practice in fighting a fungus disease or insect pest; all of which are the results of college research work. New practices come into a community slowly, and after a very few years have become a recognized procedure. Few people stop to trace the origin of practices, merely accepting them without thinking of the time and the trouble that may have been taken to test them out.

Dr. C. W. Warburton, once a specialist in cereals with the United States Department of Agriculture, but now director of extension work for the Department, gave an interesting address at the 1925 meeting of the American Society of Agronomy, relative to taking crops and soils lessons to farmers through extension work. Dr. Warburton reported that in 1923 actual statistics showed that, according to county agent reports, 70,059 farmers were following the advice of extension workers in the use of fertilizers. Farms adopting new or improved practices with crops that year were as follows: Corn, 171,000; wheat, 94,000; oats, 74,000; alfalfa, 56,000; soy beans, 80,000; sweet clover, 30,000; other clovers, 9,000; potatoes, 126,000; cotton, 86,000; and tobacco, 26,000.

For example, in New Jersey the research worker in plant diseases, the extension agronomist, and the county agents in the principal potato growing counties have co-operated for several years in a campaign for the introduction of certified seed potatoes. In 1921 only 6% of the seed potatoes sold by dealers were certified, while in 1924 85% of the seed handled by the same dealers was certified. The 1900 census in the state showed only 4 acres of alfalfa; this had increased to 1,200 by 1910 and to 19,000 acres by 1923, mainly the result of extension efforts.

In 1923 and 1924, the extension division of the U. S. Department of Agriculture co-operated with the extension forces of the states of California, Colorado, Iowa, and New York in trying to determine the effectiveness of extension work. In California, about 4 square miles were covered; in Colorado, the southern half of Logan County; in Iowa, five townships in Marshall County; and in New York the studies were made in two townships in each of three counties. In each of the counties studied a county agent and a home demonstration agent had been employed for several years. A total of 3,954 farms were studied in these areas.

Direct contacts between representatives of the extension service and members of the farm family were reported in the case of 69% of these farms. In a county where there had been a county agent for 12 years, 82% of the farms had been influenced by his work. In Iowa, 16% of all the farms had adopted a new practice in oat production and a like percentage in the production of soy beans. In Colorado, 24% had adopted new wheat varieties and 12% had changed some practice with reference to corn. In New York, smut treatment had been adopted by 25% and new practices in corn growing by 12%.

The principal methods by which people were induced to adopt the new practices were by adult demonstrations, 42%; meetings, 41.4%; indirect, 26%; news service, 10.9%; bulletins, 10%; farm visits, 9.8%; and office calls, 5.2%.

Nebraska. H. H. BIGGAR.

Limestone in Mineral Mixture

HOARD'S DAIRYMAN:—In your issue of November 25th the question was asked: "Why do cows chew wood if fed a mineral mixture?" I believe this is due to the minerals in the mixture not being in a digestible form. Wisconsin ground limestone is not digestible. Missouri or New York limestone is better. The mineral mixture I use will stop cows from chewing wood, although I have had people tell me the more mineral they feed the more wood the cows chew.

This chewing on wood will result in a sickness called "peca." Cows will get stiff and run down. The bones get honey-combed and brittle, and finally some of the bones break. A large number of cows in the northern part of Door County were afflicted this way last summer. I had five of these myself, but I saved them. The men from Madison killed one of these cows in this county and sent the bones back to Madison to be analyzed. They found a lack of phosphate. The disease seems to affect the younger cows first.

Wisconsin. CHAS. KROOGMANN.

Cows, however well bred or selected, which are unduly thin or out of condition do not make profitable returns from rations. It pays to keep cows in thrifty condition at all seasons of the year.—G. C. HUMPHREY.

AUCTION—MARCH 16

At Fond du Lac Sale Pavilion

Fond du Lac, Wisconsin

500 HEAD *Tuberculin Tested and ready for Inter-state shipment*

300 GUERNSEYS

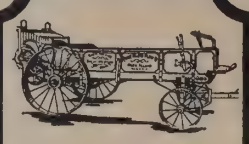
The Tight Bottom Spreader Without Gears

Equipped with the famous original "Great Western" continuous ratchet feed, beaters in an unusually advantageous position, and oscillating auto type front truck, a good job of spreading is certain under varying conditions with the—

Rock Island
Tight Bottom Spreader



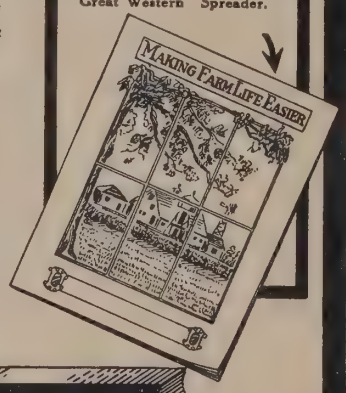
The Rock Island No. 1 spreads manure evenly its entire width—it covers the wheel tracks—its ratchet feed has been a success for over thirty years—a simple, positive, steady drive.

It is low down—easy to load—no projections above sideboards. Wide spread.

Auto-type oscillating front truck — short wheel base—close hitch—all four wheels under the load—better traction—lighter draft.

More links of drive chain in mesh when spreading—chain held away from sprocket positively when not spreading.

The next time you are in town ask your Rock Island Dealer about this spreader. Write us for free booklet describing it, and we will also send you a copy of our attractive catalog. Ask for free package C-51.

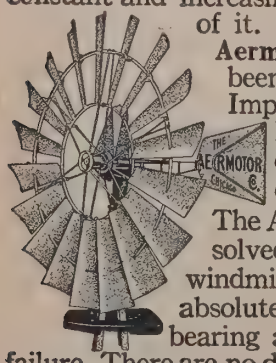


Rock Island "Great Western" Spreader

Manufactured by the Rock Island Plow Company—over 160,000 already on farms.

This is the endless apron spreader with patented end-gate and hood, beater in unusually advantageous position, and the original ratchet feed—a continuous drive used successfully for over thirty years.

Low-down — easy to load; short wheel base, close hitch, roller-bearings--all four wheels under the load—light draft.



Ask us for free booklet describing the Rock Island "Great Western" Spreader.

Rock Island
Plow Company - Rock Island, Ill.

A WONDERFUL SUCCESS

"Nothing succeeds like success," they say, but where success is constant and increasing there must be some unusual merit back of it. The continued success of the **Auto-Oiled Aermotor** is based entirely on merit. It has been made better and better year after year. Improvements have been added as experience has shown the way. The **Auto-Oiled Aermotor** of today is a wonderfully durable and efficient windmill.

The Aermotor Company, more than 12 years ago, solved the problem of complete self-oiling for windmills in such a way as to make the system absolutely reliable. The oil circulates to every bearing and returns to the reservoir with never a failure. There are no delicate parts to get out of order. The double gears run in oil in a tightly enclosed gear case.

CHICAGO KANSAS CITY **AERMOTOR CO.** DES MOINES OAKLAND DALLAS MINNEAPOLIS

Fast Grinding Low Cost

This mill has greater capacity per horse power, and grinds twice as fast and at less expense than any other type. Make big money grinding your own feed, graham flour and rye flour with a

have to be irrigated here, the rainfall being slight; but the soil is very fertile and with water almost anything grows in it.

The ceremonies before the fight consisted of a parade of the matadors, toreadors, and picadors. They marched before the executive box where a band played Spanish melodies, bowed, and received, officially, permission to slay the bulls. A detail of carbineros, or soldiers, were on hand to keep order.

A bugle blasted, the eyes of the 8,000 people present veered instantly in one direction, and in bounded the bull. He came out of a dark cell and it looked as if he had been thrown in. Catching his feet, he galloped forward and was met by one toreador with a gaudy mantel and then another. He partly rushed the first, forcing him behind a barrier—many of which are built around the arena, kicked half vicious and half playful at the second in passing, and snorted vehemently at the third, bringing up finally on the opposite side of the arena, the farthest distance away from his enemies.

He waited here until the toreadors caught up to him, blank with amazement, wild-eyed, and seeming to search the crowd over for a friend, and asking at same time, "What crime is mine, or why am I here?" While he was thus standing we found out that the fresh red rents on his body were inflicted while he was in a cage and that their purpose was to enrage him. The banderillas, edged like a porcupine quill, were thrust deep in his chine, and red welled around them and trickled down. And out of these darts burst explosives, resembling in report the ten-cent canon cracker of twenty years ago in Chillyville.

But there was no rest for this blue-roan with the Texas horns. They were surrounding him; he would have to try to understand what they wanted and then make the best of it, because there was no fence to hop over now, no running away. The toreadors outnumbered him 5 to 1, and, from their continued harrying and tantalizing, he suddenly began to hate them all; but which one to gore first was the question. When he started after one others interfered, and in the end he got desperately out of wind and confidence.

It was at this juncture that the bugle blew again and the matador comes forward to distinguish himself. To restore the bull with confidence in his own ability to charge, the picador comes in on a horse which is blindfolded over both eyes and led directly in front of the bull. The picador jabs the pike into the bull's crest and the horse consequently becomes the victim of the animal's rage. The destruction of the horse is grewsome, yet it is a scene in the spectacle for which the crowd seems to wait and observe with relish.

In the next act, the matador parries with the bull when the latter will parry with him, and this continues until the bull succumbs either from exhaustion and loss of blood or from the renowned stab.

There were six bulls slaughtered during the afternoon and several horses. A gang of foreign sailors were there and on one occasion when a bull flipped the matador, a rousing cheer went up for the principal with the horns, which sympathy for the principal without the horns the crowd failed to appreciate and a fight of another sort almost occurred.

It was dark when we reached the ship and on the well-deck of the Humming Bird there was the most disconsolate assembly of voices one could ever hope to hear. Little Prince of Time and Lady Della and Gene were thinking apparently that I had gone away and left them forever.

[EDITOR'S NOTE:—This is the fourth of a series of six articles by Mr. Beattie. The next will appear in an early issue.]

Oregon Cow Breaks State Record

Graymere Erdine, a full sister to Graymere Alice, the world's champion Jersey yearling in the 305-day division, has completed her second official production test with a gold medal and state championship record. Graymere Erdine is owned by M. N. Tibbles of Oregon. Erdine was started on her latest test when she was 3 years and 10 months of age, and in the following 305 days she produced, with calf, 724.26 lbs. fat and 10,732 lbs. milk.

On her first test made in junior two-year-old form, Erdine produced 657.10 lbs. fat and 9,377 lbs. milk in 365 days. Graymere Erdine's record is the second highest Jersey record in this age class.—The American Jersey Cattle Club.

"Speech was given man to conceal his thoughts."

use modern style bevel siding on your farm buildings.

Add to their appearance, long life and market value by siding them with straight, smooth enduring Western Red Cedar.

With or without paint this remarkable wood is proof against storm or sun — its unusual insulation value makes buildings sided with it warmer in winter and cooler in summer. It is light, easy to work and will not warp, swell, shrink, buckle or check.

Cut from the giant cedars of the Pacific Northwest, it is Nature's supreme outside wood — rot resisting, easy to nail without splitting.

Write for useful information about farm building.

Scale of Points for Guernsey Cow

Style and Symmetry: Attractive individuality revealing vigor, femininity and breed character; a harmonious blending and correlation of parts, an active well-balanced walk	5
Head: Moderately long, clean-cut, showing femininity and breed character; a lean face; wide mouth and broad muzzle with open nostrils; strong jaw; full bright eyes with gentle expression; forehead broad between the eyes and moderately dishing; ridge of nose straight	5
Horns: Yellow, small at base; of medium length; inclining forward; not too spreading	1
Neck: Long and thin; clean throat, smoothly blending into shoulders	2
Withers: Chine rising above shoulder blades, with open vertebrae	2
Shoulders: Shoulder blades set smoothly against chine and chest wall, forming neat junction with the body	2
Chest: Wide, and deep at heart with least possible depression back of shoulders	4
Back: Appearing straight from withers to hips	5
Loin: Strong, broad, and nearly level laterally; width carried forward to junction with the ribs	3
Hips: Wide, approximately level with the back; free from excess tissue	2
Rump: Long, continuing with level of back; approximately level between hip bones and pins. Pins well apart	4
Thurls: Wide apart and high	2
Barrel: Deep and long with well-sprung ribs. Individual ribs: Long, flat, wide apart, and free from excess tissue	10
Thighs: Incurving when viewed from side, thin, and wide apart when viewed from rear; well cut up between the thighs	2
Legs: Flat, flinty bone, tendons clearly defined; front legs straight; hind legs nearly upright from hock to pastern, set wide apart and nearly straight when viewed from behind. Pastern strong and springy	2
Skin: Loose and pliable, and not thick, with oily feeling; hair, fine and silky	3
Tail: Long, tapering, with neat, strong, level attachment, neatly set between pin bones; fine bone and hair; nicely balanced switch	2
Udder: Uniformly fine in texture; free from meatiness; covered with pliable velvety skin	3
Veins prominent	1
Attachment to body, strong, long, and wide	4
Extending well forward; extending well up behind	4
Sole; level between teats	2
Teats of even convenient size; cylindrical in shape; well apart and squarely placed, plumb	3
Mammary Veins: Long, tortuous, prominent and branching with large numerous wells	3
Secretions Indicating Color of Product: Indicated by the pigment secretion of skin which should be a deep yellow inclining toward orange in color; especially discernible in the ear, at the end of bone of tail, around the eyes and nose, on the udder and teats, and at the base of horns; hoofs and horns amber color	20
Color Markings: A shade of fawn with white markings	2
Size: Mature cows about 1,100 lbs. in breeding condition	2
Total points	100

Scale of Points for Guernsey Bull

Style and Symmetry: Impressive, showing vigor, masculinity and breed character; a harmonious blending and correlation of parts; an active, well-balanced walk	10
Head: Clean cut, showing masculinity, refined character, lean face, wide mouth and wide muzzle, wide open nostrils, and bright masculine eyes. Broad between the eyes and moderately dishing. Bridge of nose straight	6
Horns: Yellow, small at base, medium length, not too spreading	1
Neck: Long, masculine neck with moderately strong crest, smoothly blending into shoulder; clean throat	3
Withers: Chine rising above shoulder blades, with open vertebrae	3
Shoulders: Shoulder blades set smoothly against chine and chest wall, forming neat junction with the rest of the body	2
Chest: Wide and deep at heart with least possible depression back of the shoulders	4
Back: Appearing straight from withers to hips	8
Loin: Strong, broad and neatly level laterally; width carried forward to junction with the ribs	3
Hips: Wide apart, not too prominent	2
Rump: Long, continuing with level of the back, also level between hip bones and pin bones. Pin bones well apart	6
Thurls: Wide apart and high	2
Barrel: Deep and long with well-sprung ribs. Individual ribs; long, flat, wide apart and free from excess tissue	10
Thighs: In-curving as seen from side, thin and wide apart from rear; well cut-up in the twist	2
Legs: Flat flinty bone; tendons clearly defined; front legs straight; hind legs nearly upright from hock to pastern, set wide apart and nearly straight when viewed from behind. Pastern, strong and springy	2
Skin: Loose and pliable; medium in thickness; hair fine and silky	5
Tail: Long, with neat, strong level attachment; neatly set between pin bones	2
Rudimentary Teats: Teats wide apart and squarely placed and free from scrotum	2
Rudimentary Veins: Well defined and prominent; with large and numerous wells	3
Secretions Indicating Color of Product: Indicated by the pigment secretions of the skin which should be a deep yellow inclining toward orange in color; especially discernible in the ear, at the end of the bone of tail; around the eyes and nose, on the scrotum and at the base of horns; hoofs and horns, yellow	20

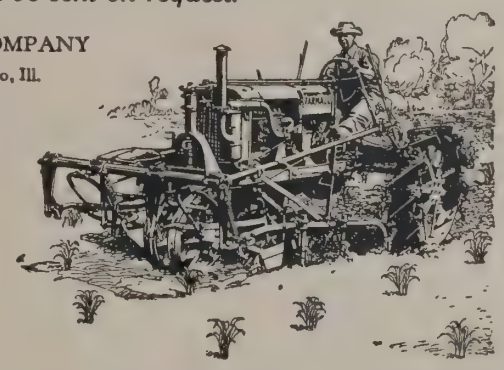
McCormick-Deering Tractors

Two sizes, 10-20 h. p. for 2 plows, and 15-30 h. p. for 3 plows. Fully equipped, 4-cylinder tractors, with ample power at belt, drawbar, and power take-off.

Next Spring—

Summer, Autumn, Winter—Profit with McCORMICK-DEERING Tractor Power

EVERY YEAR McCormick-Deering Tractors stand stronger with the farmers. The name McCormick-Deering has become the symbol of reliable power farming because it stands for carefully built, practical, many-sided, long-lived farm power.



That is so in your community and everywhere. Men who have used International Harvester tractors—for months or for years—are steadfast friends of McCormick-Deering farm power. They will recommend McCormick-Deering when you come to buy. Other men, who risked using cheaper, lighter tractors, found themselves underpowered. They fell short of reaching full production with the least possible labor and in the shortest possible time. After this experience they were ready for new and better power. There are thousands like these, too, who will recommend McCormick-Deering when you make your power investment.

McCormick-Deering gives you your choice of three tractors—the McCormick-Deering 10-20, the 15-30, and the new all-purpose row-crop tractor, the FARMALL. All are quality tractors, built to last many years. Any one of them will work for you with *drawbar, belt,* and *power take-off* the year around. Any one of them will cut your producing costs and add to your profits. Look them over at the dealer's store. *Catalog will be sent on request.*

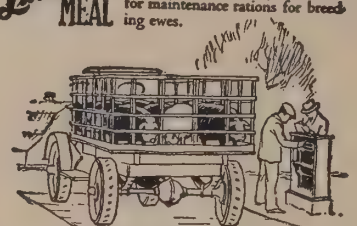
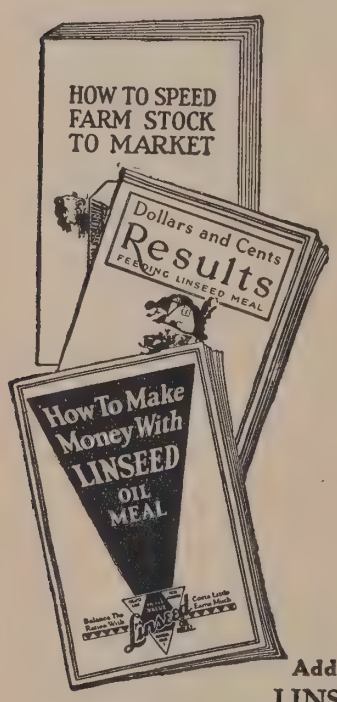
When—

Linseed Meal constitutes as high as 33% of the grain rations used by successful feeders, dairymen and breeders—

When these same men tell you that Linseed Meal pays as high as 100% there must be some reason for it.



Linseed MEAL —shows a good profit when added to rations for dairy cows. Helps raise calves economically.



Linseed MEAL —hastens prime market condition for beef and shows a good profit on the investment.

Linseed MEAL —pays good profits when added to rations for fattening lambs and for maintenance rations for breeding ewes.

Linseed MEAL —proved worth $85.00 per ton feeding value in recent experiments, saved month's time in securing market weight of 200 pounds and solved fall pig problem by giving 2 1/2 pounds daily gain without scourage.

These books tell how and why —get any or all of them— free

The Herd in Good Condition

HOARD'S DAIRYMAN:—The three high herds for January in the Richland Association of Wisconsin tell a story of how good condition reduces the cost of production.

The high herd consisted of 16 Guernseys, all but one fresh before November. The herd produced 919 lbs. milk and 41.3 lbs. fat per cow, at an average cost of $9.10 for feed. The herd was in good condition. Cows were fed one pound of mixed hay and three pounds of silage per 100 lbs. live weight. On the average the cows were fed 9 lbs. daily of a grain mixture that was charged to them at $33.95 a ton. The grain mixture consisted of 25 lbs. oats, 25 lbs. corn, and 50 lbs. of a 16% dairy ration, a half pound each of linseed meal and cottonseed meal being fed in addition.

The second high herd consisted of 16 Holsteins, all but three being fresh before November. This herd was not in the best of condition, but produced 1,228 lbs. milk and 40.5 lbs. fat per cow at a cost of $11.77 for feed. This is $2.67 higher feed cost per cow with nearly a pound less fat produced. Cows were fed 3.5 lbs. silage per 100 lbs. live weight and all the mixed hay they would eat. On the average, cows were fed 12.7 lbs. a day of a grain mixture that was charged to them at $33.90 per ton. The grain mixture consisted of 25 lbs. corn and cob meal, 20 lbs. oats, 20 lbs. bran, 20 lbs. linseed meal, and 15 lbs. cottonseed meal.

Third high herd consisted of 16 Holsteins, all but two fresh before November. The herd was in fair condition and produced 1,075 lbs. milk and 38.5 lbs. fat per cow, at $8.61 for feed. Cows were fed 3.6 lbs. silage per 100 lbs. live weight and all the mixed hay they would consume. On the average cows were fed 7.3 lbs. a day of a grain mixture charged to them at $33.20 per ton. The grain mixture consisted of 20 lbs. hominy, 30 lbs. oats, 20 lbs. bran, 10 lbs. linseed meal, and 10 lbs. cottonseed meal.

By studying the figures we find the high herd, which was in good condition and fed closely to the usual requirements as to grain and roughage, made $5.97 per cow more above feed cost than the second high herd m $1.33 more than the third high h The third high herd made $4.64 m per cow above feed cost than the c ond high herd. This goes to s that overfeeding doesn't pay, and a cows in good condition produce s on less feed. Proper feeding and c make the most profits.

PETER NELSON, TESTE

Retests in Minnesota

HOARD'S DAIRYMAN:—The testg of cows by the usual cow testg method, particularly in the leadg dairy states, is rapidly passing fr the early educational and demonstr tion type to one that places a co mercial value on the records. Te value of cow test records is in dir proportion to the confidence e public places in them. To prode the kind of records that will co mand the confidence of the pub requires the application of standd rules and regulations for the condt of associations. To that end, e state supervisors of cow testing h been working the past years, gradu ly securing uniformity in the rus and their enforcement.

Unusually high records for indiv ual cows or herds for a given mon are sometimes questioned. Ts should not be, as it tends to destr confidence in the records. The bt solution of the problem lies in a t test made after the regular test t verify the original production. Ts test is made by the regular tester charge on request of the state sup visor. Preliminary reports are mad by the tester on testing day to te state supervisor who then determis whether or not a retest is necessa The application of the rule is nt compulsory. Each association decis for itself as to whether or not it esires to have the retest rule appli Statewide and local publicity will e given the fact that certain assoc tions are availing themselves of te retest privileges.

Seven associations in Minnes have officially indicated their des to adopt the retest rule. They a as follows: Owatonna No. 1, Morg Pope County No. 1, Howard Lal Montrose, Yellow Medicine, and R

ing. The officers and directors of e association may decide the ques-on of retesting in their association.

Rules of the Retest

1. Preliminary reports for cows ilked twice daily producing 70 ounds fat for the month, and for ows milked three or four times pro-ucing 80 pounds fat, and for herds which the milking cows average er 45 pounds fat are made to the ate supervisor by the cow tester.
2. From these detailed reports, the pervisor decides the advisability of retest.
3. When a retest is called for, it ould, if possible, be made within n days of the original test.
4. All tests and taking of samples d weights of milk shall be made by e tester himself. Milk samples all be kept under lock and key.
5. Cost: Each member for whom a test is made shall pay the cow test-two dollars for conducting the re-st. Note: (This charge was agreed on by the six associations men-oned as reasonable to the member d fair to the cow tester.)
6. Any member refusing to retest pay the tester for same shall have l local and state publicity on his rd withheld from date of such called r retest until the close of the test-g year. His records are entered in e herd book each month thereafter, t do not become a part of the state association annual report.
7. The state supervisor shall decide to whether or not an average be-een the original and the retest shall used for credit to the test period volved, or the retest result alone all be used. On completion of re-st the tester shall make a complete port to the state supervisor.
8. Each association should not ve more than twenty-six or twenty-ven members in order that the cow ster may have time to conduct the ests if called for.

Minnesota. E. A. HANSON.

High Cows By Breeds

Mr. E. V. Jackson of Michigan has ade a compilation of the records of gh cows appearing on this page for e last half of 1926. The averages all reports for six months are, olsteins 37.8 pounds fat, Guernseys 38.5 pounds fat, and Jerseys 38.9 pounds fat. The high period for the Guernseys was in the July 10th issue when their average was 48.6 pounds fat. Holsteins were high in the July 25th issue with 45.4 pounds fat, and the Jerseys were high in the August 25th issue with 44.1 pounds fat. It is interesting to note that the highest average records appeared during the first three months.

Different Values Secured

HOARD'S DAIRYMAN:—Many different advantages of cow testing association work are shown by a brief summary of last year's testing in the Kent—Grand Rapids Association of Michigan.

Take the man with the grade herd of 15 head. We look over his herd book and see that 10 of his cows are eligible for a Record of Performance certificate. Perhaps he wants to buy two new cows. If so, he knows just which ones he wants to sell and what he needs to buy in order to bring his herd standard up to normal again. He is pleased with his records because they meet the requirements set by the State College. Realizing the results of a successful year's work, he strives for a 100 per cent R. O. P. herd next year.

The next farmer strives for heavy milk production the year around. When cows fall off in production, he must get rid of them because his milk supply must be constant. By selling these cows on their C. T. A. records of five or six months, he is able to get far better prices than if no records were made. The use of a pure-bred bull for the breeding of these cows pays for itself many times over. He now buys a new milk cow. He has her tested to see that her milk is up to standard. By this method and shrewd dealings a very businesslike dairy is carried on.

The farmer whose herd consists of pure-bred cattle benefits greatly by C. T. A. work. He watches the milk production, feed costs, and economical production of milk or fat with great eagerness. He feeds to improve his breeding stock along production lines. He takes great pains in the balancing of his rations and is ever on the job. His C. T. A. records are the foundation of his sales on a production basis.

Then, as in almost every other walk of life, we have the man who joins the association because his neighbor does. He goes through a year's work half heartedly, receiving the tester and what help he offers in an indifferent way. Of course he listens to suggestions, but when next month rolls around and things are just the same it is evident he doesn't care.

Cow testing work can be made the most of by the farmer taking a real interest in the work.

Michigan. WM. BURTON TAYLOR.

Valuing Cows

"We appraised our cows last November," writes a Minnesota member," on basis of what each brought in above feed cost during previous year. We would be pleased to know the views of others as to values in a dairy herd taking them as they run, young and old; also, values based on age and production."

None In Sight

Traffic Cop: "Say, you. What do you mean speeding along the road like a madman? You'll kill somebody. Why in blazes don't you use your noodle?"

New Driver: "Noodle? Noodle? Where in heck is the noodle? I pushed and pulled everything on the dashboard and nothing would stop her."

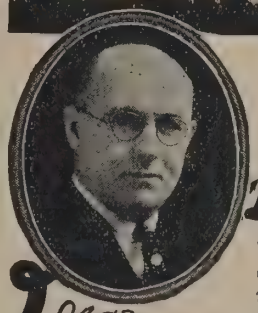
Cleaner Bottles

Faster-Cheaper-With the **FORT ATKINSON** *WASHER and STERILIZER*

CLEAN bottles are just as necessary to the success of smaller milk plants and farm dairies as they are to large city plants. Clean bottles build good will and hold customers.



The Fort Atkinson Bottle Washer and Sterilizer is intended for plants washing 500 to 2000 bottles per day. It is simple and efficient—anyone can operate it. Heavy construction eliminates trouble and adds to life of machine.

The price is low enough so that any plant that needs one can afford it. Write for complete information and prices.

TWO Valuable Books for YOU

H. A. James PRESIDENT

If you are thinking of building, remodeling, ventilating or buying any equipment for your cow or horse barn, hog or poultry house, write for these two books. These books tell how we help you plan and equip your buildings to make them more convenient, practical and economical—how we save you money by cutting down material and construction costs. These books also describe the complete line of Jamesway Equipment, Stanchions, Litter Carriers, Drinking Cups, Calf and Bull Pens—also Feeders, Brooders, Waterers, Steel Nests, etc.—a line of equipment that is unequaled for durability, service and economy.

Fill Out and Mail Coupon Now

Just fill out the coupon—tell us what you are interested in and we will send you the necessary literature containing full particulars of Jamesway Equipment and Jamesway service. Don't build, remodel or equip any farm building until you get these valuable books and learn how we can save you money. Mail coupon to office nearest you.

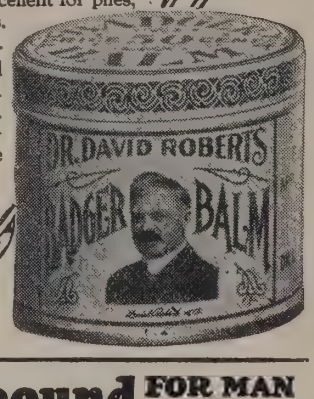
WHY did we so easily sell tons of Badger Balm last year and why will we sell many more tons this year? The answer is obvious. Our customers like it and recommend it. Badger Balm is a pleasing, soothing, healing antiseptic balm, easily applied and positively gives satisfaction.

If you have ever used Badger Balm, we know you are using it now. If you have never used Badger Balm, get a box, try it, — you will then, like thousands of others, become a constant user.



For Veterinary Use

Sore teats, Cow Pox, and chafed udders in cows; Scratches, cracked heel and inflamed swellings in horses and other domestic animals.

For Family Use

Chapped hands, sore feet, chilblains, frost bites, sunburn, Salt Rheum, Eczema, and many other forms of skin diseases. Also excellent for piles, hemorrhoids, sore or inflamed breasts and scalp ailments.

Here's Our Offer Use Badger Balm as directed. If you are not satisfied with it, your money will be refunded without argument. Ask your dealer. If he does not have it, send direct. Price post paid 50c. Badger Balm is one of 44 prescriptions Dr. Roberts has used successfully in his practice for more than twenty-five years.

Write for free copy of The Cattle Specialist and how to get the Practical Home Veterinarian without cost. Veterinary advice free.

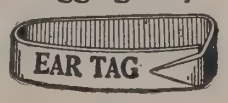
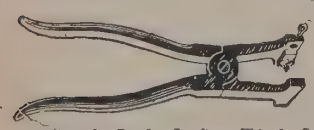
We Needed One and So Do You



Many times at sales, farmers' meetings, on the street, in hotels, on trains and even at dances we have been asked for information regarding the Hoard's Dairyman herd. We missed many sales because we could not give our friends and new acquaintances all the information they wanted in definite form. In order to "be prepared" for these emergencies we planned the Hoard's Dairyman Vest Pocket Herd Book. The demand for them is exceeding our highest expectations The investment of $2.00 will come back to you many times and the satisfaction of having "your figgers" right handy is worth much more than the cost of the book.



Will accommodate 100 head. Loose leaves (easy to remove but firm during use); good leather cover; index, sketches, records breeding, service records, gestation table and blank pages for memoranda. All sent postpaid for $2.00.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Mysterious Lameness

When a cow or other bovine beast gradually becomes lame or stiff and a careful examination fails to disclose the cause, it is, in our experience, always well to apply the tuberculin test for the reason that tuberculosis not infrequently causes just such symptoms. It does not always attack the lungs, and tuberculosis of the udder is comparatively rare; but it may locate in unexpected places. Of these, the bones, joints, and skin must be taken into account. Skin lesions, in fact, are sometimes the unsuspected seat of the disease and may account for some of the unsatisfactory cases in which reactors fail to show plain evidences of the disease at the time of slaughter and expert examination. The vertebrae or segments of the backbone, at the loins, occasionally become affected with tuberculosis, although the disease, in such cases, may also be present in other parts of the body. When the bones of the loins are affected, the animal has difficulty in rising and may also walk stiffly and possibly sway more or less during action. We have seen such tuberculous disease keep a cow from rising after calving and it is doubtless present in some of the supposed paralysis cases of the cow before calving, or at some other time. It is, of course, incurable and the possibility of its presence and immediate detection by the tuberculin test saves misdirected treatment, time, and expense.

Another apparently favorite place for the disease to locate is the fetlock or ankle joints. The affected animal is slow in gait, sluggish, or listless. The joints are swollen, but they are not hot, sore, or much puffed. Evidently, there is hidden or occult disease of the bones forming the joints and tuberculosis is insidious in its character and progress and the cause of what are sometimes called "cold swellings." In one instance, where two veterinarians had made a careful physical examination of several hundred cows in a certified milk dairy and set out the cows they suspected might be infected with tuberculosis, a third, who made a final examination of the remaining cows, noticed that three of them showed swollen fetlocks and stiffness or slight lameness. These cows were also set apart and when the tuberculin test was applied two of them were found to be tuberculous while all of the other suspected cows failed to react. The physical examination was simply made to determine how correctly tuberculosis may be detected in that way. The setting apart of the three mysteriously lame cows was merely an afterthought; but the discovery that tuberculosis was the cause of the swelling and lameness of the fetlock joints was an "eye-opener" to the three experts.
